Bartoli, Matteo Giulio (1873–1946)

J Albrecht, Ryprecht-Karls-Universität, Heidelberg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Mattio Giulio Bartoli, one of the founders of the so-called 'Neolinguistic school,' was born September 22, 1873 in Albona d' Istria (now Labin in Croatia), then a small Italian-speaking town in the Istrian province of the Austro-Hungarian empire. Having grown up in the diaspora, he became a fervent Italian nationalist, using linguistic and ethnological arguments to defend the 'Italian character' of his native Istria.

Bartoli studied classical and romance philology in Vienna, Strasbourg, and Paris. Among his masters were the heads of two linguistic schools in conflict, two outstanding scholars, Wilhelm Meyer-Lübke (*see* **Meyer-Lübke, Wilhelm (1861–1936)**) the doyen of the second generation of the Neogrammarians, and Jules Gilliéron (*see* **Gilliéron, Jules (1854–1926)**), one of the founders of linguistic geography.

In 1907, Bartoli became professor of Classical and Romance Philology at the University of Turin; for a time he also taught general linguistics and German language and literature. One of his best students was Antonio Gramsci, the founder of the Italian Communist Party. Starting in the early 1920s, Bartoli dedicated a good deal of his time to the Italian linguistic atlas (*Atlante Linguistico Italiano*), which was continued by G. Vidossi, B. Terracini, and C. Grassi (vol. 4 published in 1997) after Bartoli's death in 1946. From 1926 onward, Bartoli also directed the romance philology section of the *Archivio glottolegico italiano,* one of the most prestigious philological

reviews of his country. From 1929–1946, he was the Italian representative of the Permanent International Committee of Linguists.

Together with Giulio Bertoni (*see* **Bertoni, Giulio (1878–1942)**), Bartoli was one of the heads of the so-called 'Neolinguistic school.' His main contribution to linguistic theory was a negative one; it consisted in his resolute opposition to the Neogrammarians's doctrine of the so-called 'phonetic laws'. Deeply influenced by the Italian philosopher Benedetto Croce (*see* **Croce, Benedetto (1866–1952)**), Bartoli and his followers were convinced that language, being a human creation, cannot be reduced to an entity separate from man and governed by greater rules other than those created and imposed by the speakers themselves. However; in the late 20th century, the differences between Bartoli and his master Meyer-Lübke appear not as marked as contemporaries felt them. Both Neogrammarians and Neolinguists fit the same paradigma, i.e., comparative historical linguistics, showing little interest in the systematic, ahistorical approach to language initiated by Ferdinand de Saussure (*see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and Leonard Bloomfield (*see* **Bloomfield, Leonard (1887–1949)**), both equally 'rebellious disciples' of the Neogrammarians.

With regard to methodology in the field of comparative historical linguistics, Bartoli was responsible for the important insight that the features shared by two or more languages or dialects have to be interpreted in different ways, since they may be due either to common preservations or to common innovations. Only the latter can be regarded as testimony to a common historical development of the respective dialects.

Bartoli's description of 'Dalmatian,' i.e., the surviving traces of the Neo-Latin language of Pre-Venetic Dalmatia (see Bartoli 1906) was reprinted in 1975, and is the best evidence of its continuing relevance. Of special interest remains also his characterization of Latin as a particularly archaic Indo-European language (see Bartoli 1945: I).

Bartoli died in Turin on January 20, 1946.

Bashkir

L Johanson, Mainz University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Bashkir (*bašqort tĕlĕ, bašqořtsa*) belongs to the northern group of the northwestern, or Kipchak, branch of Turkic. Its main area of distribution is the basin of the Belaya River and the southwestern slopes of the Ural Mountains. The Republic of Bashkortostan, or Bashkiria (*Bašqortostan Respublikahï*), which belongs to the Russian Federation and whose capital is Ufa (*Öfö*), borders on Tatarstan, the Udmurt Republic, and the Orenburg, Perm, Sverdlovsk, and Chelyabinsk regions. Of the more than 4 million inhabitants of the Republic, Bashkirs make up only 22%. Other groups include Russians, Tatars, Chuvash, Udmurts, Mari, and Ukrainians. Bashkir-speaking groups are also found south of Kuybyshev and east of Ural, in the regions Orenburg, Chelyabinsk, Samara, Kurgan, and Sverdlovsk. The total number of speakers of Bashkir is about 1.4 million.

Bashkir

L Johanson, Mainz University, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Location and Speakers

Bashkir (*bašqort tĕlĕ, bašqořtsa*) belongs to the northern group of the northwestern, or Kipchak, branch of Turkic. Its main area of distribution is the basin of the Belaya River and the southwestern slopes of the Ural Mountains. The Republic of Bashkortostan, or Bashkiria (*Bašqortostan Respublikahï*), which belongs to the Russian Federation and whose capital is Ufa (*Öfö*), borders on Tatarstan, the Udmurt Republic, and the Orenburg, Perm, Sverdlovsk, and Chelyabinsk regions. Of the more than 4 million inhabitants of the Republic, Bashkirs make up only 22%. Other groups include Russians, Tatars, Chuvash, Udmurts, Mari, and Ukrainians. Bashkir-speaking groups are also found south of Kuybyshev and east of Ural, in the regions Orenburg, Chelyabinsk, Samara, Kurgan, and Sverdlovsk. The total number of speakers of Bashkir is about 1.4 million.

Origin and History

The Bashkirs previously lived farther to the east, in West Siberia, first as subjects of the Volga Bulgar state and, after 1236, under Mongol rule. They reached their present-day territory under the Golden Horde. With the disintegration of the Golden Horde, the Bashkir territory was divided between the three khanates of Kazan, Noghay, and West Siberia. Bashkirs and Tatars came under Russian rule at the end of the 18th century. In 1919, a Bashkir Autonomous Soviet Socialist Republic was established. In 1992, Bashkortostan became an autonomous republic within the Russian Federation.

Related Languages and Language Contacts

Bashkir is closely related to Tatar and constitutes a connecting link to Kazakh. The different origins of its speakers are reflected in heterogeneous linguistic features. Since Bashkir and Tatar varieties have been in close contact for many centuries, the boundaries between them are not always clear.

The Written Language

The Bashkirs used a local variety of Chagatay as their written language until the beginning of the 20th century, when they adopted written Tatar. A Bashkir standard language, mainly based on the eastern (Kuvakan) dialect, was established in the Soviet era. The Arabic script was replaced in 1929 and 1930 by a Roman-based script. The Cyrillic-based script system that was introduced in 1939 and 1940 differs considerably from the script of the Tatar system.

Distinctive Features

Bashkir exhibits most linguistic features typical of the Turkic family (*see* **Turkic Languages**). It is an agglutinative language with suffixing morphology and a head-final constituent order (subject-object-verb). In the following discussions, some of the distinctive features of Bashkir will be dealt with, with focus in particular on certain comparisons with Tatar.

Phonology

The Bashkir vowel system is very similar to that of the Tatar system. It comprises fully articulated and reduced vowels and exhibits the same systematic vowel shifts. Thus, low vowels of the first syllable have been raised: *e* > *i* (*hin* 'you' (<*sen*)), *o* > *u* (*yul* 'way' (<*yol*)), *ö* > *ü* (*hüδ* 'word' (<*söz*)). High vowels have been centralized and reduced: *i* > *ĕ* (*tĕδ* 'knee' (<*tiz*), *u* > *ŏ* (*moron* 'nose' (<*burun*)), *ü* > *ŏ* (*kŏn* 'day' (<*kün*)).

In its consonant system, Bashkir differs from Tatar and approaches Kazakh. Thus, *č* has developed to *s* (*kis* 'evening' (Tatar *kič*), *sĕs* 'hair' (Tatar *čĕč*)). Word- and suffix-initial *s* has developed to *h* (*harï* 'yellow' (Tatar *sarï*), *bul-ha* 'if it is' (Tatar *bul-sa*)). In other cases, *s* has developed to θ (*ki* θ 'to cut' (Tatar *kis*)). The corresponding voiced sibilant *z* has developed into *δ* (*δur* 'big, great' (Tatar *zur*), *hüδ* 'word' (Tatar *süz*)). Interdental sibilants are also typical of Turkmen. Bashkir exhibits word-initial *y-* in cases in which Tatar has *ǰ* (*yĭlĭ* 'warm' (Tatar *(ǰĭlĭ*)). This phenomenon also affects old loanwords, e.g., *yen* 'soul' (< Persian (*ǰa:n*, cf. Tatar *ǰan*). In its vowel harmony system, Bashkir is similar to Turkmen, Kirghiz, and some other languages in that low suffix vowels are rounded after a rounded vowel in the preceding syllable, e.g., *bŏlŏt* 'cloud' (Tatar *bŏlĭt*), *ŏsŏn* 'for' (Tatar *ŏčĕn*).

The rules for consonant assimilations are much more complicated than they are in Tatar. Suffix-initial consonants may have up to four variants (plural *qala-lar* [city-PL] 'cities,' *at-tar* [horse-PL] 'horses,' *kül-der* [lake-PL] 'lakes,' and *taw-δar* [mountain-PL] 'mountains,' or ablative *qala-nan* [city-ABL] 'from the city,' *taw-δan* [mountain-ABL] 'from the mountain,' *at-tan* [horse-ABL] 'from the horse,' and *yalan-dan* [steppe-ABL] 'from the steppe'). The third-person personal pronouns are singular *ul* 'he, she, it' and plural *ular* 'they' (Tatar *ul*, *alar*). The oblique stem of *ul* is *un-* (Tatar *an-*). The demonstrative pronouns include *bĭl*, *bĭnaw* 'this,' *ošo* 'this here,' and *šul*, *ul*, *anaw*, *tĕgĕ* 'that.'

Dialects

Bashkir has a few main dialects and numerous subdialects. The eastern or mountain (Kuvakan) dialect comprises the subdialects Ay, Argayash, Salyut, Miyas, and Kizil. The southern (Yurmat) group comprises Ik-Sakmar and the central dialect group comprises Kara-Idil and Dim. There are important differences between the eastern and southern dialects. The steppe, or southwestern, dialects have been strongly influenced by Tatar.

Basque

J I Hualde, University of Illinois at Urbana-Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Basque (Euskara) is the only remaining vestige of the linguistic situation in western and central Europe before the Indo-European expansion. Although many attempts have been made to relate Basque to other languages of the world, none of them is generally considered to have been successful. Genetic links with the Finno-Ugric family, the languages of the Caucasus, or any other living language for which some scholars have sought a genetic relationship with Basque would be so remote that no solid proof is likely to emerge.

As for the extinct language of the ancient Iberians, once spoken along the Mediterranean coast of Spain and known to us from a relatively large number of inscriptions, the fact that Basque has been of little help in deciphering these inscriptions forces us to discard the hypothesis that the two languages are closely related (although they do share a number of phonological and morphological features, attributable to areal phenomena). Basque is thus a language isolate.

Throughout its known history, Basque has been spoken in an area of variable extent on both sides of the western Pyrenees and along the coast of the Bay of Biscay. The present-day Basque-speaking area (*Euskal Herria*) corresponds to parts of three different administrative units, two in Spain and one in France. There are currently approximately 700 000 speakers of Basque, almost all fully bilingual in either Spanish or French. The largest number of speakers is found in the Autonomous Community of the Basque Country (ACBC), which comprises the provinces of Bizkaia, Gipuzkoa, and Araba (in Basque)/Alava (in Spanish). Here Basque is co-official with Spanish and has an important presence in the educational system. In this region, the number of Basque speakers is growing in areas where the language is natively spoken by part of the population as well as in other areas, such as the city of Bilbao and most of Araba/Alava, where the Basque language had been lost centuries ago. Basque also enjoys some official recognition in Navarra (in Basque, Nafarroa), which is a separate autonomous community within the administrative structure of Spain. Although the greatest part of Navarra was Basque-speaking just a few centuries ago, the language suffered a strong geographical recession in the 19th and 20th centuries, and nowadays it is spoken natively only in the northwestern area of this region. The French Basque country comprises approximately the western half of the Départment des Pyrenées Atlantiques. In most of the Basque-speaking area of France, the transmission of the language has seriously declined in the last few decades. Only a small percentage of children are currently learning Basque in this area.

From toponyms and other sources, we know that historically the Basque language was spoken over a larger area. The word *Basque* derives from Vascones, a nation that in Roman times occupied most of Navarra and northern Aragon. Across the Pyrenees, there is abundant epigraphic evidence showing that Basque or a very similar language was also spoken in the territory of the Aquitani. The Aquitanian inscriptions on tombstones, in Latin, provide only evidence for proper names, but they contain such clear elements as ANDERE (cf., Basque *andere* 'woman') and CISSON (cf., Basque *gizon* 'man') as proper names for individuals of the respective sex. For the late Middle Ages, we have documentary evidence that Basque was spoken both in northern Aragon and in areas of La Rioja and northern Castile, to the west

Basque (Euskara) is the only remaining vestige of the linguistic situation in western and central Europe before the Indo-European expansion. Although many attempts have been made to relate Basque to other languages of the world, none of them is generally considered to have been successful. Genetic links with the Finno-Ugric family, the languages of the Caucasus, or any other living language for which some scholars have sought a genetic relationship with Basque would be so remote that no solid proof is likely to emerge.

As for the extinct language of the ancient Iberians, once spoken along the Mediterranean coast of Spain and known to us from a relatively large number of inscriptions, the fact that Basque has been of little help in deciphering these inscriptions forces us to discard the hypothesis that the two languages are closely related (although they do share a number of phonological and morphological features, attributable to areal phenomena). Basque is thus a language isolate.

Throughout its known history, Basque has been spoken in an area of variable extent on both sides of the western Pyrenees and along the coast of the Bay of Biscay. The present-day Basque-speaking area (*Euskal Herria*) corresponds to parts of three different administrative units, two in Spain and one in France. There are currently approximately 700 000 speakers of Basque, almost all fully bilingual in either Spanish or French. The largest number of speakers is found in the Autonomous Community of the Basque Country (ACBC), which comprises the provinces of Bizkaia, Gipuzkoa, and Araba (in Basque)/Alava (in Spanish). Here Basque is co-official with Spanish and has an important presence in the educational system. In this region, the number of Basque speakers is growing in areas where the language is natively spoken by part of the population as well as in other areas, such as the city of Bilbao and most of Araba/Alava, where the Basque language had been lost centuries ago. Basque also enjoys some official recognition in Navarra (in Basque, Nafarroa), which is a separate autonomous community within the administrative structure of Spain. Although the greatest part of Navarra was Basque-speaking just a few centuries ago, the language suffered a strong geographical recession in the 19th and 20th centuries, and nowadays it is spoken natively only in the northwestern area of this region. The French Basque country comprises approximately the western half of the Départment des Pyrenées Atlantiques. In most of the Basque-speaking area of France, the transmission of the language has seriously declined in the last few decades. Only a small percentage of children are currently learning Basque in this area.

From toponyms and other sources, we know that historically the Basque language was spoken over a larger area. The word *Basque* derives from Vascones, a nation that in Roman times occupied most of Navarra and northern Aragon. Across the Pyrenees, there is abundant epigraphic evidence showing that Basque or a very similar language was also spoken in the territory of the Aquitani. The Aquitanian inscriptions on tombstones, in Latin, provide only evidence for proper names, but they contain such clear elements as ANDERE (cf., Basque *andere* 'woman') and CISSON (cf., Basque *gizon* 'man') as proper names for individuals of the respective sex. For the late Middle Ages, we have documentary evidence that Basque was spoken both in northern Aragon and in areas of La Rioja and northern Castile, to the west

and south of the present-day Basque country. It is, however, likely that the historical presence of the Basque language in these latter areas, and perhaps even in part of the territory of the ACBC, is due to territorial expansion during the early Middle Ages.

One reason for the hypothesis that Basque may have occupied a compact area at some point after the fall of the Roman Empire is that dialectal diversity within Basque is relatively small and clearly not ancient. Many obvious innovations are shared by all dialects. In some aspects, such as the accentual system and the morphology of finite verb forms, variation is, nevertheless, considerable (even if it is due to relatively recent diversification) and in fact virtually every valley or town has a recognizable local variety. *Euskara batua* (unified Basque), the standard promoted by the Basque Academy, which is based on the literary tradition of central areas both to the north and the south of the Pyrenees, has been enormously successful in its social implantation through its use in the educational system and in the media.

Most Basque dialects have five vowel phonemes /i e a o u/. Zuberoan (Souletin) and a few other varieties spoken in France have a sixth oral vowel /y/ as well as contrastively nasalized vowels. A common consonantal inventory, such as is found in Gipuzkoan, is the following (the most common orthographic representation follows in parentheses when it is different from the phonetic symbol): /p t c (*tt*) k b d ɟ (*dd*) g t̪s̪ (*tz*) t̪s̪ (*ts*) tʃ (*tx*) s̪ (*z*) s̪ (*s*) ʃ (*x*) x (*j*) m n ɲ (*ñ*) l ʎ (*ll*) ɾ (*r*) r (*rr*)/. The most unusual aspect of this inventory is presented by the contrast between the two fricatives, lamino-alveolar *z* /s̪/ (*izan* 'be') and apico-alveolar *s* /s̪/ (*esan* 'say'), and the two corresponding affricated segments (*atzo* 'yesterday,' *atso* 'old woman'). All Bizkaian and some Gipuzkoan varieties have lost this contrast. The phoneme /x/ is found only in the speech of speakers from Spain. Besides being found in borrowings from Spanish, in central areas (Gipuzkoa and some neighboring regions) it also appears in native words as a result of an evolution /j > ʒ > ʃ > x/ (like in Castilian Spanish). Other dialects have stopped at various stages along this evolutionary path. The result is that orthographic *j* in native words such as *jan* 'eat' is subject to much variation in its pronunciation. Whereas the official standard pronunciation is /jan/, the Gipuzkoan form /xan/ is also in widespread usage in standard Basque, and locally forms like /ʒan/ and /ʃan/ are also used. Conversely, a phoneme /h/ (orthographic *h*: *hemen* 'here,' *aho* 'mouth') is used only in parts of the French Basque country. That is, for most speakers orthographic *h* is silent. The (pre)palatal consonants have a special status. One way to form diminutive/affective forms is by palatalization, for example, *tanta* 'drop,' *ttantta* /canca/ 'small drop,' *zezen* 'bull,' *xexen* /ʃeʃen/ 'little bull.' A pitch-accent system strikingly similar to that of Tokyo Japanese, with a lexical contrast between accented and unaccented words, is found in the northern Bizkaian area. The most common accentual system (in Gizpuzkoan and neighboring areas), however, has regular stress on the second syllable.

Marking of grammatical functions works on a strictly ergative basis, with one case (absolutive, morphologically unmarked) assigned to objects and intransitive subjects and another (ergative, *-k*) assigned to transitive subjects: *lagunak liburua dakar* 'the friend is bringing the book,' *laguna dator* 'the friend is coming.' Nevertheless, a class of syntactically intransitive verbs takes ergative subjects (and transitive auxiliaries and agreement) in a somewhat unpredictable manner: *lagunak dantzatu du* 'the friend has danced.' Finite verb forms are marked for agreement with up to three arguments (subject, object, and indirect object): *dakarzkiguzu* 'you (*-zu*) are bringing them (*-z-*) to us (*-gu*)' (*-kar-* is the verb root 'bring'; *-ki-* is a dative pre-prefix). In addition, in the familiar treatment, an addressee who is not an argument of the verb is also obligatorily encoded in the morphology of verbs in main clauses. Thus, for instance, plain/formal *dakit* 'I know it' is replaced, in the familiar treatment, by *zekiat* 'I know it (male addressee)' or *zekinat* 'I know it (female addressee).'

Although both SOV and SVO orders are common in texts, verb-final structures are more basic: *gizona da* 'it is the man.' Focalized elements and question words are normally immediately preverbal. Main verbs precede auxiliaries (*etorri da* '(she/he) has come'), except in negative clauses (*ez da etorri* '(she/he) has not come').

Articles and demonstratives are phrase-final: *laguna* 'the friend,' *lagun bat* 'a/one friend,' *lagun hori* 'that friend,' *lagun gazte hori* 'that young friend.' Although, as shown in the last example, adjectives follow nouns, genitives and relative clauses precede the head noun, as in most other SOV languages (*lagunaren liburua* 'the friend's book,' *etorri den laguna* 'the friend who has come'). Noun phrases are inflected for number and case by suffixes attached to the last word in the phrase: *lagunari* 'to the friend,' *lagun onari* 'to the good friend,' *etorri den lagun gaztearentzat* 'for the young friend who has come.'

Batchelor, John (1853–1944)

A Pérez Pereiro, Arizona State University, Tempe, AZ, USA

© 2006 Elsevier Ltd. All rights reserved.

One of the most respected of Ainu scholars, John Batchelor is widely credited with popularizing the study of Ainu language and culture in the West. Born in Uckfield, Sussex, on March 20, 1854, Batchelor became a gardener at the Uckfield Parish Church at the age of 12. At the age of 19, inspired by a sermon, he decided to become a missionary and asked to be considered for the mission in Hong Kong. Successful, he arrived in Hong Kong in 1875, but soon began suffering from respiratory ailments as well as malaria. In 1877, on the advice of his doctor, he moved to Hokkaido in northern Japan where the cooler climate would provide relief.

In Hokkaido, Batchelor encountered the indigenous Ainu people and, moved by their plight, asked permission to mission to them. He would spend the next 60 years living among the Ainu, learning the language and compiling records of their traditional culture and folklore. Along with translations of the New Testament and collections of folktales, Batchelor published his *Ainu–English–Japanese dictionary* in 1889 (4th edn. in 1938) – considered his most important work. These works, written in Roman characters, made Ainu studies accessible to scholars not versed in Japanese and are still regarded as important reference works today.

Despite this fact, Batchelor's work has drawn heavy criticism, particularly from Japanese scholars such as Mashiho Chiri. Although Batchelor's Ainu language skills were recognized by the Ainu themselves, his training as a missionary rather than as a linguist meant that his transcriptions of the language as well as the grammar accompanying his dictionary left something to be desired. Among the principle criticisms were that his transcription system was

Batchelor, John (1853–1944)

A Pérez Pereiro, Arizona State University, Tempe, AZ, USA

© 2006 Elsevier Ltd. All rights reserved.

One of the most respected of Ainu scholars, John Batchelor is widely credited with popularizing the study of Ainu language and culture in the West. Born in Uckfield, Sussex, on March 20, 1854, Batchelor became a gardener at the Uckfield Parish Church at the age of 12. At the age of 19, inspired by a sermon, he decided to become a missionary and asked to be considered for the mission in Hong Kong. Successful, he arrived in Hong Kong in 1875, but soon began suffering from respiratory ailments as well as malaria. In 1877, on the advice of his doctor, he moved to Hokkaido in northern Japan where the cooler climate would provide relief.

In Hokkaido, Batchelor encountered the indigenous Ainu people and, moved by their plight, asked permission to mission to them. He would spend the next 60 years living among the Ainu, learning the language and compiling records of their traditional culture and folklore. Along with translations of the New Testament and collections of folktales, Batchelor published his *Ainu–English–Japanese dictionary* in 1889 (4th edn. in 1938) – considered his most important work. These works, written in Roman characters, made Ainu studies accessible to scholars not versed in Japanese and are still regarded as important reference works today.

Despite this fact, Batchelor's work has drawn heavy criticism, particularly from Japanese scholars such as Mashiho Chiri. Although Batchelor's Ainu language skills were recognized by the Ainu themselves, his training as a missionary rather than as a linguist meant that his transcriptions of the language as well as the grammar accompanying his dictionary left something to be desired. Among the principle criticisms were that his transcription system was

amateurish and that he forced the Ainu language into the grammatical categories of Latin.

Batchelor also weighed in on the question of the origins of the Ainu and their language, which he considered to be an Indo-European tongue, completely distinct from Japanese. According to Batchelor, there are significant correlations in key vocabulary items between Ainu and Indo-European languages, as well as grammatical characteristics in Ainu normally associated with these languages. While Batchelor did provide a list of words he believed supported his hypothesis, he never truly explained what evidence he found in the grammar.

Batchelor was also recognized for his advocacy of Ainu causes, and while he held attitudes that would be considered patronizing today, he was obviously concerned with anti-Ainu racism among the Japanese and its social consequences. In 1909, Batchelor was awarded the Fourth Order of the Sacred Treasure (zuihosho) by the Japanese emperor for his work, both social and scholarly, among the Ainu, and he would receive the Third Order in 1933. He also attracted the attention and patronage of many prominent Japanese, including Marquis Yoshichika Tokugawa and Prince Takamatsu, the emperor's brother, who funded some of Batchelor's work in 1932.

In 1940, with anti-Western feeling mounting, Batchelor decided to return to Britain, where he died four years later in 1944. Today, the Ainu Museum of Hokkaido University is dedicated to the life and work of John Batchelor.

Bateson, Gregory (1904–1980)

A Sunshine, Columbia University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Gregory Bateson made important contributions to several disciplines, particularly anthropology, psychiatry, and ethology. Although Bateson was not a linguist, his studies of communication, learning, play, and fantasy have been a major influence on sociolinguists, anthropological linguists, and other students of discourse, conversational interaction, and pragmatics. Salient among the concepts developed in his work are the frame, logical types, metacommunication, and the double bind.

Bateson was born on May 9, 1904 in Cambridge, England. He was the youngest of his parents' three children, all sons. His father, William Bateson, was a founder of the modern science of genetics. Bateson attended St John's College, Cambridge, where he earned his bachelor's degree in natural sciences (1925) and his master's in anthropology (1930), having completed fieldwork in New Britain and New Guinea.

In 1932, Bateson and the American anthropologist Margaret Mead met in New Guinea. They were married in 1936 and had one child, Mary Catherine Bateson, a well-regarded scholar in her own right, but they divorced in 1950. Bateson married Lois Cammack in 1961 and they had three children.

Bateson's first major publication was *Naven* (1936), an ethnography based on his work among the Iatmul. His subsequent field work with Mead in Bali yielded *Balinese character* (1942). During World War II, Bateson served in Asia in the Office of Strategic Services.

In the early 1940s, Bateson became involved with Norbert Wiener, Warren McCulloch, Claude Shannon, John von Neumann, and other engineers and mathematicians, who began meeting periodically to elaborate a theory of communication and control in animals and machines dubbed 'cybernetics' by Wiener. Late in life, Bateson would characterize his "membership in those conferences [as] one of the great events of my life" (Lipset, 1982: 180). This developing theory led Bateson to recast his thinking about social organization, and seems to have inspired those of his ideas that have most intrigued linguists.

Most of Bateson's employment was in hospitals and labs for the study of animal behavior. In 1948, he assumed a two-year appointment at University of

amateurish and that he forced the Ainu language into the grammatical categories of Latin.

In the early 1940s, Bateson became involved with Norbert Wiener, Warren McCulloch, Claude Shannon, John von Neumann, and other engineers and mathematicians, who began meeting periodically to elaborate a theory of communication and control in animals and machines dubbed 'cybernetics' by Wiener. Late in life, Bateson would characterize his "membership in those conferences [as] one of the great events of my life" (Lipset, 1982: 180). This developing theory led Bateson to recast his thinking about social organization, and seems to have inspired those of his ideas that have most intrigued linguists.

Most of Bateson's employment was in hospitals and labs for the study of animal behavior. In 1948, he assumed a two-year appointment at University of

California Medical School, where he became involved with Juergen Ruesch, M.D. in the study of communication in the context of psychotherapy. They co-authored *Communication: the social matrix of psychiatry* (1951).

In subsequent work in the 1950s on schizophrenia, Bateson, in conjunction with Jackson, Haley, Weakland, and Fry, focused on interaction and the utterances that form part of the interaction. This research group developed the theory of the 'double bind,' a type of communication in which, characteristically, a parent verbally enjoins a child to do one thing, with the request embedded in a nonverbalized metacommunication saying that if the child obeys the verbal command, he or she will be punished. The group hypothesized that this is the matrix from which schizophrenics are born, although they did not discount the biochemical dimension of the illness. Further, the cryptic qualities of schizophrenic discourse, which distort or omit signals about relationships, reflect the schizophrenic's efforts to cope with the double bind. In these studies and elsewhere, Bateson sought to show that pathology of communication derives from confusion or paradoxes of logical typing, in which, e.g., a signifier may be confused with its signified. Such confusion, however, is also the germ of verbal creativity. Much of the suggestiveness of Bateson's thinking lies in the affinities he finds between pathological communication and verbal creativity.

Bats: Communication by Ultrasound

B M Siemers, Tübingen University, Tübingen, Germany

© 2006 Elsevier Ltd. All rights reserved.

Biology and Systematics of Bats

Bats are the only mammals capable of active flight. Classically, zoologists subdivide bats (mammalian order Chiroptera) into microbats (Microchiroptera, 930 species) and megabats (Megachiroptera, 186 species; Simmons, in press). Work by molecular phylogeneticists suggests that most species of the (classically microbat) superfamily Rhinolophoidea are more closely related to the megabats than to microbats (Teeling *et al*., 2002). Both Rhinolophoidea and the remaining microbats are capable of sophisticated echolocation using tonal, larynx-produced sounds (see Echolocation and Why Ultrasound?, below), whereas megabats are not. The new phylogenetic tree therefore implies an evolutionary scenario where either laryngeal echolocation evolved twice independently or the megabat ancestor was capable of laryngeal echolocation and lost this capability in the course of further evolution.

Megabats occur in the Old World tropics and feed on fruit, leaves, pollen, and nectar. They play an important role in the ecology of tropical forests as seed dispersers and pollinators. Sensitive, large eyes and a keen sense of smell guide them on their nocturnal foraging trips. Most megabats roost in trees where there is light for visual orientation and do not use acoustic signals for echolocation. But as most species live in groups and are highly social, acoustic signals play an important role in communication (Fenton, 1985; Van Parijs and Corkeron, 2002). A simple echolocation system evolved in the cave-dwelling megabat genus *Rousettus*. Here, echolocation signals are short, broadband, and rather stereotyped tongue click signals. Echolocation in *Rousettus* therefore is very likely to have evolved independently of microchiropteran echolocation, which is based on laryngeal vocalizations produced by vibrations of the vocal cords.

Microbats live on all five continents and occupy a wealth of ecological niches. Some are fast fliers that hunt insects in the open skies; others are maneuverable, hovering species that pollinate flowers or eat fruit in Neotropical rainforests. Though most species

Bats: Communication by Ultrasound

B M Siemers, Tübingen University, Tübingen, Germany

© 2006 Elsevier Ltd. All rights reserved.

Biology and Systematics of Bats

Bats are the only mammals capable of active flight. Classically, zoologists subdivide bats (mammalian order Chiroptera) into microbats (Microchiroptera, 930 species) and megabats (Megachiroptera, 186 species; Simmons, in press). Work by molecular phylogeneticists suggests that most species of the (classically microbat) superfamily Rhinolophoidea are more closely related to the megabats than to microbats (Teeling *et al*., 2002). Both Rhinolophoidea and the remaining microbats are capable of sophisticated echolocation using tonal, larynx-produced sounds (see Echolocation and Why Ultrasound?, below), whereas megabats are not. The new phylogenetic tree therefore implies an evolutionary scenario where either laryngeal echolocation evolved twice independently or the megabat ancestor was capable of laryngeal echolocation and lost this capability in the course of further evolution.

Megabats occur in the Old World tropics and feed on fruit, leaves, pollen, and nectar. They play an important role in the ecology of tropical forests as seed dispersers and pollinators. Sensitive, large eyes and a keen sense of smell guide them on their nocturnal foraging trips. Most megabats roost in trees where there is light for visual orientation and do not use acoustic signals for echolocation. But as most species live in groups and are highly social, acoustic signals play an important role in communication (Fenton, 1985; Van Parijs and Corkeron, 2002). A simple echolocation system evolved in the cave-dwelling megabat genus *Rousettus*. Here, echolocation signals are short, broadband, and rather stereotyped tongue click signals. Echolocation in *Rousettus* therefore is very likely to have evolved independently of microchiropteran echolocation, which is based on laryngeal vocalizations produced by vibrations of the vocal cords.

Microbats live on all five continents and occupy a wealth of ecological niches. Some are fast fliers that hunt insects in the open skies; others are maneuverable, hovering species that pollinate flowers or eat fruit in Neotropical rainforests. Though most species

are insectivorous, others are carnivorous, preying on small mammals, birds, reptiles, amphibians, or fish. Three species of vampire bats eat blood from birds or mammals. The different ecologies of the bat species are reflected in their social systems, in their needs for social communication (Bradbury, 1977), and in the structure of their echolocation calls (Fenton, 1990; Schnitzler *et al.*, 2003).

Echolocation and Why Ultrasound?

Echolocation obviously depends on sound, but not necessarily on ultrasonic sound. The key function of echolocation calls is to generate echoes that permit a bat to negotiate its three-dimensional environment and, for aerial-hawking bats, to detect, evaluate, and track flying insect prey (Schnitzler *et al.*, 2003). Echolocation is sometimes referred to as 'autocommunication' (Bradbury and Vehrencamp, 1998). Echolocation signals of microbats are tonal signals; i.e., they are produced by the larynx (source: phonation) and filtered by the vocal tract (filter: articulation) just like mammalian vocal signals in general. Some species emit their signals through open mouths, others through the nostrils. Echolocation signals can consist of different elements: some that are pure in tone (constant frequency) and others that are frequency modulated (Figure 1). They often have more or less prominent harmonics (overtones). Echolocation signals surely evolved from communication signals and this origin can also be seen in their ontogeny. Young bats steadily increase the frequency and shorten the duration of a certain call type and thereby transform it into the nearly adult echolocation signal that they are able to produce when they become volant at approximately 4 to 8 weeks of age (Brown and Grinnell, 1980).

Laryngeal production of echolocation calls enables bats to produce a continuum of call types that constitute the species-specific signal repertoire. Calls can be varied from short (<1 ms) to long (>10 ms; in some horseshoe bats, genus *Rhinolophus*, up to 300 ms) and repetition rate varies from <5/s to 200/s during prey capture (Figures 1 and 2). The frequencies contained in the call and the call bandwidth can be changed, but the frequency range and often the frequency with most energy are species specific (e.g., Siemers *et al.*, 2001; Siemers and Schnitzler, 2004). These can range from approximately 10 kHz to over 200 kHz, although most species broadcast in the frequency band from 20 to 80 kHz. Humans cannot hear above 20 kHz and therefore we call sounds above 20 kHz 'ultrasonic.' It is important to note that humans and some other large mammals are specialized low-frequency hearers (human hearing range: 16 Hz to 20 kHz), whereas most small mammals have high hearing sensitivity up to at least 40 or 60 kHz. Accordingly, several groups of small mammals, e.g., rodents, shrews, primates, and bats, use communication signals that include ultrasonic elements. That is the first part of the explanation why bats use mostly ultrasound for echolocation: it is perfectly normal sound to them. Additionally, several arthropods that bats feed on and owls cannot hear ultrasound and therefore ultrasound echolocation has the evolutionary advantage of not warning off prey or attracting avian predators. A main reason for ultrasonic echolocation is that sound wavelength is inversely proportional to frequency: the separability of two objects by echolocation (resolution) and the detectability of

Figure 1 Individual bats are able to adapt the signal structure to the echolocation task they are currently facing. Spectrograms of four calls exemplify the range of the signal repertoires for (A) the Neotropical black myotis (*Myotis nigricans*) and (B) the Mediterranean horseshoe bat (*Rhinolophus euryale*).

small objects increase with decreasing wavelength (but it is important to note that bats can easily detect objects, e.g., thin wires, much smaller than their call wavelength). High frequencies therefore increase the detail in a bat's echo image, but they come at the price of higher absorption loss (atmospheric attenuation). Aerial-hawking bats emit very intense echolocation calls (source levels often >120 dB SPL; Holderied and von Helversen, 2003), but bats usually react to insect targets only when they are as close as 1 to 5 m. Echoes of extended background structures such as the ground or a cliff with very good reflection properties might be perceivable from a maximum of 90 m (Holderied and von Helversen, 2003), but compared to (human) vision, echolocation is clearly not a far-range orientation system. Bats are not blind and complement echolocation by vision in certain situations (Eklöf, 2003).

The Communicative Function of Echolocation Calls

Echolocation involves information leakage because the signals (and perhaps some echoes) are available to any animal that can hear them; i.e., echolocation inevitably has a communicative function. Bats eavesdrop on other bats (Barclay, 1982; Fenton, 2003) and often can determine from the echolocation calls alone whether the other bat is a conspecific or not, with obvious implications for agonistic or mutualistic interactions. A few bat species have been found to show sexual dimorphism or age differences (mainly first-year bats versus older bats) in echolocation signals (e.g., Neuweiler *et al.*, 1987; Russo *et al.*, 2001); i.e., they communicate information about their sex or age group as a byproduct of echolocation (Kazial and Masters, 2004).

Given the long life span (records from the wild >20 years) and the high sociality of bats, we can expect reciprocal interactions and cooperation (e.g., Kerth and Reckardt, 2003), which will depend on individual recognition between colony members. Some data show individual-specific signatures in echolocation calls (Obrist, 1995; Burnett *et al.*, 2001; Fenton, 2003; Fenton *et al.*, 2004), but it is not yet clear whether the bats can make use of them and whether the variability is large enough to reliably code the many individuals of large colonies. We have little evidence for a clear correlation between call parameters and size or body condition within sexes. The data available to date do not suggest that echolocation calls would generally be reliable, quality-related (i.e., honest) signals for the assessment of potential mates or competitors.

Individual bats adapt their signal structure to the echolocation task they are currently facing (Fenton, 1990; Schnitzler *et al.*, 2003). A bat searching for insects high up in the open sky broadcasts long signals with all energy concentrated in a narrow frequency band (i.e., low call bandwidth) to increase detection probability. After detecting prey, it gradually switches to shorter, more broadband signals (Figure 2). Their echoes deliver short, precise time markers to the bat's hearing system and thereby increase localization and ranging accuracy, needed to intercept the insect in three-dimensional space. Prior to capture, the bat

Figure 2 Spectrogram representation of echolocation sequence of a Schreiber's bat (*Miniopterus schreibersii*) broadcast during prey capture. The long, narrowband search calls gradually change into shorter, more broadband approach calls after prey detection. Prior to capture, the bat produces the 'buzz' with the highest signal repetition rates and lowest terminal frequencies. After a pause, it resumes echolocation.

increases repetition rate to track evasive maneuvers of the prey and many species emit a so-called 'buzz': a terminal group with a signal repetition rate of up to 200 Hz. When the same bat forages along a hedgerow or flies within a forest, it is permanently faced with localization tasks to avoid collision and therefore uses short, broadband calls (Siemers *et al.*, 2001). Signal structure thus is varied greatly in response to the current task and individual- or sex-specific call signatures must be very robust not to be masked by the task-specific variability. However, the task specificity of echolocation calls indicates that bats automatically communicate information about their current behavior to homo- or heterospecific eavesdroppers (Barclay, 1982; Fenton, 2003). A high rate of approach sequences and buzzes will signal intense prey capture behavior; i.e., high prey density, to competing or potentially cooperating individuals. There is even evidence that the pause and the calls after the buzz disclose whether the attack was successful (Britton and Jones, 1999; Surlykke *et al.*, 2003).

Social Calls in Bats

Bats use a variety of vocal signals for purely communicative purposes (Figure 3). The acoustic structure of social calls is not constrained by the need to deliver useful echoes for orientation. As a consequence, social calls are often longer and lower in frequency than echolocation signals and therefore can be heard over greater distances. Social calls of many bat species extend into the human hearing range but usually include ultrasonic components. As for echolocation calls, higher frequency decreases the range of effectiveness (because of stronger attenuation of high-frequency sound), but simultaneously decreases the likelihood of divulging the caller's presence to a predator. Most types of social calls are tonal frequency-modulated or constant-frequency signals, often containing strong harmonics; noise bursts sometimes occur, mostly in antagonistic interactions (e.g., Kanwal *et al.*, 1994; Pfalzer and Kusch, 2003). The structure of social calls is by far more complex than that of echolocation calls, including sinusoidal frequency modulation and signals that are composed of several different syllables or elements (Figure 3). This complexity offers the possibility of encoding individual- or situation-specific information in details of time and frequency parameters. We have a fair overview of the acoustic structure of bat social calls, but only relatively few studies addressed the communicative function of these calls in detail. For a rather limited number of bat species, vocal communication has been investigated in the context of mother–infant interaction, mating, agonistic encounters, group recognition, and distress. Each is dealt with briefly in the following paragraph.

Some bats recognize individuals or group members by their social calls. This is especially impressive in the

Figure 3 Examples of bat social calls in spectrogram representation: (A) Social calls used by a Nathusius' pipistrelle (*Pipistrellus nathusii*) for courtship and presumably also for defense of transient small hunting territories. Recording by A. M. Boonman, Tübingen University. (B) Sinusoidal directive call of a female lesser spear-nosed bat (*Phyllostomus discolor*) used in mother–infant communication. Recording by K.-H. Esser, Institute of Zoology, School of Veterinary Medicine, Hannover. (C) Isolation calls of a young parti-colored bat (*Vespertilo murinus*). Recording by I. Kaipf, Tübingen University. (D) Distress calls by a handheld parti-colored bat (*V. murinus*). Recording by A. Schaub, Tübingen University.

case of mother–infant recognition, where mothers find their calling pups among thousands of other infants (although spatial memory and olfactory cues also play a role). The young are attracted to the 'directive calls' of the mothers (Figure 3B) but they cannot always recognize their mother (Balcombe and McCracken, 1992). Mothers discriminate the pups by their 'isolation calls' (Figure 3C; Balcombe, 1990). Isolation calls can have heritable signatures (Scherrer and Wilkinson, 1993) and/or be matched to the mother's individual call structure through vocal learning (Esser and Schmidt, 1989). In the mating season (in autumn in temperate regions), male bats use courtship or advertisement calls (Fenton, 1985; Pfalzer and Kusch, 2003). Some species call from mating roosts in trees or caves, whereas others attract females with song flights (Figure 3A). Foraging bats of some species, e.g., pipistrelle bats, utter short sequences of social calls from time to time, especially when chasing off conspecifics. Interestingly, in pipistrelles they are similar to advertisement calls in acoustic structure. Sound analysis and playback experiments showed that these calls are species specific and that the bats respond differently to homo- or heterospecific calls (Barlow and Jones, 1997a; 1997b). They presumably serve to mark transient and very small hunting territories. In contrast, the Neotropical greater spear-nosed bat (*Phyllostomus hastatus*) forms stable groups of unrelated females that benefit from group foraging. They use group-distinctive social calls that are acquired by vocal learning to coordinate their joint trips and to discriminate group mates from strangers (Boughman, 1998; Boughman and Wilkinson, 1998; Wilkinson and Boughman, 1998). Distress calls (Figure 3D) attract bats from their own and from other species, possibly to irritate and deter a potential predator that is threatening the calling bat (Russ *et al*., 2004).

Whereas many types of social calls are complex enough to code individual-specific information, it is not yet clear whether some calls are honest signals in that they would contain quality-related information about the potential mate or competitor. Furthermore, there is very limited information about the function of the non-mother–infant social calls that can readily be recorded at bat colonies. It is technically difficult to identify the signal sender and the receivers plus their behavioral responses in bat roosts with dozens to thousands of densely packed individuals, but this surely represents a major challenge for future bat sociobiology research. Owing to methodological advances in sound recording, marking, and recognition of individuals, paternity assignment, and field observation techniques, the study of bat vocal communication will surely make significant progress in the years to come and answer many of the fascinating questions that are as yet still open.

This article is reproduced from the previous edition, volume 1, p. 318, © 1994, Elsevier Ltd.

Baudouin de Courtenay is best known for his view of language sounds as structural entities rather than as mere physical phenomena, a view which anticipated the modern linguistic concern with linguistic structure.

He was born on March 13, 1845 in Radzymin near Warsaw. His family was of French extraction with a long line of aristocratic ancestors including Baldwin de Courtenay, Count of Flanders, who was Lord of Constantinople in the fourteenth century. Baudouin's great-great-grandfather migrated to Poland and the French branch of the family died out

at the beginning of the 18th century leaving only the Polish side.

Baudouin studied Slavic linguistics at the University of Warsaw, taking a great interest in the psychological interpretation of language facts, a trend growing in Western European linguistics at that time. After obtaining his master's degree in 1866 he went to Prague. Jena, and Berlin, where he studied Sanskrit. Afterward he studied in St Petersburg and in Leipzig, receiving a master's degree in historical linguistics. In 1872, Baudouin went to Italy to study the Slavic dialects of Rezija for which he was awarded a doctorate in comparative grammar by the University of St Petersburg. From 1875–83, he was at Kazan for eight years, where he worked closely with Kruszewski (*see* **Kruszewski, Mikolaj Habdank (1851–1887)**) before becoming professor of Comparative Slavonic at Dorpat (Tartu). In 1893, he became professor of Slavic Linguistics at Krakow and in 1900 moved back to St Petersburg, where he was imprisoned in 1913 for writings against the state. Released at the beginning of World War I, he returned to Poland after the war, to the newly reestablished University of Warsaw, where he died on November 3, 1929.

Although Baudouin specialized in comparative linguistics, he also addressed general problems, including questions of language mixture, children's speech, and the effect of linguistic structure on world outlook. However, Baudouin's principal contribution to modern linguistics was the elaboration of a theory of phonology and morphophonemics which served as a departure point for all further research in these two areas.

Baudouin considered linguistics to be a science which deals with nature and man at the same time. For Baudouin, there were two sciences: a natural science, phonetics (or 'anthropophonics,' to use his term), and a humanistic science, psychophonetics. The two sciences overlap in their scope, but the second studies only that which exists in the form of articulatory–auditory representations. Baudouin considered terms like 'sound' and 'resonance' to belong to natural science and devised new terms to represent linguistic thought based on individual and individual–collective mental processes. He introduced the term 'phoneme' as the psychological equivalent of 'sound,' and 'kineme' and 'acousmeme' for the psychological elements of articulation and audition respectively.

Most of Baudouin's writings are in Polish or Russian (some are in German), and this kept many Western linguists largely ignorant of his contribution to the field for quite some time. Translations of his work are available, however, the main one being Stankiewicz's *Anthology*, which also gives further details of Baudouin's life and career.

Bayle, Pierre (1647–1706)

V Raby, Université de Reims-Champagne-Ardenne, Reims, France

© 2006 Elsevier Ltd. All rights reserved.

Pierre Bayle was born in 1647 in Carla, comté de Foix. He died in 1706 in Rotterdam. Son of a pastor, Bayle was first educated by the Protestants in Puylaurens, then by the Jesuits in Toulouse. He converted to Catholicism for two years in 1668, but his return to Protestantism forced him into voluntary exile for four years in Geneva. There he studied theology and discovered the Cartesian doctrine. He came back to France in 1674 and was appointed teacher of philosophy at the *Académie réformée* of Sedan. When the Académie was shut down in 1681, Bayle left France to teach philosophy and history in Rotterdam until 1693.

His famous *Dictionnaire historique et critique* (1697) was originally conceived as a critical response to Louis Moréri's *Grand dictionnaire historique* (1674), but it goes well beyond this goal. The four volumes (almost 4000 pages) of detailed and intricate bio-bibliographical articles, critical commentaries,

at the beginning of the 18th century leaving only the Polish side.

Baudouin studied Slavic linguistics at the University of Warsaw, taking a great interest in the psychological interpretation of language facts, a trend growing in Western European linguistics at that time. After obtaining his master's degree in 1866 he went to Prague. Jena, and Berlin, where he studied Sanskrit. The two sciences overlap in their scope, but the second studies only that which exists in the form of articulatory–auditory representations. Baudouin considered terms like 'sound' and 'resonance' to belong to natural science and devised new terms to represent linguistic thought based on individual and individual–collective mental processes. He introduced the term 'phoneme' as the psychological equivalent of 'sound,' and 'kineme' and 'acousmeme' for the psychological elements of articulation and audition respectively.

Most of Baudouin's writings are in Polish or Russian (some are in German), and this kept many Western linguists largely ignorant of his contribution to the field for quite some time. Translations of his work are available, however, the main one being Stankiewicz's *Anthology*, which also gives further details of Baudouin's life and career.

Bayle, Pierre (1647–1706)

V Raby, Université de Reims-Champagne-Ardenne, Reims, France

© 2006 Elsevier Ltd. All rights reserved.

Pierre Bayle was born in 1647 in Carla, comté de Foix. He died in 1706 in Rotterdam. Son of a pastor, Bayle was first educated by the Protestants in Puylaurens, then by the Jesuits in Toulouse. He converted to Catholicism for two years in 1668, but his return to Protestantism forced him into voluntary exile for four years in Geneva. There he studied theology and discovered the Cartesian doctrine. He came back to France in 1674 and was appointed teacher of philosophy at the *Académie réformée* of Sedan. When the Académie was shut down in 1681, Bayle left France to teach philosophy and history in Rotterdam until 1693.

His famous *Dictionnaire historique et critique* (1697) was originally conceived as a critical response to Louis Moréri's *Grand dictionnaire historique* (1674), but it goes well beyond this goal. The four volumes (almost 4000 pages) of detailed and intricate bio-bibliographical articles, critical commentaries,

footnotes, and marginal notes make this oeuvre an unrivalled monument of erudite critical methodology. Bayle tried to faithfully represent the various philosophical doctrines while criticizing them as intelligently as possible. Although forbidden in France, the *Dictionnaire* had eight French editions in 50 years and was translated into English and German (German, Standard). This work appears to be a continuation of the previous books of Bayle, which attacked the Roman Church in various ways and argued for religious tolerance.

Although no direct contribution to linguistics can be found in Bayle's *Dictionary*, his controversial method was an influential model for Diderot's *Encyclopedia*. In addition, this work constitutes one of the earliest histories of Occidental philosophy and served for a long time as a medium for reading the philosophical doctrines of the Antiquity and Renaissance eras.

Beattie, James (1735–1803)

J E Joseph, University of Edinburgh, Edinburgh, UK

© 2006 Elsevier Ltd. All rights reserved.

James Beattie was born in 1735 in Laurencekirk, a village on the east coast of Scotland between Dundee and Aberdeen. From 1749 to 1753 he studied at Marischal College in Aberdeen, where he was appointed Professor of Moral Philosophy and Logic in 1760, having spent the intervening years as a schoolteacher and poet. He published his first poems in 1756, and through the 1760s continued to write both poetry and philosophy. He achieved fame almost simultaneously in both areas, when his *Essay on the nature of immutability of truth, in opposition to sophistry and scepticism* appeared to widespread acclaim in 1770, followed in 1771 by the first canto of his most popular poetical work, *The minstrel; or, the progress of genius*, which marked him as a key early figure in British Romanticism. The *Essay on truth* was aimed particularly at Hume, and it is believed that Beattie was encouraged to compose and publish it by Reid, whose own complex relationship with Hume made it difficult for either to attack the other directly.

It has been suggested that Reid may also have prompted Beattie to write his 'Dissertation on the theory of language,' which appeared as part of Beattie's *Dissertations moral and critical* in 1783, then was published separately in 1788. Part I, 'Of the origin and general nature of speech,' is distinguished by an especially close attention to phonetic detail, including both articulation and differences of accent. Regarding the origin of language, it takes a resolutely creationist stance, declaring as absurd the 'Epicurean' doctrine according to which human beings could have created and learned language: "If, then, there ever was a time, when all mankind were, as the Epicureans supposed, *mutum et turpe pecus*, a dumb and brutal race of animals, all mankind must, in the ordinary course of things, have continued dumb to this day. – For, first, to such animals speech could not be necessary; as they are supposed to have existed for ages without it: and it is not to be imagined, that dumb and beastly savages would ever think of contriving unnecessary arts, whereof they had no

James Beattie was born in 1735 in Laurencekirk, a village on the east coast of Scotland between Dundee and Aberdeen. From 1749 to 1753 he studied at Marischal College in Aberdeen, where he was appointed Professor of Moral Philosophy and Logic in 1760, having spent the intervening years as a schoolteacher and poet. He published his first poems in 1756, and through the 1760s continued to write both poetry and philosophy. He achieved fame almost simultaneously in both areas, when his *Essay on the nature of immutability of truth, in opposition to sophistry and scepticism* appeared to widespread acclaim in 1770, followed in 1771 by the first canto of his most popular poetical work, *The minstrel; or, the progress of genius*, which marked him as a key early figure in British Romanticism. The *Essay on truth* was aimed particularly at Hume, and it is believed that Beattie was encouraged to compose and publish it by Reid, whose own complex relationship with Hume made it difficult for either to attack the other directly.

It has been suggested that Reid may also have prompted Beattie to write his 'Dissertation on the theory of language,' which appeared as part of Beattie's *Dissertations moral and critical* in 1783, then was published separately in 1788. Part I, 'Of the origin and general nature of speech,' is distinguished by an especially close attention to phonetic detail, including both articulation and differences of accent. Regarding the origin of language, it takes a resolutely creationist stance, declaring as absurd the 'Epicurean' doctrine according to which human beings could have created and learned language: "If, then, there ever was a time, when all mankind were, as the Epicureans supposed, *mutum et turpe pecus*, a dumb and brutal race of animals, all mankind must, in the ordinary course of things, have continued dumb to this day. – For, first, to such animals speech could not be necessary; as they are supposed to have existed for ages without it: and it is not to be imagined, that dumb and beastly savages would ever think of contriving unnecessary arts, whereof they had no

example in the world around them" (Chap. 6). Language must have been received by "our first parents [...] by immediate inspiration"; this "first language, whatever it was, must therefore have been perfect," and had it not been for Babel, "it is probable, that some traces of it would have remained in every language to this day" (ibid.). Yet "the miracle at Babel introduced no material change into human nature," and therefore "it is reasonable to infer, that the *thoughts* of men must in all ages have been nearly the same. [...] Now, as human thoughts discover themselves by language, [...] is it not probable, that there may be in all human languages some general points of resemblance, in structure at least, if not in sound?" (ibid.).

The discovery of these points that all languages have in common is the subject of Part II, 'Of universal grammar,' in which Beattie proceeds systematically through nouns (including pronouns), attributives (adjectives, participles, verbs and their tenses and moods, adverbs), interjections, connectives (prepositions and conjunctions), and articles. His presentation is heavily dependent on Harris's *Hermes; or, a philosophical inquiry concerning language and universal grammar* (1751), though Beattie's work came at a point 30 years later when Scottish linguistic thought had come to deny that detailed inquiry into universal grammar gave real insight into the structure of the mind. As an attempt to resurrect such inquiry, Beattie's project was a failure, but it did have a certain originality in its particular way of joining a conservative approach to language origins with a retrograde approach to linguistic-*cum*-cognitive analysis. Though not highly influential, it is of interest for its place in the development of the linguistic concerns of the Scottish Enlightenment and for the information it contains about contemporary pronunciations of English.

Beattie's life was one of great hardship. An impoverished childhood left him frail throughout a life in which his marriage broke down, the two children he adored died early deaths, and at the end he was left paralyzed by a series of strokes. Yet he inspired great admiration and affection in those who knew him – "We all love Beattie," as Dr. Johnson told Boswell – and his *Essay on truth* and *The minstrel* remained hugely popular for decades after his death in 1803.

Beauzée, Nicolas (1717–1789)

G Haßler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd.. All rights reserved.

Nicolas Beauzée was born in Verdun on May 9, 1717, and died in Paris on January 23, 1789. After the death of César Chesneau Du Marsais in 1756, he collaborated with editors of the French Encyclopedia, contributing articles mostly on grammar and language. In addition, he published an essay on religious matters, dedicated to moral education. His most important work outside the encyclopedia is a general grammar published in 1767 (Beauzée, 1974). Following the traditional explanation of the Bible, Beauzée argued for language as a divine gift. His interest in language resulted from his knowledge of ancient and modern languages. Beauzée was a teacher at the Royal Military School, and he signed his articles with the letters E.R.M. (École Royale Militaire). Beginning with the article *Formation*, this abbreviation appears in 135 entries of the encyclopedia. The majority of these articles must have been written by Beauzée, his collaboration with his colleague Douchet having been rather unsuccessful.

One of the merits of Beauzée as a theoretician of language is the improvement of metalinguistic terminology. His attitude toward orthography is contradictory. Writing his general grammar in 1767, he

example in the world around them" (Chap. 6). Language must have been received by "our first parents [...] by immediate inspiration"; this "first language, whatever it was, must therefore have been perfect," and had it not been for Babel, "it is probable, that some traces of it would have remained in every language to this day" (ibid.). Beauzée, Nicolas (1717–1789)

G Haßler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd.. All rights reserved.

Nicolas Beauzée was born in Verdun on May 9, 1717, and died in Paris on January 23, 1789. After the death of César Chesneau Du Marsais in 1756, he collaborated with editors of the French Encyclopedia, contributing articles mostly on grammar and language. In addition, he published an essay on religious matters, dedicated to moral education. His most important work outside the encyclopedia is a general grammar published in 1767 (Beauzée, 1974). Following the traditional explanation of the Bible, Beauzée argued for language as a divine gift. His interest in language resulted from his knowledge of ancient and modern languages. Beauzée was a teacher at the Royal Military School, and he signed his articles with the letters E.R.M. (École Royale Militaire). Beginning with the article *Formation*, this abbreviation appears in 135 entries of the encyclopedia. The majority of these articles must have been written by Beauzée, his collaboration with his colleague Douchet having been rather unsuccessful.

One of the merits of Beauzée as a theoretician of language is the improvement of metalinguistic terminology. His attitude toward orthography is contradictory. Writing his general grammar in 1767, he

attacked severely what he called *néographisme*. But three years later, he used a new system of orthography in his translation of Sallust.

For the publication of the general grammar, Beauzée was awarded a gold medal by Maria Theresia of Austria and appointed to the chair of grammar at the Royal Military School. Five years later, he became a member of the French Academy where he succeeded C. P. Duclos (1704–1772). Frederick II invited him to his court, but he refused to visit Berlin.

Beauzée professed a strictly rationalist grammar that was influenced by Port-Royal, but which followed its own principles. He defined general grammar as a science and opposed it to the grammars of particular languages, which he called art. The rules of scientific grammar should be universal and not depend on arbitrary properties of languages. The relation of language and thought is explained in a dualist way: Thought is independent of language, and language is an instrument of analysis, while simultaneously being a reflection of thought. In the area of differential semantics, he continued the analysis carried out by Gabriel Girard. As a phonetician, Beauzée thought that the role of the vocal cords was to vary the pitch of the voice.

In his most important articles on linguistic matters, Beauzée elaborated these principles, depending largely on Locke, Leibniz, and the Logic of Port Royal (1662), but he enlarged their epistemological basis by providing a mathematical explanation to identity. The identity of a noun and an adjective is explained by the adjunction of semantic features. On the other hand, determination is explained by the mathematical relation of intersection. Beauzée reduced all grammatical relations to either identity (concordance of adjective and noun, of subject and verb) or determination (prepositional groups, case, government of verbs). He made progress in explaining empirical phenomena through his participation in the Panckoucke edition of the *Encyclopédie Méthodique*, reworking his articles and adding new elements.

Becker, Karl Ferdinand (1775–1849)

K-Å Forsgren, Umeå University, Umeå, Sweden

© 2006 Elsevier Ltd. All rights reserved.

Karl Ferdinand Becker, German physician and grammarian, born in Lieser on the Mosel River, died in Offenbach. After finishing studies of medicine in 1801, Becker mainly devoted himself to the medical profession in various places. In 1815 he settled in Offenbach as a general practitioner. From 1820 Becker also gave English-speaking children lessons in German. Dissatisfaction with grammars of the Adelung tradition inspired Becker to his linguistic work. He was a member of the *Frankfurtischer Gelehrtenverein*, where he came to know and corresponded with leading German scholars and grammarians such as Jakob Grimm, Wilhelm von Humboldt and J. C. A. Heyse.

Most important are the publications in which Becker develops and applies his syntactic theory, especially *Organism der Sprache* (1827, 1841), *Deutsche Grammatik* (1829), and *Schulgrammatik*

der deutschen Sprache (1831). Becker's *Organism* belongs to the category of rationalist (philosophical or universal) grammar, especially as developed in France from the 17th century and in Germany from the end of the 18th century. Its aim was to deduce categories common to all languages from human thinking, which were supposed to be equivalent to the logical categories of Aristotle. However, unlike his predecessors, Becker does not slavishly try to derive the grammatical word classes from logical judgment, e.g., *The tree* (subject > noun) *is* (copula > the verb *be*) *green / a plant / the tree grows* (predicate > adjective, noun, verb), but rather builds his grammatical system on frequent clause patterns of natural language. He distinguishes between three different kinds of syntactic relations (*Satzverhältnisse*): the 'subjective', e.g., *The bird sings / is singing*; the 'objective', e.g., *The bird sings / is singing a song / beautifully*; and the 'attributive' relation, e.g., *the singing / blue bird*. Becker also distinguishes between **grammatical form** (word classes and flectional forms) and **grammatical meaning** (syntactic function) and describes **syntactic synonymy** (the fact that different word classes can have the same function in a clause) and **syntactic homonymy** (the fact that one and the same word can have different functions as a subject, object, etc.). Thus Becker draws a clear dividing line between word classes and clause elements, or, in modern terms, between category and function.

These distinctions are fundamental for the understanding of syntactic structure and must be regarded as an achievement of the 19th century, certainly not equal to those of comparative linguistics, but basically still valid today. The philosophical part of Becker's work, in which the notions 'organism' and 'logic' played a key role, was much admired by his contemporaries but was also the target of severe criticism, partly justified but also exaggerated and partly due to misunderstanding. One example is Heymann Steinthal's book *Grammatik, Logik und Psychologie* (1855), which brought Becker's name into disrepute and oblivion in the academic world. His syntactic system, but not his philosophy, lived on in a simplified form in elementary and higher schools. Even his academic opponents used it, perhaps unaware of its origin. In the 20th century it was still being questioned (e.g., by Hans Glinz), particularly as to its didactic application.

Bee Dance

J Tautz and B Bujok, Universität Würzburg, Würzburg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Honeybees, living together in colonies of tens of thousands of individuals, have evolved behavioral and physiological mechanisms that allow them to maintain the colony. Compared to most other insects, two aspects are especially important: to find their way between locations of relevance (orientation between the nest site and food sites) and to recruit nest mates (communication) to support in tasks in which many helpers are needed.

The so-called dance 'language' includes both aspects. The observed phenomenon is that after one bee has by chance discovered a food site or a new nesting site, a number of bees, up to half of the colony in the case of swarming, arrive at the site. It is obvious that something must have happened between the bees inside the nest that 'know' the location of interest and those that are recruited to that site. All steps in this communication contribute to a most complex behavior, the mechanisms of which are still not fully understood.

After a successful forager returns from a food or nest site, it performs a conspicuous movement termed the 'waggle dance.' In ~1945, the Austrian zoologist Karl von Frisch discovered a correlation between certain aspects of the waggle dance and the geographical situation linked to this form of signaling. This correlation was a topic of intense debate among scientists asking the question "is this an abstract language, in the sense that bees watching a dance can read this correlation precisely and use it, or not?" The picture that we have today is a mixture of both: the dance language communication is a highly complex system of signals between the bees and cues from the surroundings, and the waggle dance is the initial and most conspicuous step in that system.

The Problem

Honeybees can fly distances up to 10 km away from the hive to which they must return. Scout bees search during such flights for flowers, water, and resin from plants or for new nesting sites. Recruitment to flowers and water speeds up the exploitation by the colony; new nesting sites must be found quickly after a swarm leaves the old home. It is much more important for a swarm to find new shelter quickly than for additional bees to collect nectar from a certain spot. Thus, it may be speculated that a high selection pressure on quick and successful home finding led to the 'invention' of the dance communication, which, after it evolved, was then also used on a small scale as a preadaptation in food recruitment.

The different types of goals have different physical properties. The task is more difficult in recruitment to a new nesting site: It is a spot in the landscape that is not sending any cues into the surrounding area, enormous numbers of bees must be recruited to it, and mistakes can be fatal for the swarming colony. The task is easier in food site recruitment: Flowers do send visual (color) and olfactory (scent) signals, there are typically many flowers distributed over a certain area, only a small number of bees are recruited, and mistakes are not fatal (it has been shown that a colony will still collect enough food even after the dance language is disturbed artificially).

Recruitment of Swarms to a New Nesting Site

Swarming bees form dense clusters of thousands of bees hanging outside on a tree. From there, scout bees screen the landscape for suitable homes. Having discovered such sites, they return to the swarm and perform, on a vertical support formed by the bodies of the other bees, the so-called waggle dance (Figure 1).

The movement pattern is stereotypic and is composed of different segments: a waggle phase in which the bee waggles its body from side to side with a repetition rate of approximately 15 waggles per second. Return runs, during which the bee walks in a loop back to where it started the first waggle phase,

Figure 1 A successful forager returning from a food source performs a conspicuous movement pattern, the so-called waggle dance, in the darkness of the hive.

occur after termination of the waggle phase. Subsequently, the movement pattern is repeated with the next return run directed to the other side. A complete sequence is repeated many times. Figure 2 displays the correlations to the geographical situation, as discovered by von Frisch.

The time span of the waggle phase correlates positively with the distance between the nesting site and the swarm location (Figure 3); the direction of the waggle phase in relation to the direction of gravity gives the angle in the geographical triangle comprising the swarm location, the sun, and the new nesting site. In a fascinating process of consensus formation, initially many different sites are announced, but finally only dances for the best site continue.

The problem now emerges: How do 20 000 bees obtain the information about the location of the new nest site when only a few bees danced on the surface of the swarm cluster? The few bees that dance interrupt their dancing now and then, visit the new site, and mark its vicinity and entrance with scent. In successive visits to the new site, more and more bees arrive there, fly around the site, and possibly scent mark it. Scouts then return to the swarm and dance. After some time, a communication process in which rising body temperature and vibration signals play a role stimulates the swarm to become airborne. What then helps the swarm to move in the correct direction are the conspicuous flight patterns of the bees that 'know' where to go, seemingly again the nest site scouts: One can watch bees flying fast and straight among the swarm bees, directing their route in the correct direction. Near the nesting site, a group of bees (again former dancers) perform slow and looping flights and scent the air around the site and the nest entrance with pheromones. Altogether we have here a complex communication process with signals in each step of the recruitment until the new nest site is occupied.

Recruitment to Food Sources

The waggle dances that we see in food source recruitment are identical to those in nest site recruitment but, in contrast to swarming, they happen in large numbers each summer day and thus can be studied easily.

Each recruitment process can be divided into five steps, which can be analyzed separately.

1. The sender must collect information it wants to pass on.
2. The sender and receiver must establish contact (direct or via media).
3. The sender must send information.
4. The receiver must receive information.
5. The receiver must use all or part of the information.

For the dance communication, these five steps are detailed as follows:

Information Collection by the Sender

The condensed information encoded in the waggle dance figure about the route to the goal is the vector that gives the direction and distance from the starting point to the goal. Before sending these details, the dancer must collect this information. The source for both sets of information is the visual sense of the bees. The direction is experienced by seeing the sun as the reference or, if the sun is hidden behind clouds, the polarization pattern in the sky. The distance is estimated by the so-called optic flow, i.e., the pictures shifting across the eyes of the bees during flight movement. This can be demonstrated by forcing

Figure 2 The dance figure contains information, maximally compressed, about the direction and distance to the food source.

Figure 3 The distance from the hive to the goal is encoded in the duration of the 'waggle phase.'

Figure 4 The central part of a waggle dance is the 'waggle phase.' It used to be called the 'waggle run' but we now know that 'waggle stand' is more appropriate as the bee clings with its feet to the rims of the cells to attain mechanical stability.

Figure 5 The mechanical properties of the comb are tuned to the frequencies produced by the dancing bee (at approximately 270 Hz). It amplifies the mechanical signals that are produced by waggle dancers and makes them conspicuous over the background noise of the colony.

bees to fly on their route to the food through narrow tunnels and thus close to visual patterns that then generate pictures moving at a rapid rate across the eyes. Such bees indicate in their waggle phase the subjective impression of a flight more than 30 times as long as the flight that they actually completed.

Sender and Receiver Establishing Contact

The dance language for food sources is performed in the darkness of the hive and is of interest to only a comparably small number of bees. Therefore, it makes a great deal of sense that there is a limited area of approximately 10 × 10 cm on the vertical surface of a comb, the 'dance floor,' on which the dancers and those motivated to meet dancers get together. The dance floor can be artificially relocated in the hive and the dance-communicating bees find it quickly to perform their communication, which indicates that it is recognized by scent.

How is a dancer detected in the darkness? Dancers emit a suite of signals and cues linked to the dance performance. These include mechanical, chemical, and thermal events. A dancing bee has a high body temperature, it smells like the food source it comes from, and it produces mechanical signals, each of which can be used to locate a dancer. The mechanical signals are the waggle movement itself and a burst of muscle contractions by the flight muscles located in the wing- and leg-carrying body segment, the thorax. During the dance, the wings are only loosely coupled to the flight muscles so that only small wing vibrations happen, which produce a faint wind detectable by bees standing nearby. The muscle oscillations are additionally transmitted as vibrations into the comb. To efficiently transmit this signal into the substratum, during the waggle-phase the dancing bee clings to the comb with its feet for as long as possible (see Figure 4).

Figure 6 The dance follower bees receive from the bee dancer temporal contact patterns to both antennae from which the direction of the waggle phase can be read in the darkness of the hive.

Figure 7 The information on flight distance, encoded in the waggle phase of the dance, is not absolute but depends on the landscape. A waggle duration of 400 ms can for one flight route mean 110 m and for another flight route mean 230 m.

The vibrations introduced into the comb travel as displacements in the form of a shifting of the net made from the upper rims of the cells of the comb.

It is remarkable that the mechanical properties of the comb are well adapted to the properties of the signals. The 'telephone net' of the bees, built by the bees themselves, best transmits frequencies at approximately 270 cycles/s, which is the frequency contained in the oscillation pulses produced by the dancer (see Figure 5).

Sending and Receiving the Signals

Once the dance followers have located and approached a dancer and in that way made contact, the dance followers move around with the dancer in a ballet-like manner. Each step of the dance follower is as stereotyped, but less conspicuous, as the movements by the dancer. During this ballet performance, the sender and receiver keep intense body contact. In particular, the antennae of the dance followers are touched in a certain temporal pattern by the wagging body of the dancer (Figure 6). It is during this contact that the information is transmitted and the antennae play an essential role. However, there is still a large gap in our knowledge about the details of this process.

Using the Information

Correlations do not prove causal relationships. Therefore, it was debated intensely whether and how much of the information that a human observer can read from a waggle dance is actually used by the follower bees. The arguments ranged from "it is an abstract language" to "they use nothing but are stimulated by the dance to simply search for the source of the scent that a dancer bee carries."

It turned out that the truth is a combination of both assertions. The dance transmits information and aids in the field are given to pinpoint the goals. If forager bees are forced to fly through narrow tunnels that produce a high rate of optic flow, one can create 'lying' bees. These bees dance for a different location than that which they actually found, by performing a waggle phase for more than 30 times as long a distance as they had really flown. Observing the recruits, it becomes clear that they do not fly to the forager's real site, but they can be caught in an area around the spot indicated by the dance. Thus, the dances recruit followers in roughly the correct area.

Because the distance communicated depends on the optic flow that a landscape offers to the bees, it is clear that bees do not communicate distance as an absolute quantity (Figure 7). However, as long as

Figure 8 The 'dance language' is a highly complex phenomenon in which multiple translations of information within one bee and between sender and receiver bees take place. The dance language is one form of information transfer embedded in a continuous flow of information between the members of a honeybee colony.

follower bees fly out in the same direction as the dancer, the 'mistakes' that both bees make are the same and cancel each other out.

However, nonmanipulated dancers also send recruits not to a spot, but into a larger area. This area has an almost constant size independent of the distance from the hive. The reason for this is that the directions of consecutive waggle phases are not perfectly identical but show a certain degree of deviation. This deviation is smaller the further away the food source is. This leads to a scatter of the follower bees across a certain range and it makes more sense than having all bees that followed a dance go to one flower.

The identification of flowers in the area that bees have been sent to is thus easy to accomplish when recruited bees follow the scent of flowers. When bees are offered unscented food, events identical to the swarming recruitment result: Experienced bees synchronize their flight so they arrive in groups at the feeder, and once there they fly around in slow looping movements and release scent from a special gland to mark the area. Inexperienced bees then land together with experienced bees at the food source.

Thus, it becomes clear that bees keep contacts and exchange signals not only during the waggle dance. The waggle dance is one component, and the most conspicuous component, in a highly complex communication process in honeybees (see Figure 8).

The term 'behaviorism' refers to a family of doctrines that emphasize the importance of behavior over mind, or cognitive processing, in psychology, notably as its proper subject matter or its ultimate evidential basis.

Psychological Behaviorism

Early in the 20th century, James Watson wove together three 19th-century ideas – Darwin's evolutionary theory emphasizing the physical as well as psychological continuity between animals and humans, Wundt's experimental method in psychology, and James's functionalist psychology – into both a method and theoretical overview for animal and human psychology. In 1913, he published what came to be known as

the behaviorist manifesto, '*Psychology as the behaviorist views it*,' which contained a number of distinct but related doctrines, three of which are of particular interest for the student of language: (1) the rejection of introspection as an experimental method, (2) the shunning of internal events, and (3) the emphasis on learning.

Rejection of Introspection as an Experimental Method

In the late 19th century, Wundt convinced psychologists that scientific work in their discipline must be experimental and quantitative, but like all 19th-century psychologists, he continued to work on psychology's traditional object – consciousness – and to access it by the traditional route of introspection. Stirred by a growing methodological distrust in the value of introspective evidence, and emboldened by various successes in animal psychology in which introspective data were not available, Watson, trained as an animal experimenter, argued that consciousness and introspection were not a proper basis upon which to establish an experimental scientific psychology. According to Watson, experimentation in psychology begins and ends with observable behavior, a methodological prescription that is sometimes called 'methodological behaviorism.' To this day, virtually all working psychologists, even those who see themselves as strong opponents of behaviorism, adhere to Watson's methodological prescription. For this reason, it is better to reserve the term behaviorism for the other behavioristic doctrines present in Watson's manifesto.

Shunning of Internal Events

If all internal events are characterized by the fact that they are conscious and accessible only through introspection, then Watson's rejection of conscious experience as the object of psychology amounts to a rejection of all internal events from the scope of psychology. Indeed, we find in Watson's writing a move from his initial 1913 doubts about the epistemic value of internal events (*qua* conscious events) to the full-fledged elimination of everything internal found in his 1924 monograph *Behaviorism*. However, the elimination of everything internal, a position we could call eliminative methodological behaviorism, which is one of the two main tenets most strongly identified with behaviorism today, is only one way to meet Watson's methodological prescription. The other is to view internal events as theoretical constructs, the value of which flows from behavioral observations. According to this position, internal events can be posited as theoretical construct provided they are 'operationally defined' into behaviors. Few psychologists, even among those we would undeniably classify as behaviorists today, followed Watson's shunning of internal events. Edward Tolman and Clark Hull, for instance, were much more ready to posit internal events (drives, internal maps, etc.) as intervening variables mediating the relation between stimuli and responses. Even Skinner found a heuristic place for internal events in his Experimental Analysis of Behavior (EAB), but reduced their epistemic value within psychology.

We can call this position, held by most behaviorists, 'operationalist methodological behaviorism.' In their day-to-day practice, most psychologists today are operationalist methodological behaviorists. To see what distinguishes those operationalist methodological behaviorists we call behaviorists from those called, say, cognitive psychologists, one has to look at the third element found in Watson's behaviorist manifesto, the emphasis on learning.

Emphasis on Learning

Whereas the first two doctrines found in Watson's manifesto are methodological, the third is theoretical. The main construct on which Watson established his psychology is the reflex; indeed, he opened his 1924 monograph with an analysis of the yawning reflex. However, Watson recognized that basic reflexes, which are fixed and innate stimulus-response (S-R) dispositions, have insufficient explanatory power to account for the behavior of many animals, and certainly those that interested Watson: birds and mammals, including humans.

To achieve the necessary explanatory power, Watson turned to the work of Russian physiologist Ivan Pavlov (1927), who had recently won the Nobel Prize in medicine for his work on a type of learning called classical conditioning. Pavlov showed that, when the temporal contingencies are right, stimuli that are neutral to the organism can be paired with innate (or unconditioned) S-R dispositions so as to acquire the ability to trigger the reflexes' response. Once the new association is established, there is a new, conditioned S-R disposition in the organism's behavioral repertoire. Since so many of human behavioral dispositions are not innate, Watson hoped that classical conditioning would offer a means to account for what is typically human in human psychology. Note that Watson's emphasis on a learning mechanism does not make him an empiricist: indeed, for his own brand of behaviorism to get off the ground, he needs to posit a large number of innate unconditioned reflexes. With the development of the concept of operant conditioning, and to the extent he

relegated classical conditioning to a secondary role, Skinner was actually much more of an empiricist than Watson ever could be.

Skinner developed both a school of psychological research – the Experimental Analysis of Behavior – and a philosophy to underwrite it, called radical behaviorism (Skinner, 1938, 1974). According to EAB, every behavior can be broken down into three parts: the discriminative stimulus (the type of situation the organism is in), the operant response (a response that can be modified as a function of its consequence), and another stimulus: the reinforcer or punisher – an event that increases (reinforcement) or decreases (punishment) the probability that the organism will produce the operant response in the presence of the discriminative stimulus. Operant conditioning, a general learning mechanism, is said to have occurred when a stimulus has increased or decreased the probability that an organism will produce a given operant response when the discriminative stimulus is present.

Unlike Watson's elimination of inner mental states, Skinner's EAB did not shy away from them, but viewed them as operant responses, which could be reinforced or punished by stimuli. Contrary to psychological tradition, however, inner mental states were not seen as causes of behavior, but rather as behaviors (operant responses) in their own right, to be controlled by external stimuli like any other operant response. And unlike classical conditioning – the learning mechanism favored by Watson – operant conditioning is a *creative process*, much the same way natural selection is, allowing for the selection of new responses. Armed with operant conditioning and classical conditioning to a lesser extent, Skinner believed he could account for any human behavior.

In his discourse on method, Descartes famously set a limit on mechanistic explanation in psychology. No mere mechanism could, he believed, account for the productivity and pragmatic appropriateness of language and reasoning. In his 1957 work, *Verbal Behavior*, Skinner sought to show that, by applying the concepts and methods of EAB, one could mechanistically account for both the productivity and pragmatic appropriateness of language. His account of pragmatic appropriateness took sentences as wholes and showed how the environment, especially the verbal community, provides reinforcers and punishers to shape verbal responses. His account of productivity focused on words and attempted to show how sentences are structured by reinforcers and punishers provided by the child's verbal community.

In a famous review of Skinner's book, Chomsky (1959) attacked Skinner's behaviorist account of language. Chomsky set up a two-horn dilemma on which Skinner could only impale himself. Either Skinner uses EAB's theoretical terms in a strict and controlled way – that is, as he defined them operationally – or he interprets them in a loose and metaphorical way. If he interprets its terms in a loose and metaphorical way, then his analysis of language amounts to nothing but a disguised form of mentalism. On the other hand, if Skinner interprets EAB's theoretical terms as he defined them operationally, then, according to Chomsky, Skinner's behaviorism could not account for language.

Operant conditioning shapes verbal behavior by differentially reinforcing and punishing verbal output. One can easily see how this process could account for the pragmatic appropriateness of verbal responses in anyone who can produce them. (Chomsky did not emphasize this aspect of verbal behavior, perhaps because he himself did not have an account of pragmatic appropriateness.) However, according to Chomsky's famous "poverty of stimulus argument," operant conditioning cannot account for the acquisition of the capacity to produce grammatical verbal responses. The linguistic environment (the stimulus) is said to provide children with insufficient evidence – to be precise, evidence that was too *unsystematic* and too weak – to acquire the grammar of the language spoken around them: unsystematic because it contains no negative evidence (evidence that identifies ungrammatical verbal output as ungrammatical) and *weak* because positive evidence (evidence that identifies grammatical verbal output as grammatical) is of low quality. Moreover, because children hear only a small finite subset of all the grammatical sentences of their language, they cannot take the absence of a grammatical form as evidence of ungrammaticality. Yet, despite the poor nature of the stimulus they get from their verbal environment, children normally acquire their native language quite rapidly.

Over the years, every element of this argument has been argued extensively. Skinner himself never bothered to reply to Chomsky since it was obvious to him that Chomsky had not read his book. As noted, *Verbal Behavior* did in many ways offer an account of language's pragmatic appropriateness (one of Descartes' challenges to a mechanistic explanation of the mind), something that formal grammars cannot. However, Chomsky was right in claiming that Skinner's book offered no clue to the productivity of language (Descartes' other challenge), whereas his own did. One could say in retrospect that the score between Skinner and Chomsky is one-all. Nevertheless, by the 1960s, the tide had turned against

behaviorism, and the time was ripe for cognitive science. Chomsky's attack on Skinner's *Verbal Behavior* was seen as one of the definitive moments in the birth of cognitive science.

Philosophical Behaviorism

Philosophical behaviorism is a semantic theory about the meaning of mental statements; that is, statements used to attribute mental states to oneself or another. Although philosophical behaviorism generally is often identified with the particular brand developed by neopositivists, it is important to note that it has three main strands. They are, chronologically, the reductionist philosophical behaviorism of the Vienna Circle and two related but distinct responses to it: the nonreductionist philosophical behaviorism of ordinary language philosophers and the eliminativist philosophical behaviorism of Quine. All of these positions are behaviorist in that they posit a special relation between behavior or behavioral statements and the meaning of mental statements. What distinguishes the three is the type of relation they posit.

Reductive Philosophical Behaviorism

Developed by members of the Vienna Circle as part of their unity-of-science program, reductionist philosophical behaviorism (also called logical or analytical behaviorism) posits that there can be semantic identity between mental statements and (a finite subset of) behavioral statements. Two specific neopositivist theses are at the heart of this approach: (1) positivism – the rejection, as meaningless, of metaphysics and pseudosciences from the unified system of the human knowledge (science) and (2) atomistic verificationism, the view that theoretical statements, taken individually, draw their meaning from their relation of semantic identity to special foundational statements, called 'physical control formulas,' the truth of which, individually, is taken to be directly verifiable by observation. Note that, although atomistic verificationists (and many contemporary commentators) use terms like 'synonymy' to characterize the type of semantic relation posited and 'translation' to characterize the operation carried on to establish the semantic relation, neither terms should be confused with its homonym in ordinary language. Rather, the relation of semantic identity posited by atomistic verificationists is akin to the relations of definition in mathematics or of compilation in computer science (both are relations between elements in formal languages).

Anyone who holds these two views, and believes in the value of psychology as a science will strive to show that psychological statements, as theoretical statements, are semantically identical to physical control formulas: physiological and behavioral statements. Hence, Hempel claimed that 'Paul has a toothache' was semantically identical to 'Paul weeps and makes gestures of such and such kinds'; "At the question 'What is the matter?' Paul utters the words 'I have a toothache'"; and so on (Hempel, 1949: 17).

Just as cognitive science was in part developed as a reaction to the limits of psychological behaviorism, in particular Skinner's EAB, much of the original philosophical background underlying cognitive science was developed through a thorough reflection on the limits of philosophical behaviorism. Indeed, three broad philosophical views on the mind emerged from a reflection on the limits of reductionist philosophical behaviorism: nonreductionist philosophical behaviorism, eliminativist behaviorism, and functionalism. This article addresses the first two (*see* **Functionalist Theories of Language** for the third).

Nonreductive Philosophical Behaviorism

Whereas neopositivists aimed to show that mentalist psychology could be a part of the unified system of science, ordinary language philosophers wanted to understand the day-to-day use of language, including mentalistic language (language that contains mental statements and thus can be used to make mental attributions). First, ordinary language philosophers observed that mental attributions are, first and foremost, a mundane practice and that mentalist language may be ill suited to a scientific endeavor such as psychology. Simply assuming that mental statements were well suited for scientific work because of their value in ordinary human practices was deemed to be a category mistake (Ryle, 1949), or as Wittgenstein put it, to misconstrue the logical grammar of language (Wittgenstein, 1953).

The main error thus made was to assume that mental statements ascribe 'states,' presumably mental ones, but the criticism extended to other types of states (neurological, functional) of individuals. Instead, mental statements attribute complex behavioral dispositions or behavioral patterns to individuals. Such patterns are taken to be so complex that mental statements cannot in practice be reduced to them. Thus, according to nonreductive philosophical behaviorists, when we attribute a mental state to someone, we are not ascribing a given internal state to that person, but are using shorthand to describe what the person might do in various circumstances.

Ordinary language philosophers based their opposition to the brand of philosophical behaviorism developed by neopositivists on two related problems

they saw with reductionist philosophical behaviorism. The first was that reductionist philosophical behaviorists conflated two distinct notions under the heading 'behavior': sometimes, the term referred to movements (of the body), and sometimes it referred to actions (of the person who has that body). Although movement statements can be properly viewed as physical control formulas, action statements cannot. The reason why action statements cannot be viewed as physical control formulas pointed to the second problem that philosophical behaviorists saw with reductionist philosophical behaviorism: the intentional circle (Geach, 1957). The intentional circle refers to the fact that a given mental statement is semantically identical to a given action statement (or set thereof) only on the condition that the person the mental state is attributed to also holds other mental states, and that, to attribute those, one would use mental statements themselves semantically identical to actions only on the condition that the person holds other mental states; and so on, indefinitely. Psychological theoretical statements are thus shown to be irreducible to physical control formulas. The intentional circle argument is a particular instance of a more general argument that applies to any attempt to use semantic identity to justify the reduction of theoretical statements individually to physical control formulas. Let us turn to that more general argument.

Eliminative Philosophical Behaviorism

Atomistic verificationism is at the heart of the neopositivist conception of science, including its reductive philosophical behaviorism. The intentional circle argument brings into question the idea that psychological theoretical statements can be translated solely into physical control formulas – that is, without referring back to other psychological theoretical statements. It is as if all statements, theoretical and observational, are a connection in a kind of network. Drawing on Pierre Duhem's confirmation holism, Quine broadened the scope of the intentional circle argument to cover all of the sciences: confirmational circularity between theoretical and observational statements becomes the norm rather than psychology's exception. Holding on to verificationism, which ties meaning to observational confirmation, Quine rejected atomistic verificationism in favor of holistic verificationism. Behaviorism in psychology thus stops being a peculiarity in the sciences, owing to the quirky nature of its theoretical statements, but equal in that regard to theories in other sciences.

Having thus broadened the ordinary language philosopher's argument against reductive philosophical behaviorism, Quine could have opted for their nonreductive behaviorism. However, he supplied his argument against reductive behaviorism with an argument against all intensional language in science; that is, all language in which extensional inference principles, such as existential generalization and the intersubstitutability of identicals, fail. Nevertheless, Quine's position was quite similar to that of the nonreductive behaviorists. They both rejected reductive behaviorism and mentalist scientific psychology: Quine, because of his rejection of intensional language generally, and ordinary language philosophers because they viewed with suspicion any extension of ordinary linguistic practices to science.

The Return of Psychological Behaviorism?

Most accounts of psychological behaviorism end with Chomsky's successful attack on Skinnerian behaviorism, and most accounts of philosophical behaviorism end with Quine's broad attack on neopositivist reductive physicalism, forgetting that he replaced reductive behaviorism with a more radical eliminative behaviorism. However, since most linguists and psychologists did not follow in Quine's eliminative footsteps, opting instead for the then-growing paradigm of cognitive science, which promised a science of intentionality, a modern student of psychology and linguistics may thus be led to believe that behaviorism is long dead and buried.

However, various elements of behaviorist thinking are making a comeback. Eric Kandel won the Nobel Prize in Medicine in 2000 for his discovery of the molecular basis of three related forms of learning: sensitization, habituation, and classical conditioning (see Kandel *et al.*, 2000). In addition, many neural modelers are now replacing back-propagation in their connectionist models of cognitive capacities with reinforcement learning algorithms, inspired by Skinnerian learning mechanisms. Those algorithms have certain computational advantages over back-propagation that make them more suitable for learning in complex systems, and they are thought to be much more biologically plausible than back-propagation. Moreover, the physiological mechanisms of reinforcement learning are currently being worked out and are thought to involve dopamine and dopaminergic systems as reward systems. Finally, a new trend in robotics, suggestively called Behavior-Based Robotics, shuns central representations and computational systems in favor of simple behaviors strategically connected in a subsumption architecture (Brooks, 1999).

The two questions to ask, a half-century after the initial rejection of behaviorism by cognitive science, is not whether behaviorism is false (it is) but (1) to what extent does our intelligence rely on reflex-like input-output or a modular mechanism, and (2) to what extent is our cognitive life shaped by the type of learning mechanisms studied by behaviorists?

Belarus: Language Situation

U Schasny, Minski rayon, Belarus

© 2006 Elsevier Ltd. All rights reserved.

Belarusian, as the language has been termed in English since the creation of an independent state of Belarus with the collapse of the USSR in 1991, is also variously known as Byelorussian or White Russian (or Belarusan, per Ethnologue), and along with Russian and Ukrainian is a member of the eastern branch of the Slavonic language family. It is written in the Cyrillic script and is one of the two official languages of the republic of Belarus, along with Russian.

The exact number of speakers of Belarusian is difficult to quantify because of hazy and subjective definitions of what constitutes Belarusian as distinct from dialects of Russian. Census figures in contemporary Belarus are somewhat misleading, as although 85.5% of the population of the republic listed Belarusian as their first language in the 1979 census (and Ethnologue, in its 2000 edition, provided a 1993 figure of 98%, or 7 905 000), what is defined as 'Belarusian' may be more like Russian than the acknowledged literary standard of Belarusian. Consistently weak institutional support for the literary language in Belarus has served to confuse the situation.

Nevertheless, Belarusian as a distinct language from its neighbors has a long, if somewhat checkered, history. The area in which the Slavonic dialects that fused into the Belarusian language sprang up was defined by the Pripyat', Dvina, and Dnepr rivers,

The two questions to ask, a half-century after the initial rejection of behaviorism by cognitive science, is not whether behaviorism is false (it is) but (1) to what extent does our intelligence rely on reflex-like input-output or a modular mechanism, and (2) to what extent is our cognitive life shaped by the type of learning mechanisms studied by behaviorists?

Belarusian, as the language has been termed in English since the creation of an independent state of Belarus with the collapse of the USSR in 1991, is also variously known as Byelorussian or White Russian (or Belarusan, per Ethnologue), and along with Russian and Ukrainian is a member of the eastern branch of the Slavonic language family. It is written in the Cyrillic script and is one of the two official languages of the republic of Belarus, along with Russian.

The exact number of speakers of Belarusian is difficult to quantify because of hazy and subjective definitions of what constitutes Belarusian as distinct from dialects of Russian. Census figures in contemporary Belarus are somewhat misleading, as although 85.5% of the population of the republic listed Belarusian as their first language in the 1979 census (and Ethnologue, in its 2000 edition, provided a 1993 figure of 98%, or 7 905 000), what is defined as 'Belarusian' may be more like Russian than the acknowledged literary standard of Belarusian. Consistently weak institutional support for the literary language in Belarus has served to confuse the situation.

Nevertheless, Belarusian as a distinct language from its neighbors has a long, if somewhat checkered, history. The area in which the Slavonic dialects that fused into the Belarusian language sprang up was defined by the Pripyat', Dvina, and Dnepr rivers,

and the tribes that inhabited this area were known to medieval chronicle writers as the Krivichi, Radimichi, and Dregovichi. The borders of the modern Belarusian state roughly correspond to this linguistic area, with some overlap of the language westward into Latvia and Lithuania.

Linguistic and archaeological evidence suggests, in fact, that the Slavic-speaking tribes conquered and absorbed Baltic-speaking populations within this area and spread westward, and in fact by the 11th century the important trading city of Polotsk (Polatsk) was the dominant political and economic force along the Dvina and Daugava rivers as far as the Baltic sea. The Russian city of Smolensk is also thought to have been founded by the Krivichi tribe. For a time in the 15th century a language that was recognizably proto-Belarusian was in use as the official administrative language of the Grand Duchy of Lithuania, which stretched as far as the Black Sea.

Legal codes of the Duchy, and the partial Bible translations by Francis Skaryna in the 16th century, constitute the first evidence of a Belarusian literary language. But the flowering was not to last, as its use was suppressed with the advent of the Polish-Lithuanian Commonwealth starting in 1569 – Polish was used exclusively on its territory for administration from 1696 on.

It was the disbanding of this commonwealth at the end of the 18th century that gave rise to a second flowering of Belarusian literature, and under Polish influence, the Latin script was in use for the ensuing century, even into the 20th century, though not uniformly, and use of the traditional Cyrillic script continued throughout, until being made the official orthography early in the Soviet period in the 1920s.

Features of the Language

Belarusian is written in a version of Cyrillic that is almost identical to Russian, with the addition of the dotted vowel İ. Characteristic of Belarusian are the affricates *ts* and *dz* in some positions where Russian has *t* and *d*. Syllable-final *w* is found, corresponding to Polish *ł*. Representation of unstressed vowels as spoken (particularly the *o/a* distinction) is more faithful in Belarusian spelling. As in Russian, words have movable stress. The grammar and syntax of Belarusian are not markedly different from that of Russian.

Codification and Status

A grammar of Belarusian did not appear until 1918, with that of Branislaw Tarashkevich. The norms set out in that volume, which was a conscious attempt to synthesize the literary language from a variety of dialects, helped to codify the official language of the Belarusian SSR. The Cyrillic script in its native form was set by decree in 1933, but also at this time, under Stalinism, the grammatical and spelling norms were aligned closer to Russian. The Stalin era inaugurated a demotion in the status of Belarusian that to this day has never truly been reversed. Schools and the press almost exclusively used Russian, and still do, with literary Belarusian marginalized as an 'academic' language. To some extent the written language has been kept alive by an active diaspora living in the West, while the spoken language of the home was, by implication, reduced to the status of a 'Russian dialect.'

Nationalist activity within the country in the dying days of the USSR, however, saw the achievement of a higher status for the language, culminating in a Language Law of 1990 that gave the language sole official status in the country. Under the present neo-Soviet administration of Belarus, the legislative achievements of the nationalists have been largely undone, especially as the result of a referendum in 1995, by which Russian was given equal official status. For the foreseeable future, then, the majority language will officially be a pariah in its own country.

This article is reproduced from the previous edition, volume 1, pp. 323–324, Elsevier Ltd.

Belgium (population in 1991: 9 970 000) recognizes three languages as official: Dutch, French, and German. Taking these language names to refer not only to the standard varieties but also to the vernacular forms spoken on Belgian soil, it can be stated that slightly less than three-fifths of the indigenous population have Dutch as their mother tongue, slightly more than two-fifths have French, while German is the mother tongue of less than 1%. Language-related disputes concerning the status of Dutch and French have long been prominent in Belgian public life and, especially since the 1950s, have occasioned a number of constitutional changes. Most political parties and many other organizations come in pairs, one for French speakers and the other for Dutch speakers.

Four linguistic regions are officially recognized: Flanders, with Dutch as the official language (a single variety of Dutch serves as the standard language in both the Netherlands and the north of Belgium); Wallonia, with French as the official language; the Brussels region (in French, *Bruxelles-Capitale*), which is officially bilingual; and a region with German as its official language, forming a narrow (broken) strip along the border with Germany in the province of Liège. In addition to the four regions, three Cultural Communities (corresponding to the official Dutch, French, and German-speaking sectors of the population) are recognized in the Constitution; each has a council with various 'cultural' responsibilities (e.g., broadcasting, promotion of tourism).

The official linguistic boundary (legally recognized in 1962) between the largely Dutch-speaking north (i.e., Flanders) and the overwhelmingly French-speaking south (i.e., Wallonia), after delimiting a small 'French' area around Comines, runs roughly due east from just north of Mouscron (about 15 km to the northeast of Lille) to the southern boundary of the 'panhandle' part of the Netherlands (near Maastricht). Four of Belgium's nine provinces lie to the south of the line and four to the north. The centrally located province of Brabant, however, is exceptional in two respects: the linguistic boundary splits it into a northern and southern part and the officially Dutch-speaking northern part 'surrounds' the Brussels region. Although Brussels is officially bilingual, over three-quarters of its inhabitants now have French as their main or sole language.

The local forms of French in Wallonia can be grouped into three main dialects, of which only one, albeit the largest, is termed 'Walloon' (French: *wallon*); the others are Picard and Lorrain. The local forms of Dutch spoken in Flanders (often called 'Flemish'; Dutch: *Vlaams*) also can be grouped into three main dialects. These are (from west to east) West Flemish, Brabantic (including East Flemish), and Limburgish. Use of non-standard local forms of French and Dutch, especially of the latter, is widespread. The vernacular forms of Flemish differ considerably from Standard Dutch.

The part of Belgium in which German is the official language comprises two areas in the extreme east of Liège province; the principal town of the northern area is Eupen and that of the southern is Saint Vith/Sankt Vith. German also has some official status in areas immediately to the west (for example, in and around Malmédy). The vernacular forms of German that are spoken in the region belong to the Middle Franconian dialect group.

In the Arlon area (southeast corner of the province of Luxembourg) there are between 20 000 and 40 000 speakers of a different variety of German, called '*Lëtzebuergesch*' (part of the Moselle Franconian subdivision of the Middle Franconian dialect group). In contrast to the neighboring Grand Duchy of Luxembourg (where a form of it enjoys the status of national language), Lëtzebuergesch is not official in Belgium.

Among the considerable immigrant population (amounting to about a tenth of the total), French is the most commonly acquired Belgian language. People of Italian origin form the largest non-native ethnic group; there are also, in the 1990s, many immigrants from Southern Europe and neighboring areas (e.g., Morocco, Turkey, Spain, and Greece).

Both French and Dutch are extensively used in publishing and broadcasting. In the German-speaking region of Liège province there are radio stations broadcasting in that language as well as a German-language daily newspaper. In education, pupils in Flanders learn through the medium of Dutch but

are taught French as a subject; in Wallonia, where French is the medium, Dutch is now taught as a subject.

Belize: Language Situation

G Escure, University of Minnesota, Minneapolis, MN, USA

© 2006 Elsevier Ltd. All rights reserved.

Belize's small territory – barely 13 000 square kilometers of the Yucatan Peninsula – harbors a rich diversity of cultures and languages because of its pivotal geographical position at the juncture of Central America and the West Indies. Belize was the British colony of British Honduras from 1862 until 1981, and it is the Central American country with the highest percentage of English speakers (28%) for a population of 240 204 (Population Census 2000). In addition to English, four other languages are spoken in this multiethnic, multilingual society (Maya, Spanish, Garifuna, and German). However, the label 'English' is a misnomer, because English varieties spoken in Belize range over the broad spectrum that is characteristic of creole situations. The primary lingua franca is the basilect, Belizean Creole (BC), and associated mesolectal and acrolectal varieties (*see* **Variation in Pidgins and Creoles**).

BC developed as a contact language in the context of varied Amerindian, Indo-European, and African influences that turned Belize into a microcosm of colonial history. The great Mayan civilization had all but disappeared when the Spaniards visited the Bay of Honduras in the 16th century to extract precious woods from the densely forested interior. Pirates and buccaneers of various origins freely roamed the Caribbean reefs and coast (Belize may derive its name from Wallis or Wallace, a Scottish buccaneer). But there was no permanent settlement until the late 17th century, when the English transported African slaves from their colony of Jamaica to Belize to work in logging (mostly mahogany) camps. There is no detailed account of the origins of Afro-Belizeans, but various sources and records indicate that slaves were brought from several West Indian islands, as well as directly from Africa (the Bight of Benin, Congo and Angola). Later, 2000 English settlers, their African slaves and Miskito allies moved to British Honduras as they had to be evacuated from the Mosquito Shore (now in Nicaragua) in 1787, after the British Settlement was ceded to Spain (Grant, 1976; Bolland, 1988; Escure, 1997).

The original Mayas still live on the fringes of Guatemala and Mexico, and different dialects are spoken by Kekchis in the south, Mopaneros in the west, and Yucatecos in the north. The population was further diversified by the immigration of members of the Garifuna group (Afro-Arawak/Carib) who, after deportation from St. Vincent to Honduras in 1797 and subsequent vicissitudes, moved to Belize in the 19th and 20th centuries (Taylor, 1977; Escure, 2004a). East Indians were also brought as indentured servants after emancipation. The largest ethnic

Table 1 Ethnic groups in Belize in 2000: total population = 240 204

East Indian	Belizean Creole	8020 (3.3)
Other (Chinese, Lebanese Whites/British, US)	Cantonese, Arabic	3559 (1.5)

[a]Garifuna is now endangered as its speakers adopt BC as L1 (Escure, 2004a).

Table 2 Ethnic groups in the six districts of Belize

Districts	*Creole*	*Garifuna*	*Mestizo*	*Maya*	*Other*
Corozal	7.6%	1.3%	74.1%	5.0%	12.0%
Orange Walk	7.4	1.2	71.7	9.1	10.6
Belize	67.9	5.3	18.7	1.2	6.9
Cayo	23.0	1.7	58.0	8.7	8.6
Stann Creek	25.1	36.2	23.7	8.0	7.0
Toledo	5.7	10.0	11.9	62.8	9.6

migration was that of Mestizos (Spanish/Indian refugees of the Indian Caste War in Mexico), who settled in Belize after 1848. Refugees from El Salvador, Guatemala and Honduras have recently increased the Belizean population by at least 15% since the 1991 census (Escure, 1997, 2004b). Finally, Mennonite farmers contribute a variety of German, although, like other groups, they use BC in daily communication. Although Afro-Belizean speakers of BC constituted the majority ethnic group prior to 1990, the demographic distribution has changed due to the surge in Spanish speakers (Table 1).

Table 2 shows the distribution of ethnic groups and languages in the six Belizean districts. The Creole population resides primarily in the Belize District that includes the main town (Belize-City), but also in the districts of Cayo (including Belmopan, the administrative capital), and of Toledo. The Mestizo population is highest in the Corozal, Orange Walk, and Cayo districts, and spreading to other areas.

Although BC and Spanish are the two dominant languages, bilingualism is not widespread. Many Creoles speak only BC, and many Mestizos only Spanish. By contrast, Garifuna is receding, as its younger speakers favor BC. Mayan varieties appear to survive in rural areas. Aspects of BC are documented in Escure (1997, 2004b), and LePage and Tabouret-Keller (1985). Garifuna is a particularly interesting mixed language that comprises Arawak, Carib, French, English, and Spanish components.

As is the case everywhere in Central America, a large segment of the Belizean population has emigrated abroad, mostly to the United States (Greene, 1999). This is reflected in the fact that 65% of the Belizean population is under the age of 24.

Bell, Alexander Graham (1847–1922)

M K C MacMahon, University of Glasgow, Glasgow, UK

© 2006 Elsevier Ltd. All rights reserved.

Alexander Graham Bell achieved international prominence on two counts: the first successfully patented invention of the telephone and a methodology for teaching speech to the deaf based on his father's system of 'Visible Speech.'

Bell was born in Edinburgh, Scotland on March 3, 1847, one of the sons of Alexander Melville Bell. He studied briefly at the Universities of Edinburgh and London, without taking a degree. Like his father, he practiced, for a brief period, as an elocutionist and speech therapist in London. In 1863, he and his father were given a demonstration by Sir Charles Wheatstone of Wolfgang von Kempelen's (*see* **Kempelen, Wolfgang von (1734–1804)**) 'speaking machine'; Graham Bell later constructed his own version. His attention then turned to the question of resonances of vowel sounds, a subject that was later to appear in printed form (1879). Contact with A. J. Ellis (*see* **Ellis, Alexander John (né Sharpe) (1814–1890)**) introduced him to the work of Hermann von Helmholtz, whose synthesis of vowel sounds by means of electromagnetically driven tuning forks had some bearing on the development of Bell's ideas about telegraphy and telephony.

His emigration to the United States in 1870 led to contacts in Boston with important U.S. scientists and technicians, and he began work on a harmonic multiple telegraph. In the course of this, during 1875–1876, he gradually came to see the possibility of transmitting sound electrically by means of a diaphragm that induced electrical vibrations in a neighboring magnetic coil, and thus the telephone was born. His initial device transmitted speech with relatively poor quality; Thomas Edison's design, in 1878, of a carbon transmitter produced considerable improvements. The commercial exploitation of the telephone secured for Bell considerable personal wealth, a good portion of which he distributed to educational institutions.

His wife, Mabel Hubbard, had been totally deaf since the age of five. Bell was to teach her to speak again, using the principles of articulatory phonetics in Alexander Melville Bell's book *Visible speech*. The success achieved by this method for numerous deaf children and adults led to the founding of various schools for the deaf in North America and Europe, where the Visible Speech method was employed fairly successfully.

Bell's scientific interests extended to genetics (of deaf persons), aviation, and hydrofoils. He was President of the National Geographic Society, and received, in the United States, Scotland, and Germany, various academic and civil awards.

Bell used his considerable intellectual, administrative, and personal qualities in the service of the deaf. Almost all of his publications focus on one or more aspects of how the deaf can be helped, linguistically and educationally, to a better style of life. His *Mechanism of speech* (1906 and later editions) is the text of lectures he gave on phonetics and the audio–lingual education of the deaf, to which he added his paper from 1879 on vowel theories. He died at his home, Beinn Breagh in Nova Scotia, Canada on August 2, 1922.

Various members of the same Bell family in the 19th century were associated with the study of 'vocal physiology.' Bell's father, Alexander, practiced in Edinburgh and London as an elocutionist and speech therapist; his brother David Charles did the same in Dublin; one of his sons, Alexander Graham (*see* **Bell, Alexander Graham (1847–1922)**) achieved equal, if not greater, prominence in this field, especially with the deaf, in the United States.

Melville Bell was born in Edinburgh on March 1, 1819 and worked in that city from 1843 to 1865, thereafter in London (1865–1870). Deaths and illness in the family prompted the decision to give up the important position he had achieved as an applied phonetician and to move to Ontario, Canada, where he was able to continue and develop his work (1870–1881). Between 1881 and 1905, he lived and worked in Washington, DC, near his son Alexander Graham Bell. He died there on August 7, 1905.

'Vocal physiology' encompassed descriptive articulatory phonetics, elocution (particularly public speaking), speech therapy, and the audiolingual education of the deaf and hard-of-hearing. Bell's central publication in this area was *Visible speech: The science of universal alphabetics* (1867), the result of nearly 20 years of preparatory work. It expounds a general phonetic theory covering phonation, articulation, and voice qualities, with examples drawn from several languages and dialects of English. An iconic notation, logically constructed, is capable of reflecting many nuances of conversation (including nonspeech sounds). Bell envisaged several practical applications of Visible Speech, including the study of dialects, foreign languages, speech therapy, and the treatment of the deaf and dumb. He further proposed that with embossed versions of each symbol, a blind person could be taught to read. A numerically coded version of each symbol was suggested so that speech might easily be telegraphed and, when received, decoded (i.e., pronounced) by a trained user of the system.

Bell published extensively on the principles of Visible Speech, with numerous illustrative textbooks (e.g., 1892). His *World-English* (1888), however, is a reformed spelling system for English, based mainly on roman, not iconic, letters.

Bell's achievement was to draw on the insights of earlier phoneticians and elocutionists (from the 17th and 18th centuries) as well as of his contemporaries in order to formulate the first thorough statement of general phonetic principles. In addition, he demonstrated the many areas in which a practical knowledge of phonetics could be used successfully.

Bello, Andrés (1781–1865)

G Haßler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd. All rights reserved.

Andrés Bello was born in Caracas, on November 29, 1781, and died in Santiago de Chile on October 15, 1865. His parents were Bartolomé Bello and Ana Antonia López. He was a Venezuelan poet, educator, and scholar. His poetry is known for its classical style, celebrating the natural beauty and country life of South America. Bello's life was led in three settings: (1) in Caracas (1781–1810) at the end of the 18th and the beginning of the 19th century, one of the most scholarly and culturally developed cities of South America, (2) in London (1810–1829), which was emerging as the capital of a new global empire, and (3) in Chile (1829–1865), where Bello realized most of his fruitful plans.

Bello was educated at the University of Venezuela, where he studied arts, law, and medicine. He began his professional life as a private tutor and wrote prose and poetry. His interest in linguistic problems dates from these early years. Back then he wrote, for example, a first version of his *Análisis Ideológico de los Tiempos de la Conjugación Castellana*, published later in 1841. In 1810 he went, with Simon Bolívar, to London, England, where he served as a secretary to the legations of Colombia and Chile and wrote his famous two-part epic poem, *Silvas Americanas* (American Woods, 1826–1827). After the declaration of independence of Venezuela, Bello continued working for the new government, but following the reconquest by the Spaniards he remained in London without a representational mission, homeland and work. He earned his living by giving French and Spanish lessons and teaching the sons of William Richard Hamilton. He married in England, and after the death of his first wife he took in matrimony Elizabeth Antonia Dunn who accompanied him to Chile and had 13 children with him.

In 1829 Bello returned to South America to accept a post in the Chilean government (Senator, 1837–1855), and in 1843 he became the first rector of the University of Chile. He became a secretary of the Ministerio de Negocios Extranjeros (Foreign Trade Ministry) and an editor of the national newspaper *El Araucano*. Bello was one of the most active collaborators in the reform of the legal system in Chile. He drafted the *Código civil para la república de Chile* (1842), which was passed in 1855. Bello was elected to the Real Academia Española.

Of Bello's many works, the most important are *Principios de derecho internacional* (Principles of international jurisprudence, 1832), a standard textbook on international law, and *Gramática de la lengua castellana para uso de hispano-americanos* (Grammar of the Castilian language for use by Latin Americans, 1847). *Gramática de la lengua castellana para uso de hispano-americanos* was the first scientific study of Spanish; with this work, Bello was the first to propose a single linguistic standard for all of Latin America.

Bello contributed to almost every field of linguistics: the syntax of contemporary Spanish, verb morphology, the history of the Spanish language, metrics, prosody, phonetics, and orthography. In the latter, he favored the successive adaptation of orthography to pronunciation. His contribution to verb morphology consists in an analysis of tenses that uses a new terminology, not depending on the tradition of Latin grammar.

During his sojourn in Europe Bello became acquainted with several contemporary linguistic theories and integrated them into his doctrine. He adopted the analytical method from the French Idéologues and used the ideas of English empiricism. He was very familiar with the tradition of Spanish grammar and incorporated it into his theoretical system in accordance with the present usage of language.

Adhering to a previously defined theoretical model, Bello's *Gramática* displays an internal coherence and includes one of the most detailed descriptions of refined standard Spanish. He denied the suitability of Latin grammatical categories for the description of Spanish and proposed a system of verbal categories exclusively defined by their syntactic functions. The impact of his work led to many condensed versions and adaptations. Bello's theory was largely disseminated in the Hispanic world, and his ideas appeared in almost every Spanish grammar after 1847.

The conservation of the Spanish language as 'a wonderful means of communication' among the peoples of America was one of Bello's most important preoccupations. He was afraid of a recurrence of the confusion of languages that had taken place in Europe in the Middle Ages. His grammar also served the purpose of normalization and prescription of linguistic norms.

Belorussian

S Young, University of Maryland Baltimore County, Baltimore, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Belorussian (*belaruskaja mova*; Belarusian, Belarusan), which together with Ukrainian and Russian forms the East Slavic branch of the Slavic languages, is the native language of some 8 million speakers in the Republic of Belarus. The standard language is based on the central dialect of the Minsk region. In an earlier form known as Old Belorussian, West Russian, or among contemporaries simply as *rus'skij*, Belorussian served from the 15th through the late 17th centuries (when it finally yielded to Polish) as the chancery language of the multiethnic Grand Duchy of Lithuania (which in 1569 became part of the Polish Commonwealth). Thereafter, with political bans on publication in the language, Belorussian went into a period of decline. It was not until the first decades of the 20th century that Belorussian experienced a revival, with roots not in the distant literary traditions of the Grand Duchy, but in the vernacular of the countryside. The first legal Belorussian periodical, *Naša Niva* '*Our Cornfield*' (1906–1915), attracted contributions from leading intellectuals of the day and did much to promote structural and orthographic uniformity in the language. The first attempt at a normative grammar of the language was Branislaŭ Taraškevič's *Belaruskaja hramatyka dlja škol* '*Belorussian grammar for schools*' (1918). The consolidation of grammatical norms continued well into the 20th century.

Belorussian, which is written in the Cyrillic alphabet, shares a number of phonological features with both Russian and Ukrainian. As in standard Russian, unstressed *o* is pronounced *a* (*ákanne)*, and (as in certain Russian dialects) unstressed *e* becomes *'a* (*jákanne*). Unlike Russian, these features are reflected in the orthography (in the case of *jákanne*, only in pretonic position), which is set up on the phonemic, rather than morphophonemic, principle: *nažý* 'knives' (sg. *nož*) and *zjamljá* 'world' (pl. *zémli*). Most consonants occur in phonemically opposed palatalized–nonpalatalized pairs. East Slavic t^j and d^j have assibilated to $t\underset{\smile}{s}^j$ and $d\underset{\smile}{z}^j$: *dzéci* [ˈd$\underset{\smile}{z}$^{j}et$\underset{\smile}{s}$^{j}i] 'children' (Rus. *déti* [ˈd^{j}et^{j}i]); palatalized r^j has been lost: *rad* 'row' (Rus. *rjad*). As in Ukrainian, the palatal affricates *č* and *šč* are pronounced hard, East Slavic *g* is a fricative [ɣ], and *v* becomes [w] (in transcription from Cyrillic, *ŭ*) in closed syllables: *halóŭka* 'head, dim.' (*halavá* 'head').

Morphological characteristics of the noun include the loss of a distinct neuter plural: *aknó* 'window' (pl. *vókny*; Rus. *oknó*, *ókna*); the alternation of stem-final velars and dental affricates in certain case forms: nom. sg. *ruká* 'hand' (dat. sg. *rucé*); and a tendency toward the spread of the first declension genitive plural marker *-oŭ* (unstressed *-aŭ*) to other declensions: *zímaŭ* (Rus. *zim*) 'of winters'.

The verb has two regular conjugation patterns, illustrated in the present tense by *nésci* 'to carry' (I) and *rabíc'* 'to do, make' (II): 1SG *njasú*, *rabljú*; 2SG *njaséš*, *róbiš*; 3SG *njasé*, *róbic'*; 1PL *nesëm*, *róbim*; 2PL *nesjacé*, *róbice*; 3PL *njasúc'*, *róbjac'*. Like Ukrainian, but unlike Russian, the third-person ending (lacking in the singular of pattern I) is palatalized. As in Ukrainian, there is a change of the masculine past tense marker *l* to *w*: *znaŭ* masc.'knew' (fem. *znála*).

To a greater extent than in Ukrainian, the lexicon reflects the historical influence of Polish, chiefly from the period of the Polish-Lithuanian Commonwealth. Since the late 18th century unification with Russia, the influence of Russian has prevailed.

Ben Yehuda, Eliezer (1858–1922)*

R Sivan

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 326–327, © 1994, Elsevier Ltd.

Popularly known as 'the father of Hebrew speech' or 'the reviver of the Hebrew language' Ben Yehuda coined hundreds of new words in Hebrew, most of which are accepted and used today in speaking and in writing. He composed a monumental 16-volume Hebrew dictionary *Thesaurus Totius Hebraitatis* and an additional introductory volume *Prolegomena*.

He came to Ottoman Palestine from Russia with the first wave of modern Jewish pioneers beginning a new period in Jewish history, that of Zionism, having changed his foreign family name of Perlman to the Hebrew name Ben Yehuda. Immediately upon docking in Jaffa, and after kissing the soil of the Holy Land, both Ben Yehuda and his wife swore that from then on they would speak only Hebrew between themselves. From Jaffa they went directly by horse-drawn wagon to Jerusalem.

Ben Yehuda lived in Jerusalem for some 40 years, fulfilling the decision he had publicly proclaimed:

> To revive Hebrew speech, to return to the language of our forefathers, the language we did not use in speech while in exile, to revive it in our mouths and to speak it . . . Just as the Jews cannot truly be a nation unless they return to the land of their forefathers, they cannot truly be a nation unless they return to the *language* of their forefathers and use it, not only in writing on holy or intellectual matters but also, and especially, in speaking, young and old . . . on all matters of living . . . like all the nations, each nation in its national tongue.

Thus were fused together the movement to revive Hebrew-speaking and the nascent Zionist national movement.

Hebrew began to return to life in speech among the small Jewish community in the country composed of the old Jewish settlements (the *Yishuv*) plus the Diaspora Jews who came from exile, speaking Yiddish, Ladino, Arabic, Russian, German, etc. Together with a small band of lovers of Hebrew and scholars of the language, teachers, and writers, Ben Yehuda encouraged the spread of Hebrew speaking, helped in setting up Hebrew schools and kindergartens, searched Hebrew sources (e.g., the Bible, Talmudic literature, later literature, the Prayer Book) for words for daily needs, and created new words. Ben Yehuda also helped found The Hebrew Language Council in 1889, and served as its first president until his death in 1922. The Council also functioned in the British Mandate period 1918–1948, and with the establishment of the State of Israel became the Academy of the Hebrew Language in 1953.

Ben Yehuda created approximately 225 Hebrew words for his *Thesaurus*. He noted them with the sign ∽. About 70 percent of them were absorbed and accepted into the language, and they are still used in the 1990s in speaking and in writing. The words filled a need in the reviving language. They were not words on 'weighty, high, or abstract matters,' as Ben Yehuda notes, 'but for matters most ordinary, for use in everyday life.' These words spread also to the books and periodicals published in Hebrew, in Israel and abroad, in the 1880s and 1890s and the early decades of the 20th century.

Some examples of Ben Yehuda's neologisms are

1. Nouns: *maxlava* (dairy), *zehut* (identity), *mapuxit* (harmonica), *maxlec* (corkscrew), *vaada* (committee), *xavita* (omelette), *aviron* (airplane), *mitriya* (umbrella), *ofna* (fashion), *yozma* (initiative).
2. Adjectives: *kiconi* (extreme), *akiv* (consistent).
3. Participial forms: *moomad* (candidate).
4. Verbs (cited in 3rd MASC sg pt form): *ixel* (wish for), *higer* (immigrate, emigrate – from Arabic), *hitgander* (dress up, show off), *zimzem* (hum).

*translated from the Hebrew by J Fellman.

Ben Yehuda created approximately 225 Hebrew words for his *Thesaurus*. He noted them with the sign ∽. About 70 percent of them were absorbed and accepted into the language, and they are still used in the 1990s in speaking and in writing. The words filled a need in the reviving language. They were not words on 'weighty, high, or abstract matters,' as Ben Yehuda notes, 'but for matters most ordinary, for use in everyday life.' These words spread also to the books and periodicals published in Hebrew, in Israel and abroad, in the 1880s and 1890s and the early decades of the 20th century.

Some examples of Ben Yehuda's neologisms are

1. Nouns: *maxlava* (dairy), *zehut* (identity), *mapuxit* (harmonica), *maxlec* (corkscrew), *vaada* (committee), *xavita* (omelette), *aviron* (airplane), *mitriya* (umbrella), *ofna* (fashion), *yozma* (initiative).
2. Adjectives: *kiconi* (extreme), *akiv* (consistent).
3. Participial forms: *moomad* (candidate).
4. Verbs (cited in 3rd MASC sg pt form): *ixel* (wish for), *higer* (immigrate, emigrate – from Arabic), *hitgander* (dress up, show off), *zimzem* (hum).

*translated from the Hebrew by J Fellman.

Ben Yehuda conceived the idea of a dictionary while still a medical student in Paris, some two years before coming to Palestine. The aim of the dictionary, according to him, was to help realize the idea of the revival of Hebrew in speech. The task of composing it he took upon himself, even though he was not prepared scientifically for it, and could not appreciate the magnitude and scope and the difficulties involved in a work which would preoccupy him until the very last day of his life. The printing would only be completed 37 years after his death, when the Hebrew whose revival he had pioneered was already a robust, thriving language both in speech and in the media, and was in literary and journalistic use. When he realized that the dictionary would take a very long time he published a small Hebrew–Yiddish–Russian dictionary (Warsaw, 1901), with the collaboration of Joshua Steinberg. Later, in 1912, he published a slightly fuller and more complete version.

Preoccupation with the dictionary made Ben Yehuda ultimately a widely read and deeply learned linguist. He learned Aramaic dialects and Arabic, especially the Judeo–Arabic form written in Hebrew letters and used in the works of the medieval Jewish scholars.

The 16 volumes of the *Thesaurus Totius Hebraitatis*, plus the *Prolegomena* were published over a 50-year period (1909–1959), and contain some 8300 pages. The first five volumes were published during Ben Yehuda's lifetime. Volumes 6 and 7 were ready for printing, and were edited by W. F. Albright, Y. N. Epstein, M. Y. Margalit, and assistants. Volumes 8 and 9 were completed by M. Z. Segal, aided by Y. Knaani. The remaining volumes (10–16) and the *Prolegomena* were edited by N. H. Tur-Sinai, with the assistance of M. Medan, D. Yarden, and (for volumes 14–16) D. Peles, Y. Mansour, and Y. Ben David.

Benfey, Theodor (1809–1881)

R Schmitt, Laboe, Germany

© 2006 Elsevier Ltd. All rights reserved.

Theodor Benfey, the famous Göttingen Indologist and comparatist, was born in Nörten (near Göttingen) on January 28, 1809. After philological studies, he obtained his doctorate in 1828 and became a lecturer (Privatdozent) in the following year at Göttingen University. In 1834 he took up lecturing and finally was appointed extraordinary professor there in 1848 and full professor of Sanskrit and comparative philology in 1864, at a time when he had already become member of several academies of sciences. He was not only a successful university teacher but also a quite fertile scholar in the fields of Indology and Indo-European studies. He died on June 26, 1881, in Göttingen.

Turning from classical studies to comparative grammar, he introduced himself with the *Griechisches Wurzellexikon* (two volumes, 1839 and 1842), one of the first and fundamental treatises on etymology in a scientific sense. As an autodidact, he learned Sanskrit and the Vedic language. In 1840 he summarized the knowledge thus far of the entire field of Old Indian culture in a massive encyclopedic article. In 1848 he translated the hymns of the *Sāmaveda* (1848) and published them in a book, a masterpiece (and by Benfey's own estimation his most inventive book) for a number of reasons, not least because of the glossary he had added, the first ever of a Vedic text. Then he devoted himself to the Sanskrit language itself. He wrote, in succession to Pāṇini, a comprehensive manual of Sanskrit grammar, *Handbuch der Sanskritsprache* (two volumes, 1852 and 1854), that contained both a complete grammar and an anthology with glossary. Later, he compiled *A Sanskrit-English dictionary* (1866).

In many studies, both short and long, he dealt with a variety of Indo-European linguistic problems, among them the origin of the optative mood or the vocative case, and the several endings of nominal or verbal forms. Of special importance is his series of articles about Vedic grammatical problems; Benfey had intended this as preliminary work for a Vedic grammar, but he unfortunately was not able to finish it. The most important of those studies have been republished in various volumes: *Vedica und Verwandtes* (1877), *Vedica und Linguistica* (1880), and *Kleinere Schriften*, edited by A. Bezzenberger (two volumes, 1890 and 1892).

Before he concentrated resolutely on Indo-Aryan and Indo-European topics, he had done other work (e.g., on the Old Persian inscriptions) and even tried to prove a relationship between Egyptian and the Semitic languages, in *Über das Verhältnis der*

Bengali

H-R Thompson, School of Oriental and African Studies, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Bengali is the official language of Bangladesh and of the state of West Bengal in India. There is some controversy about the correct name of the language. The term 'Bangla' is increasingly in use, particularly among Indian linguists, for whom the term 'Bengali' may be associated with British India. It is likely that in the not-too-distant future 'Bangla' will replace 'Bengali.' With a total number of about 260 million speakers, Bengali is the world's fifth largest language.

Bengali, together with Assamese and Oriya, belongs to the eastern branch of Indo–Aryan languages. A high percentage of vocabulary is derived from Sanskrit, with lesser influences from Persian, Arabic, and English. Bengali has a very large vocabulary but the language situation is diglossic. The vocabulary used in spoken language is distinct from the highly Sanskritized words used in some literature and formal contexts. Many words have both a Sanskritic and a colloquial version, e.g., হস্ত, /hɔsto/, হাত /hat/ 'hand,' চন্দ্র /cɔndro/, চাঁদ /cãd/ 'moon,' দন্ত /dɔnto/, and দাঁত /dãt/ 'tooth.' The early 20th-century rivalry between the *sadhu bhasha* (literary language) and *calit bhasha* (colloquial language) is now a thing of the past. Standard Colloquial Bengali, based on the language spoken in Kolkata, is the accepted norm. Some Bengali dialects retain the *sadhu* extended verb forms, e.g., আমি যাইতেছি /ami yaitechi/) rather than the contracted calit form (আমি যাচ্ছি /ami yacchi/ for 'I am going.'

Dialects vary in phonological and grammatical deviation. Sylheti, the dialect spoken by most Bangladeshis living in the United Kingdom, has a high percentage of Persian words and is considered by some to be a separate language.

Orthography and Phonology

Bengali is written in a variant of the Devanagari script, which is related to but distinct from the script used for Sanskrit and Hindi. Writing is from left to right and is syllabic. There are 12 vowels or diphthongs, two semivowels, and almost 40 consonants. Bengali has a great number of conjunct letters that combine, in one symbol, two or more consonants or consonant–vowel clusters. Vowel signs are attached to consonants except at the beginning of words and syllables, where the full vowel is written.

A high percentage of vocabulary is derived from Sanskrit, with lesser influences from Persian, Arabic, and English. Bengali has a very large vocabulary but the language situation is diglossic. The vocabulary used in spoken language is distinct from the highly Sanskritized words used in some literature and formal contexts. Many words have both a Sanskritic and a colloquial version, e.g., হস্ত, /hɔsto/, হাত /hat/ 'hand,' চন্দ্র /cɔndro/, চাঁদ /cãd/ 'moon,' দন্ত /dɔnto/, and দাঁত /dãt/ 'tooth.' The early 20th-century rivalry between the *sadhu bhasha* (literary language) and *calit bhasha* (colloquial language) is now a thing of the past. Standard Colloquial Bengali, based on the language spoken in Kolkata, is the accepted norm. Some Bengali dialects retain the *sadhu* extended verb forms, e.g., আমি যাইতেছি /ami yaitechi/) rather than the contracted calit form (আমি যাচ্ছি /ami yacchi/ for 'I am going.'

Dialects vary in phonological and grammatical deviation. Sylheti, the dialect spoken by most Bangladeshis living in the United Kingdom, has a high percentage of Persian words and is considered by some to be a separate language.

Orthography and Phonology

Bengali is written in a variant of the Devanagari script, which is related to but distinct from the script used for Sanskrit and Hindi. Writing is from left to right and is syllabic. There are 12 vowels or diphthongs, two semivowels, and almost 40 consonants. Bengali has a great number of conjunct letters that combine, in one symbol, two or more consonants or consonant–vowel clusters. Vowel signs are attached to consonants except at the beginning of words and syllables, where the full vowel is written.

An inherent vowel (pronounced /ɔ/ or /o/) is often pronounced when no other vowel is given.

Bengali, like other South Asian languages, distinguishes between aspirated/unaspirated and dental/palatal sounds. Nasalization occurs in individual words and is phonemic (কাদা /kada/ 'mud,' কাঁদা /kāda/ 'weep,' বাধা /badha/ 'obstruction,' বাঁধা /bādha/ 'bind') and in the distinction between ordinary and honorific personal pronouns, as in ওর /or/ 'his/her' (familiar) and ওঁর /õr/ 'his/her' (honorific). Bengali spelling retains some Sanskrit features, but its pronunciation has evolved and changed. The word for 'soul,' though it is spelled আত্মা /atma/, is pronounced /atta/. The Sanskrit word for heaven 'swarga' becomes স্বর্গ, pronounced /sɔrgo/. The distinction between long and short u and i, which is present in the script, is no longer felt in pronunciation. Long /o/ can be represented by the vowel sign or by the inherent vowel. There are three symbols for the sound /ng/: ং, ঙ, and the conjunct ঙ্গ. Their uses are to some extent interchangeable, but ং is never followed by a vowel, thus we have বাংলা /bangla/ (the name for the language), but বাঙালি /bangali/ (the adjective and name for the people). There are three sibilants in Bengali স /s/, শ /ʃ/, and ষ /ṣ/. Their pronunciation is /sh/, except in some conjuncts, in which it changes to /s/, e.g., বিশ্রাম /biʃram/ 'rest,' স্থান /sthan/ 'place,' and নাস্তা /nasta/ 'breakfast.'

Morphology and Syntax

Basic word order is subject–object–verb, but sentence parts can move freely to express emphasis. Bengali has a complex relative–correlative system – i.e., subordinating conjunctions such as যখন /yokhon/ 'when' and যদি /yodi/ 'if' almost invariably have a correlative conjunction in the main clause. Subordinate clauses generally precede main clauses.

Nouns have no grammatical gender. There are four cases, nominative, genitive, object, and locative. The **nominative** is unmarked. Number and definiteness is marked by determiners that are suffixed to nouns, but their use is partly defined by the context. Plural markers for animate and inanimate nouns are distinct from one another. All case endings are added after these suffixes, e.g., মেয়ে /meye/ 'girl,' মেয়েটি /meye-ṭi/ 'the girl,' and মেয়েটিকে /meye-ṭi-ke/ 'to the girl.'

In the **genitive** nouns, add র /r/ or এর /er/: বাবা /baba/ 'father,' বাবার /baba-r/ 'father's,' উকিল /ukil/ 'lawyer,' and উকিলের /ukil-er/ 'the lawyer's.' The genitive has a wide variety of uses, including possession (রিমার ভাই /rima-r bhai/ 'Rima's brother'), attribute (প্রেমের গল্প /præm-er gɔlpo/ 'love story'), function (বসার ঘর /bɔsa-r ghɔr/ 'sitting room'), measurement (দুই ঘণ্টার ছবি /dui ghɔnṭa-r chobi/ 'a film lasting two hours'), and cause or origin (সমস্যার সমাধান /sɔmossha-r sɔmadhan/ 'solution to the problem'). The genitive usually functions as the logical subject in impersonal structures.

The **object case** is marked by কে /ke/: from (বাবা /baba/ 'father' বাবা-কে /baba-ke/ 'to father'). The case ending is used to mark direct or indirect objects. The case marking is usually omitted for inanimate nouns, but can be added for emphasis or to avoid ambiguity.

The **locative** ending is এ /e/ after consonants: সহর /sɔhor/ 'town' সহরে /sɔhor-e/ 'in the town'; য় /y/ after আ /a/ (ঢাকা /ḍhaka/ ঢাকায় /ḍhaka-y/ 'in ḍhaka,' and তে /te/ after all other vowels: বালু /balu/ বালুতে /balu-te/ 'in the sand.' The locative is used to indicate place: বাড়িতে /baṛi-te/ 'at home,' direction: ঘরে /ghɔr-e/ 'into the house,' time: দশটায় /dɔʃṭa-y/ 'at ten o'clock,' cause: তার বলায় /tar bɔla-y/ 'because of what he said,' instrument: হাতুড়িতে /hatuṛi-te/ 'with a hammer,' or origin: চেষ্টায় /ceṣṭa-y/ 'from/through trying.' The locative is rarely used with animate nouns.

Bengali has personal, demonstrative, relative, interrogative, and indefinite **pronouns**. Personal pronouns distinguish three grades of familiarity in the second person and two grades of respect in the third person. They distinguish singular and plural, but not gender. There is a three-way deictic distinction (*here, there*, and *removed from context*) that applies to third-person pronouns, attributive adjectives, demonstratives, and place adverbials, for instance, এ মেয়ে /e meye/ 'this girl,' ও মেয়ে /o meye/ 'that girl (over there),' সে মেয়ে /se meye/ 'that girl, (removed from context),' এখানে /ekhane/ 'here,' ওখানে /okhane/ 'there,' and সেখানে /sekhane/ 'in that place.'

Adjectives precede nouns and are indeclineable. For comparisons, auxiliary words are used:

(1) আমার ভাই আমার চেয়ে লম্বা।
/amar bhai amar ceye lɔmba/
my brother my than long
'My brother is taller than me.'

(2) এই গাছ সবচেয়ে সুন্দর।
/ei gach sɔbceye sundor/
this tree all than beautiful
'This is the most beautiful tree.'

Postpositions are, with a few exceptions, noun forms: about my parents: *on the subject of my parents*; or verbal participles: with the hammer: *having taken the hammer.*

Verb conjugation is very regular. Verb endings are the same for singular and plural. Some active verbs can be extended to form causative verbs, e.g., জানা /jana/ 'know' becomes জানানো /janano/ 'inform'; দেখা /dækha/ 'see' becomes দেখানো /dækhano/ 'show'). There are, morphologically, eight tenses. Present and past tense have simple and progressive aspect. Perfect tenses (present and past) can express

not only perfective aspect but are also used to refer to past events or actions directly. The past habitual is used for remote past events and for subjunctive uses. The future tense forms the after-state of all other tenses. Tense use is much freer than in English – in fact, narrative texts gain color and liveliness through frequent tense changes.

Every verb has four **nonfinite verb forms**: infinitive, verbal noun, conditional, and perfective participle. Conditional and perfective participles, in particular, offer in very concise forms a great range of meanings. The conditional participle is formed by adding লে /le/ to the stem of the verb: থাকলে /thakle/ from থাক- /thak-/ 'stay.' It can be used temporally as well as conditionally and its temporal structure is determined by the main clause, thus a phrase such as সে থাকলে /se thakle/ has a range of meaning, from 'when he is here' to 'if he were alive.' The perfective participle, formed by adding এ /e/ to the verb stem, describes in its basic use a preceding action (e.g., খবরটা শুনে সে বাইরে গেল। /khɔborṭa ʃune se baire gælo/ 'having heard the news he went out'), but it can also take on causal meaning, can describe simultaneous actions, or can be used to change an adjective into an adverb (e.g., ভাল /bhalo/ 'good' becomes ভাল করে /bhalo kore/ 'well'). It is not unusual to have a number of perfective participles in one sentence to describe consecutive events. Perfective participles are also used in the formation of compound verbs, in which two verbs combine to take on a new meaning. The second verb can lose its original meaning entirely and instead add an aspectual feature to the perfective participle, as in খাওয়া /khaoy̆a/ *eat*, খেয়ে ফেলা /khey̆e phæla/ (lit: having eaten, throw = 'eat up') and আসা /asa/ 'come,' এসে পড়া /ese pɔṛa/ (lit: having come, fall = 'arrive'). To some extent, nonfinite verb forms take over the role of subordinate clauses.

Impersonal structures are very common, as, for instance, in expressing possession, possibility, obligation, and physical sensations, feelings, and experiences (examples (3)–(6), respectively):

(3) আমার গাড়ি আছে।
/amar gaṛi ache/
my car be.3.PERS PRES
'I have a car.'

(4) এখানে যাওয়া যায়।
/ekhane yaoy̆a yay/
there go.VN go.3.PERS PRES
'It is possible to go there.'

(5) তাকে যেতে হবে।
/take yete hɔbe/
him.ACC go.INF be.3.PERS FUT
'He will have to go.'

(6) আমার ভয় লাগে।
/amar bhɔy̆ lage/
my fear attach.3.PERS PRES
'I am afraid.'

The logical subject is usually in the genitive.

Passives are formed with verbal nouns and the verb হওয়া /hɔoya/ 'be, become'; for example, সে আমাকে টাকা দিয়েছে। /se amake ṭaka diy̆eche/ 'he has given me money' becomes as shown in example (7):

(7) আমাকে টাকা দেওয়া হয়েছে।
/amake ṭaka deoy̆a hoy̆eche/
me. ACC money give.VN be.3.PERS PRF
'The money has been given to me.'

Intransitive verbs can also be used in passive structures; for example, আমি যাবো। /ami yabo/ 'I will go' becomes as shown in example (8):

(8) আমার যাওয়া হবে।
/amar yay̆oa hɔbe/
my go.VN be.3.PERS FUT
'My going will be.'

Special Features

If languages can be said to have particular characteristics, then Bengali has a sense of play in its phonetic structure. We find it in numerous onomatopoeia, such as চকচক /cɔkcɔk/ 'glittering,' টিপটিপ /ṭipṭip/ 'dripping' (water), ঘোঁত ঘোঁত /ghõtghõt/ 'grunting,' খিলখিল /khilkhil/ 'giggling,' and ধু-ধু /dhu-dhu/ (expressing 'desolation'), but also in sequences of similar or identical syllables to express mutual or extended actions, as in হাসাহাসি /hasahasi/ 'laughing,' মারামারি /maramari/ 'fighting,' ঠেলাঠেলি /ṭhælaṭheli/ 'jostling,' বকাবকি /bɔkaboki/ 'bickering,' লেখালেখি /lækhalekhi/ 'correspondence,' and কান্নাকাটি /kannakaṭi/ 'continuous weeping.' Reduplication of adjectives and adverbs has an intensifying effect, as in বড় বড় /bɔṛo bɔṛo/ 'big big'-'very big,' দূরে দূরে /dure dure/ 'far far' = 'a long way away,' and সকাল সকাল /sɔkal sɔkal/ 'morning morning'-'very early.' Many of these combinations have an element of improvisation and greatly add to the charm of the language.

Benin: Language Situation

E Aboh, University of Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Benin, a former French colony, became independent in 1962 and was known as Dahomey until 1975, when this name changed. Some have described this country as a fist emerging from the West African coast or a bottle that is planted there upside down. This small country of about 11 570 sq km is sandwiched between Togo to the west, Nigeria to the east and northeast, Burkina Faso to the northwest, and Niger to the north. The population is estimated at about 6.7 million people, with the majority living in the south.

As is often the case in West Africa, the population in Benin has emerged from successive migrations of numerous ethnic groups that settled there at various points of the history. The major ethnic groups include the Yoruba (Nago) and the Fon in the south and the Dendi, the Bariba, the Fulbe, and the Somba in the North.

This mosaic of ethnic groups reflects the number of languages (or dialects) spoken in Benin. The 1990 *Atlas sociolinguistique du Bénin* includes 57 languages and/or dialects that fall into the following different language families:

- Niger-Congo: Kwa, e.g., Yoruba, Fon (Fon-Gbe), Chokosi (Anufo), Basa; Gur, e.g., Ditammari, Baatonu (Bariba), Waama; Senegambian, e.g., Fulfulde, Fulbe-Borgu; and Mande, e.g., Boko
- Nilo-Saharan: Songhai, e.g., Dendi, Zarma
- Afro-Asiatic: Chadic, e.g., Hausa.

In such a multilingual situation, it is common practice in Africa to select the language of the former colonial state – in Benin, French – as the official language to be used in formal contexts (e.g., education, government), while other languages are restricted to informal contexts and certain mass media communications (e.g., vaccination campaigns). The need for such a dual system is stated in the 1990 constitution, which declared that each community has the right to its own language(s) and should be guaranteed the right to develop its own culture. Similarly, the constitution states that the government must promote native languages for intercommunity communication. In this regard, a law was passed in 1997 that opened up broadcasting space to private companies. This triggered the development of local and rural broadcasting corporations that use primarily native languages. This development significantly promoted the use of native languages in both informal and certain formal contexts. For instance, it is now common practice for politicians to address their audience in native languages, or to use slogans written in native languages. This revival of native languages, combined with literacy programs for adults that have been developed since the 1960s, has helped bridge the gap between French and the native languages.

The promotion of native languages, however, should not mask the serious drawbacks of the language policy in Benin. For instance, the exclusive use of French as language of instruction at all levels, that is, from kindergarten to University, severely undermines children's development at school and undercuts sustainable socioeconomic development. Such unbalanced language policy was and remains the challenge for Benin governments.

Benue–Congo Languages

K Williamson

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 330–331, © 1994, Elsevier Ltd.

The Benue–Congo languages form a very large group in Africa and include the well-known Bantu languages. The term 'Benue–Congo' was introduced by Greenberg (1963) to refer to one of the six branches of his Niger–Congo family. Previously, the Bantu languages had been treated as a separate family and the similarity of the other Benue–Congo languages to Bantu had been recognized by referring to them as 'Semi–Bantu' (Johnston, 1919–1922) or 'Bantoid' (e.g., Guthrie, 1948), equivalent to the 'Benue–Cross' of Westermann (1927). Greenberg's innovation was to remove the separate status of Bantu, add it to Westermann's Benue–Cross as a subgroup, and rename the group, using the term 'Congo' to indicate its extension into the Bantu area.

Greenberg's View of Benue–Congo

Greenberg contrasted Benue–Congo with the other five branches of Niger–Congo, though he noted it was particularly close to Kwa. Internally, he subdivided it into Plateau, consisting of seven numbered subgroups; Jukunoid; Cross River, consisting of three numbered subgroups; and Bantoid, containing seven languages or groups, the last of which is Bantu. The term 'Old Benue–Congo' refers to this scenario.

Views of Benue–Congo in the Late Twentieth Century

Bennett and Sterk (1977) noted that lexicostatistics led to some major changes in Greenberg's scenario. In particular, they split Kwa in half and combined the Eastern half with Benue–Congo. The approximate consensus is presented in Bendor-Samuel (1989); Benue–Congo, including the former Eastern Kwa, is now one of the branches of Volta–Congo, which is in its turn a branch of Atlantic–Congo, within Niger–Congo. The term 'New Benue–Congo' refers to this scenario.

Subgrouping of (New) Benue–Congo

Because of the reclassification in the late 1980s and the very large number of languages involved, the subgrouping of New Benue–Congo is in a fluid state. On the basis of lexical innovations, Blench (1989) has suggested a major division between Western Benue–Congo, corresponding to the former Eastern Kwa, and Eastern Benue–Congo, corresponding to Old Benue–Congo. The recognized subgroups are now listed. (Nigerian orthographic conventions used in language names are as follows: ọ [ɔ], ẹ [ɛ], ị [ɪ], ạ [ə], ṣ [ʃ].)

Western Benue–Congo (formerly Eastern Kwa):

(a) Ọkọ (Ogori): a small, little-studied language.
(b) Ukaan–Akpes: two clusters of tiny, barely studied dialects.
(c) Defoid: two clusters of tiny Akokoid (Amgbe) dialects, plus the Yoruboid group, comprising Yoruba, Iṣẹkiri, and Igala.
(d) Edoid: a large number of languages, including Ẹdo (Bini), and Urhobo.

This article is reproduced from the previous edition, volume 1, pp. 330–331, © 1994, Elsevier Ltd.

The Benue–Congo languages form a very large group in Africa and include the well-known Bantu languages. The term 'Benue–Congo' was introduced by Greenberg (1963) to refer to one of the six branches of his Niger–Congo family. Previously, the Bantu languages had been treated as a separate family and the similarity of the other Benue–Congo languages to Bantu had been recognized by referring to them as 'Semi–Bantu' (Johnston, 1919–1922) or 'Bantoid' (e.g., Guthrie, 1948), equivalent to the 'Benue–Cross' of Westermann (1927). Greenberg's innovation was to remove the separate status of Bantu, add it to Westermann's Benue–Cross as a subgroup, and rename the group, using the term 'Congo' to indicate its extension into the Bantu area.

Greenberg's View of Benue–Congo

Greenberg contrasted Benue–Congo with the other five branches of Niger–Congo, though he noted it was particularly close to Kwa. Internally, he subdivided it into Plateau, consisting of seven numbered subgroups; Jukunoid; Cross River, consisting of three numbered subgroups; and Bantoid, containing seven languages or groups, the last of which is Bantu. The term 'Old Benue–Congo' refers to this scenario.

Views of Benue–Congo in the Late Twentieth Century

Bennett and Sterk (1977) noted that lexicostatistics led to some major changes in Greenberg's scenario. In particular, they split Kwa in half and combined the Eastern half with Benue–Congo. The approximate consensus is presented in Bendor-Samuel (1989); Benue–Congo, including the former Eastern Kwa, is now one of the branches of Volta–Congo, which is in its turn a branch of Atlantic–Congo, within Niger–Congo. The term 'New Benue–Congo' refers to this scenario.

Subgrouping of (New) Benue–Congo

Because of the reclassification in the late 1980s and the very large number of languages involved, the subgrouping of New Benue–Congo is in a fluid state. On the basis of lexical innovations, Blench (1989) has suggested a major division between Western Benue–Congo, corresponding to the former Eastern Kwa, and Eastern Benue–Congo, corresponding to Old Benue–Congo. The recognized subgroups are now listed. (Nigerian orthographic conventions used in language names are as follows: ọ [ɔ], ẹ [ɛ], ị [ɪ], ạ [ə], ṣ [ʃ].)

Western Benue–Congo (formerly Eastern Kwa):

(a) Ọkọ (Ogori): a small, little-studied language.
(b) Ukaan–Akpes: two clusters of tiny, barely studied dialects.
(c) Defoid: two clusters of tiny Akokoid (Amgbe) dialects, plus the Yoruboid group, comprising Yoruba, Iṣẹkiri, and Igala.
(d) Edoid: a large number of languages, including Ẹdo (Bini), and Urhobo.

(e) Nupoid (Niger–Kaduna): some seventeen languages including Ebira (Igbirra), Gade, Gbagyi and Gbari (jointly called Gwari), Kakanda, and Nupe.
(f) Idomoid: some nine languages, including Idoma.
(g) Igboid: comprises Ẹkpẹyẹ and a large language cluster centered around Igbo.

Eastern Benue–Congo (Old Benue–Congo):

(h) Kainji: corresponds to Greenberg's Plateau 1; subdivided into Western Kainji, including the Kambari and Bassa groups and the Lela (Dakarkari) language, and Eastern Kainji, including the Northern Jos group of small languages.
(i) Platoid: corresponds to Greenberg's Plateau 2–7 plus Jukunoid; subdivided into Plateau, with five geographical subgroups including many languages, such as Eggon, Che (Rukuba), Berom, Jju (Kaje), and Tyap (Katab); and Benue, containing Tarok and related languages in one group and Jukunoid, including Jukun, in another.
(j) Cross River: subdivided into Bendi, corresponding to Greenberg's Cross River 1 and including Bekwarra and Bokyi; and Delta–Cross, corresponding to Greenberg's Cross River 2 and 3 combined, comprising four subgroups: Upper Cross, including Mbembe and Lokạạ, Lower Cross, including Anaang, Efik, Ibibio, and Obolo; Ogoni (Kegboid), including Kana, Gokana, and Eleme; and Central Delta, including Abuan and Ọgbịa.
(k) Bantoid: subdivided into Northern Bantoid, comprising Mambila with related languages and Samba Daka with related languages; and Southern Bantoid, comprising the Bantu languages, taken in the broad sense, as used by Greenberg, with the addition of Tiv and languages related to it.

Geographical Location

The Benue–Congo language groups are chiefly found in Nigeria, with Yoruboid, Jukunoid, Cross River, and Northern Bantoid extending slightly into neighboring countries and Bantu having expanded dramatically into Central, East, and Southern Africa.

Typological Characteristics of the Group

Benue–Congo languages have Subject–Verb–Object or occasionally Subject–Modal–Verb–Object word order; adverbials are normally sentence-final. A wide variety of serial verb and consecutive verb constructions are found.

The most typical morphological feature is the existence of noun class systems, usually marked by paired singular/plural prefixes or, for mass nouns, by a single prefix. Words that qualify the noun show concording prefixes, and the verb also shows concord with the noun class of its subject. Some languages have developed noun class suffixes in addition to or instead of prefixes. Bantu languages are the most conservative in showing very full noun class systems, but there are few Benue–Congo languages that do not display at least remnants of a former noun class system.

Verbs often take suffixes, 'verbal extensions' or 'extensional suffixes,' which add such meanings as causative, reciprocal, or separative to the meaning of the root.

Most Benue–Congo language groups show typical phonological features of Niger–Congo, such as vowel harmony, labial-velar stops, and tone. The typical root structure is CVCV (where C = Consonant, V = Vowel) in the more conservative languages; others have reduced their roots to CVC or CV. Complex nasal phenomena involving both vowels and consonants are widespread.

Benveniste, Émile (1902–1976)

E Guimarães, Institute of Language Studies–Unicamp, São Paulo Campinas, Brazil

© 2006 Elsevier Ltd. All rights reserved.

Benveniste, a French linguist known for his work on enunciation, was one of Antoine Meillet's principle disciples and succeeded him at the *Collège de France*. His work is composed of two centers of interest: the analyses of languages and general linguistics. His historical analyses are fundamentally dedicated to the Indo-European (and to the Indo-European languages). The synchronic analyses are generally on the French language (Kristeva *et al*., 1975).

His reflection on general linguistics, though it was not his most frequent occupation, has left important contributions to linguistics, as well as to the constitution of a general semiology. Following this path, he arrived at a distinction expressly made only in 1966 (Benveniste, 1967, 1969a), through which it is possible to comprehend his own theoretical and analytical route. He distinguished two modes of significance in the language: semiotics (that characterizes the sign as an element of the system) and semantics (mode of significance engendered by the enunciation).

Language and Enunciation

An important trait of his work is in the manner in which he considered that the language (the semiotics) contains the marks of the enunciation (of the semantics). He was primarily concerned with the description of the language, of the semiotics, but as a structure that has the marks of the enunciative process that it allows (Arrivé and Normand, 1997).

Regarding the semiotic mode, he carried out studies that had wide repercussions throughout the entire second half of the 20th century. For example, we have the study of personal pronouns, the verbal persons, and the French verbal system. These studies always have the characteristic of describing the forms of the language as marked by their role when enunciated. Through this process, he arrived at a characterization of the personal pronouns and verbal persons that redoes the tripartite division of grammatical persons. For Benveniste, two persons exist (I–you) and enter into a correlation with the nonperson (he).

Regarding the articulation between the semiotic and semantic modes, he left the distinction between the two planes of enunciation that became a classic and is widely utilized. It deals with the distinction between discourse and history. To better understand this distinction (semantic), it is necessary to note that it is done on the basis of description of the language (semiotics). In the study of the French verbs, referred to above, Benveniste (1959) distinguished two paradigms – one that is organized around the *perfect* and another around the *aorist*.

The first includes the present, but the second does not. For Benveniste, the discourse is the enunciation plane marked by the presence of the speaker in what is said, dealing with the functioning of the *perfect* system, while the history is the enunciation plane that does not mark the speaker in what is said; what begins to function is the aorist system.

Still dealing with the relationship of the two modes of significance, he was concerned with important aspects, such as the question of enunciative functioning and the constitution of subjectivity, which appeared, for example, in 'De la subjectivité dans le langage' (1958a) and 'L'appareil formel de l'énonciation' (1970).

In the first of these studies, he developed one of his most decisive theoretical theses. Language is not an instrument of communication; it is constitutive of the subjectivity that is, in truth, intersubjective. There is no I (the subject) without you. And the comprehension of the thesis gains in specificity if we consider another of his better-known texts: 'La nature des pronoms' (1956).

In this work, he considered that the pronominal system is also divided by two different correlations: on the one hand, the personal correlation that separates the person from the nonperson and, within the personal correlation, the subjectivity correlation that separates the first person, the I, from the second person, the you. The 'he' is the mark of the nonperson. If we go back to the French verbal system, we will see that the personal correlation projects itself over the enunciation modes correlated to the discourse, while the nonperson belongs to the historical plane.

In the 'L'appareil formel de l'énonciation' (1970), we will find a search for the characterization of the enunciation's functioning. In this text, Benveniste presented a definition of enunciation, of the semantic level functioning that he already practiced: "the enunciation is putting the language to use by an individual act of utilization" (Benveniste, 1970). In this way, the passage of the language (semiotic) to the enunciation (semantic) is done by the speaker who is, for the entire group of language descriptions that Benveniste offered, the parameter that gives meaning to the enunciations at the enunciative instance. The distinction between the semiotic and the semantic

was fundamental for Benveniste to bring the reflection on the specificity of verbal language in relation to the other semiological systems into the domains of semiological studies. He affirmed that only language combines the two modes of significance (semiotic and semantic), and this is what makes language capable of speaking not only of things and of other semiological systems but of speaking of itself, which means that language is capable of speaking of language, characterizing itself by this metalinguistic capability.

Another important aspect of this distinction is that it permitted Benveniste (1969a) to formulate a relation among the various semiological systems, differing from other more common systems that deal with this relation as something on the order of inclusion or belongingness. For Benveniste, the various semiological systems interpret one another. In other words, their relationships are relationships of signification. And, as mentioned above, the language does not include and is not included by other semiological systems. The difference is in its metalinguistic capability, actioning both the semiotic and the semantic systems.

In the domain of general linguistics, aside from the formulations that sought to characterize the enunciation, in his 'Níveis de análise lingüística' ('Levels of linguistic analysis') (1962), he established the distinction between form and meaning in a very specific manner. He affirmed that, taking any linguistic element, its form is obtained if one observes into what other elements it can be divided, and its meaning is obtained if one observes into which superior level element it is integrated. In this manner, he showed, at the same time, the connection between form and meaning and defined the meaning as belonging to the plane of the relationships in the language.

Another important discussion in which he became involved was the question of sign arbitrariness. In 'Nature du signe linguistique' (1939), he agreed with Saussure on the fundamental character of the value as a constituent of the linguistic sign, but disagreed on the arbitrary character of the significant/signified relationship. For Benveniste, what is arbitrary is the relationship between the sign and the thing. The relationship between significant and signified is necessary. To stay within the Saussuarean system, that is, in the consideration that nothing external to the language is of regard, he brought into play this other characterization of the fundamental relationship of the sign. It is interesting that Saussure disregarded the reference, but Benveniste would later include it (1967, for example) and considered it as belonging to the plane of enunciation (of semantics, in his words).

The Historical Studies

A first and decisive aspect in this regard is that he treated Indo-European as a language just as any other and tried to reconstruct it based on a systematic conception of the language and not as something on the plane of the successivity of the forms (Benveniste, 1935, 1948). This work unfolded in the consideration of the history and culture. Considering that the systems of representation and the social structures are organized like linguistic structures, Beneveniste, through the analysis of the Indo-European languages, dedicated himself to the reconstruction of the culture and history that are signified within them. And, in this work, his position affirming that the categories of thought do not preexist languages gained form and force. These determine those. He also showed this aspect in a specific manner in a text on the categories in Aristotle (Benveniste, 1958b).

These aspects assumed a very particular configuration as he elaborated the linguistic character of signification in an extraordinarily rich form. To illustrate, we quote him: "By comparison and through a diachronic analysis, it is a question of making a signification appear where, in the beginning, we had only a designation. The temporal dimension, therefore, becomes an explicative dimension" (1969b: 12). To him, the temporal dimension is explicative of how something becomes a sign, when a signification, that is not a relation of designation, of reference, then emerges.

Regarding this work, we can recall the comments made by Barthes (1984) when *Problemas de lingüística geral 2* (Problems of general linguistics 2) was published: "This pure linguist, whose objects of study apparently belong to the general linguistic apparatus, transcends, never ceases in reality, to take language in what could be called its concomitances: the work, the history, the culture, the institutions, in short, everything that constitutes the reality of man. The *Vocabulary of the Indo-European Institutions*, the studies of agent names, of the preverbs prae- or vor-, are texts that denature the linguistic discipline, that realize this subversive movement by which the disciplinary compartmentalization crumbles and a new, nameless science appears." (p. 6, l. 3ff.)

Through the systematization, the relationships, Benveniste illuminated the signification of the languages that he studied. He showed that treating signification as a merely situational thing is very little. It is true that he was involved in a search for origins, but what remains is not this. Fundamentally, it is the richness of the question of linguistic signification as something that cannot be reduced to desires or intentions, nor to relationships with objects. What

he called signification is of interest. In other words, in languages, what is interesting are the language relationships. And, in face of this fact, the semiotic order gains in its capacity to describe and explain human phenomena.

Another important question in Benveniste is that his semantic reconstruction procedure included, and regarded as decisive, the consideration of the uses of linguistic forms, "of the contexts in which the form is susceptible to appear. One does not have the right to presume it, positively or negatively, in name of verisimilitude" (1966: 290). Therefore, his reconstruction method necessarily considered what he called the semantic mode of significance. It is by the observation of this mode that the linguist decides on how to organize the semiotic mode.

Another indispensable aspect that should be registered is the important presence of Benveniste's thought in linguistic production from the second half of the 20th century on. To mention just a few, we can recall how Antoine Culioli, Oswald Ducrot, and many others, who today dedicate themselves to semantics based on enunciation studies have Benveniste as a base reference. This reference is not restricted to French linguistics. It extends to all of Europe, including Russia, and America in general. On the other hand, his diachronic work also has interesting repercussions in the work of many that came after him, such as Starobinski.

Introduction

The Berber language is one of the branches of the large Hamito-Semitic (Afroasiatic) linguistic family, which also includes Semitic, Cushitic, ancient Egyptian, and Chadic. With all that this notion implies, Berber can be considered as the 'aboriginal' language of North Africa because currently there is no positive trace of an exterior origin or of the presence of a pre- or non-Berber substratum in this region. As far back as one can go (first Egyptian accounts: cf. Bates, 1914/1970), the Berber language was already installed in its present territory. Particularly, the toponymy has not allowed us to identify, up till now, any kind of pre-

he called signification is of interest. In other words, in languages, what is interesting are the language relationships. And, in face of this fact, the semiotic order gains in its capacity to describe and explain human phenomena.

Another important question in Benveniste is that his semantic reconstruction procedure included, and regarded as decisive, the consideration of the uses of linguistic forms, "of the contexts in which the form is susceptible to appear. One does not have the right to presume it, positively or negatively, in name of verisimilitude" (1966: 290). Therefore, his reconstruction method necessarily considered what he called the semantic mode of significance. It is by the observation of this mode that the linguist decides on how to organize the semiotic mode.

Another indispensable aspect that should be registered is the important presence of Benveniste's thought in linguistic production from the second half of the 20th century on. To mention just a few, we can recall how Antoine Culioli, Oswald Ducrot, and many others, who today dedicate themselves to semantics based on enunciation studies have Benveniste as a base reference. This reference is not restricted to French linguistics. It extends to all of Europe, including Russia, and America in general. On the other hand, his diachronic work also has interesting repercussions in the work of many that came after him, such as Starobinski.

Introduction

The Berber language is one of the branches of the large Hamito-Semitic (Afroasiatic) linguistic family, which also includes Semitic, Cushitic, ancient Egyptian, and Chadic. With all that this notion implies, Berber can be considered as the 'aboriginal' language of North Africa because currently there is no positive trace of an exterior origin or of the presence of a pre- or non-Berber substratum in this region. As far back as one can go (first Egyptian accounts: cf. Bates, 1914/1970), the Berber language was already installed in its present territory. Particularly, the toponymy has not allowed us to identify, up till now, any kind of pre-

Figure 1 Map of the Berber-speaking region in North Africa.

Berber linguistic sediment. Despite numerous theories suggested by linguists since the 19th century in favor of an external origin of the language (Middle East or East Africa), neither prehistoric archaeology nor physical anthropology could show the movement of a population coming from elsewhere; it has even been solidly established that man has been present in North Africa, in a continuous manner, for at least a million years (cf. Camps, 1974, 1980).

Tamazight (the Berber word for language) covers a vast geographical area: all of North Africa, the Sahara, and a part of the West African Sahel. But the countries principally concerned are, by order of demographical importance: Morocco (35–40% of the total population), Algeria (25% of the population), Niger, and Mali (Tuaregs) (Figure 1).

The Berber-Speaking Regions

In Morocco, spoken Berber is spread into three large dialectical areas that cover the totality of the mountainous regions: in the north is the Rif (Tarifit); in the center, the Mid-Atlas and a part of the High-Atlas (Tamazight [Tamazight, Central Atlas]); and in the south/southwest (High-Atlas, Anti-Atlas and Under), the Chleuh domain (Tachelhit/Tašelḥit/Chilha).

In Algeria, the principal Berber-speaking region is Kabylia. In a relatively limited but densely populated surface area, Kabylia (Kabyle; Taqbaylit dialect) alone has two-thirds of Algeria's Berber speakers. The other significant Berber-speaking groups are: the Chaouias (Chaouia; Tachawit) of the Aures region, having in all likelihood a million people, and the people of the Mzab (in Ghardaia and other Ibadhite cities), having a population of between 150 000 and 200 000. There are in fact other Berber-speaking groups in Algeria, but these are modest linguistic islands of only several thousands to tens of thousands of speakers.

The third large group of Berber speakers is the Tuaregs (Tamashaq [Tamasheq], Tamajaq [Tamajaq,

Tawallammat], Tamahaq [Tamahaq, Tahaggart]), straddling several countries across the Sahara-Sahel zone, principally in Niger (±500 000 people) and in Mali (450 000). The other countries: Algeria (Ahaggar, Ajjer dialects), Libya (Ajjer dialect) Burkina-Faso, and even Nigeria, have more limited Tuareg populations. The total Tuareg population is well over 1 million individuals.

The other Berber speaking regions are isolated, often threatened areas, spread out across the south of Mauritania (Zenaga), in Tunisia (in Djerba, in part, and in several villages in the south-central part of the country), in Libya (where Berber-speaking groups are clearly larger and more resistant), and in Egypt (the Siwa Oasis).

But these are only the traditional locations: from the beginning of the 20th century and especially since decolonization, worker emigration and the massive rural exodus that took place throughout the Maghrib have been the basis for the formation of Berber-speaking communities in all the major cities: Algiers and Casablanca are the most outstanding examples. And Paris is one of the three principal Berber-speaking cities of the world, perhaps even the largest!

Linguistic Features

Phonetics and Phonology

The phonological consonantic system of Berber (Basset, 1952/1969; Prasse, 1972–1974) relies on an opposition between tensed and nontensed consonants. Variation is induced by: phonemes borrowed from Arabic (Arabic, Standard) (pharyngeals, some emphatics), a tendency towards spirantization in Northern dialects, and palatalization and labio-velarization.

The vocalic system of Berber is ternary: /a/ vs. /i/ vs. /u/. The schwa [ə] is considered by most researchers as a neutral vowel without phonological status. Intermediary phonemes (/e/, /o/, /ä/) that exist in some dialects (Tuareg, Libya, Tunisia) are recent innovations (Prasse, 1984–1986), stemming from the probable phonologization of former contextually conditioned variants. The same is also probably true of vocalic duration, which has distinctive status in those dialects (for instance, to mark the intensive perfective in Tuareg). It probably originates in an expressive lengthening, or in a quantitative reinterpretation of accentual phenomena.

Morphology

Berber stems are composed of a consonantal root and an inflectional scheme, which is specific to the considered part of speech. There are, for instance, adjectival schemes, verbal (aspectual) schemes, and nominal schemes (Table 1, Table 2).

The verb 'go/go with', is composed of a root (*dd*) and an obligatory aspectual inflection (Table 3).

The morphology of Berber is heavily derivational. For instance, there is a class of labile (ambitransitive) verbs, which varies in size depending on the dialects, and which can be semantically transitivized thanks to a causative-transitive prefix (*s-*). The 'passive' is rare and marked through a *ttw-* prefix, reciprocals and middles are marked thanks to a nasal prefix (*my-*). Those prefixes have variants within each dialect (Table 4).

Case in Berber is limited to an opposition between what is traditionally called 'état libre' and 'état

Table 4 Verbal derivation

Stem	*Prefix*	*Verb*	*Grammar*	*Gloss*
kkəs	+ *s-*	*su-kkəs*	CAUS-take.off.PERFECTIVE	'made X take off'
'take off'	+ *ttw-*	*ttwa-kkəs*	PASS-take.off.PERFECTIVE	'got taken off'
	+ *my-*	*my-kkəs*	RECIP-take.off.PERFECTIVE	'took off from each other'

d'annexion.' The former is unmarked, and the latter marked. 'État libre' is the form taken by nominals in citation form, topic position, direct object, possessee. 'État d'annexion' is the form taken by postverbal subjects, nominals following prepositions and numerals, possessors (Table 5).

This distinction is no longer alive in all dialects. Dialects that have lost the opposition are: Nefoussa, Ghadames, Sokna, Siwa (Siwi) in Egypt and Zenaga of Mauritania.

There are two genders, masculine (unmarked), and feminine (marked). Gender is arbitrary. Feminine gender can function as a diminutive or partitive, or denote an item as opposed to a collection (Table 6).

Number distinctions are between singular and plural. Plural inflections are varied, either formed by affixation, or apophony; some plurals are irregular (Table 7).

There are no articles in Berber. Definiteness is contextually inferrable, word order playing a role in the matter. Anaphoric and deictic particles appear where necessary to disambiguate.

All verbs are completed with a personal or participial affix. Therefore, the minimal utterance is composed of a root, always inflected for aspect, and its obligatory personal affix (and accusative and dative clitics where applicable):

Table 5 Case

	État libre (EL)	*État d'annexion (EA)*
clause	*tafunast* tə-čča cow.EL SUB.3FSG-eat.PERFECTIVE (As for) the cow (she) ate/has eaten.	tə-čča *təfunast* SUB.3FSG-eat.PERFECTIVE cow.EA The cow ate/has eaten.
phrase	*axxam* umə̄ksa house.EL shepherd.EA The shepherd's house	axxam *umə̄ksa* house.EL shepherd.EA The shepherd's house

Table 6 Gender

Noun Form	*Masculine*	*Feminine*

collective vs. item/	*azə̄mmur* 'olives'	*tazə̄mmurt* 'olive tree'

Table 7 Number

Number	*'house'*	*'braid'*	*'heart'*	*'town'*
singular	*axxam*	*asaru*	*ul*	*tamdint*
plural	*ixxamən*	*isura*	*ulawən*	*timdinin*

(1) yə-čča (Taqbaylit)
SUB.3MSG-*eat*.PERFECTIVE
he ate/has eaten

(2) yə-fka yas
SUB.3MPL-*give*.PERFECTIVE DAT.3SG
t idd
ACC.3MSG *proximal.particle*
He gave it to her/him

Constituent Order

Such minimal utterances are very frequent in authentic speech. However, longer utterances, containing noun phrases, also appear. The maximal configuration is examplified below, and illustrates the VSO type:

(3) yə-fka umγar idrimən
SUB.3MSG-*give*.PERFECTIVE *old.man*.EA *money*.EL
i umddak^{w}əl-is
to comrade.EA-POSS.3MSG
the old man gave (some) money to his companion

Only a few quantitative studies on word order have been conducted. Among them, Mettouchi (to appear a) showed that in Taqbaylit, word order was in fact pragmatically motivated. This motivation is also probably true of other dialects. The following table (where V actually stands for a minimal utterance (root+personal affix)) shows the various configurations encountered in authentic speech (Table 8).

This table shows that, whereas the characterization of Berber (here Taqbaylit) as a VO language seems to hold, the status and position of the 'subject' is somewhat more problematic: almost one-fourth of the utterances can appear without one. This special behavior of the subject in Berber has long been recognized in Berber studies. Thus, traditionally, it is the personal affix that is considered as the real subject (and not as an agreement marker), whereas the preverbal coreferential nominal is called 'indicateur de thème' and the postverbal coreferential nominal 'complément explicatif' (Galand, 1964/2002). The positions of nominal constituents are determined to a large extent by pragmatic and semantic factors. Taqbaylit can therefore be considered as a nonconfigurational language, and more precisely, as a pro-

Table 8 Constituent order found in a conversational excerpt (143 third-person verbal predications)

VS	*SV*	*V*	*OV*	*VO*
60 42% (incl. VSO 3%)	25 17.5% (incl. SVO 2%)	35 24.5%	1 0.5%	22 15.5%
85 59.5%			58 40.5%	

nominal argument language. Quantitative studies must be conducted on other dialects to see whether this characterization is valid for Berber as a whole.

Berber is head marking at the level of the clause, but dependent marking at the level of the phrase. At the level of the phrase, Berber is also more rigid, and has the following properties among Greenberg's universals: it has prepositions, the possessor follows the possessee, the modifier (as well as relative clauses) follows the head noun and affixes are mostly prefixes.

Relative clauses (Galand, 1988) are distinguished according to the status of the antecedent: if it is coreferential to the subject of the relative clause, a participle is used. This form is composed of a root inflected for aspect, and an invariant circumfix (in Taqbaylit), or a limited set of affixes (in Tuareg) (Table 9).

In some syntactic contexts (relative clauses, interrogation, negation, TAM preverbs), clitics change position and attach themselves to the new head of the sentence (negative marker, interrogative pronouns or relativizer, preverb). This phenomenon of cliticclimbing is examplified below:

(4) ad as t idd
irrealis DAT.*3SG* ACC.*3MSG* *proximal.particle*
yə-fk
SUB.*3MSG-give*.PERFECTIVE
He will give it to her/him

Table 9 Participial circumfixes

3 M	*məqq^{w}r*	
3 F	*məqq^{w}r-t*	

Predicate Nominals and Related Constructions

Verbs very often are the center of predication, but predicates can also be nonverbal. Nouns, adjectives, and free pronouns can function as predicates.

Attribution is marked, either, as in Tuareg, through a simple juxtaposition of nouns

(5) Mûsa amγar n Ahaggar
Mûsa *chief*.EL *of* *Ahaggar*
Mûsa is the chief of Ahaggar

or, as in most Northern Berber dialects, thanks to a special invariant copula (particle):

(6) d amur-iw
predicative.particle *share*.EL-*my*
It's my share

Focus constructions are mostly based on attributive clauses (Taqbaylit):

(7) d amur-iw i
predicative.particle *share*.EL-*my* *relator*
dd y-uk^{w}ər
prox.particle SUB.*3MSG-steal*.PERFECTIVE
It's my share that he stole

But focus-fronting (traditionally called 'anticipation renforcée') is also encountered (Tuareg):

(8) tagəlla a tə-kša
bread DEMONSTRATIVE SUB.*3FSG-eat*.PERFECTIVE
təmγart
old-woman.EA
It's bread that the old woman has eaten

Attributive predication can also be expressed thanks to a special category of verbs, quality verbs, which are only alive in some dialects, among them Taqbaylit. This category represents approximately 60 verbs, mostly referring to size and color, but also to other, more unexpected, semantic domains (Chaker, 1983: 117–118). It is characterized morphologically by a special suffixal conjugation in the perfective, in the 3rd person and the plural. Here is the paradigm of affixes for the verb *məqq^{w}r* 'be big' (Table 10).

'Existence' is marked thanks to the verb *ili* 'be,' 'exist,' in the perfective (Taqbaylit).

(9) lla-n waman

Table 11 Basic aspectual opposition

[a]Frequency counts are based on a conversational corpus.

exist.PERFECTIVE-SUB.3MPL *waters*.EA
There is water

Location can be predicated thanks to the association of an interrogative pronoun and an accusative clitic (Taqbaylit):

(10) anda t umur-iw?
where ACC.3MSG *share*.EA-*my?*
where is my share?

Possession is mostly predicated through the association of a preposition and a special personal affix (Taqbaylit):

(11) γur-s sin yəzgarən
with-him *two* *oxen*.EA
He has two oxen

Aspect

Berber dialects are basically aspectual, with evolutions towards tensedness in some of them (Tachelhit, cf. Leguil, 1992). A. Basset (1929, 1952/1969) was the first to reconstruct the basic ternary system of Berber, which opposes three forms: aorist ('aoriste simple'), perfective ('accompli,' 'prétérit'), and imperfective ('inaccompli,' 'aoriste intensif') (Table 11).

All dialects have a special negative form (negative perfective, called 'accompli négatif' or 'prétérit négatif') that is used instead of the perfective after the negative marker. Some dialects also have secondary, more recent, forms: negative imperfective ('inaccompli négatif'), and resultative perfective ('accompli résultatif'). Here is for instance the full system of Tuareg (Table 12).

In all dialects, those forms are preverbed by TAM markers, giving rise to various configurations. Taking into account the preverbs is absolutely necessary to describe properly the oppositions at stake in Berber (Chaker, 1997). Among those preverbs, the most frequent cross-dialectally are *ad* (irrealis), *rad* (future), and *la* (progressive). They stem from ancient deictic or locative markers, and from auxiliaries.

Moreover, verbal negation (*ur*) acts on those oppositions, giving rise to asymmetries (Mettouchi, to appear b). Here are, for instance, the actual oppositions encountered in Taqbaylit (Table 13).

Further Resources

A systematic, regular bibliographic orientation can be found in the *Annuaire de l'Afrique du Nord* (Paris, CNRS) since 1965 (volume IV), edited by Lionel Galand, then Salem Chaker and Claude Brenier-Estrine. There is also a recent, very complete bibliographic recapitulation in *Langues et littératures berbères des origines à nos jours*. Bibliographie internationale (Paris, Ibis Press, 1997), and a bibliographic database developed by Salem Chaker, that can be queried online on the Internet site of the Berber Research Center.

Bergin, Osborn Joseph (1873–1950)

G Mac Eoin, National University of Ireland, Galway, Ireland

© 2006 Elsevier Ltd. All rights reserved.

Osborn Bergin was born in Cork in 1873 of a humble Protestant family. While a student of classics at Queen's College Cork he became interested in the Irish language and went to the Béarra peninsula to learn it. In those years he was deeply attached to the Gaelic League in Cork, which was in constant strife with the League's authorities in Dublin. Having taught in secondary schools in Cork he was appointed lecturer in Irish at Queen's College in 1897. By this time he was acquiring a reputation for accurate scholarship in Irish. He began to publish Irish texts, *Caoineadh Airt Uí Laoghaire* (1896), *Laoi Chnuic an Áir* (1897), and *Éachtra Lomnachtáin an tSléibhe Riffe* (with Eoin Mac Néill, 1901) – all Modern Irish texts. He attended the School of Irish Learning, founded by Kuno Meyer in 1903, and acquired a knowledge of Old Irish. From then on he devoted his attention equally to the modern and the old language. The school awarded him a scholarship, funded by Alice Stopford Green, to study for two years in Germany. There he attended the lectures of Heinrich Zimmer in Berlin and of Rudolf Thurneysen in Freiburg, two of the greatest Celtic scholars of the time. He took his doctorate under Thurneysen in 1906 with a dissertation entitled *Contributions to the history of palatalisation in Old Irish* (*Ériu* III, 1907, 50–91). He succeeded John Strachan as Professor at the School of Irish Learning in 1908 and in 1909

Osborn Bergin was born in Cork in 1873 of a humble Protestant family. While a student of classics at Queen's College Cork he became interested in the Irish language and went to the Béarra peninsula to learn it. In those years he was deeply attached to the Gaelic League in Cork, which was in constant strife with the League's authorities in Dublin. Having taught in secondary schools in Cork he was appointed lecturer in Irish at Queen's College in 1897. By this time he was acquiring a reputation for accurate scholarship in Irish. He began to publish Irish texts, *Caoineadh Airt Uí Laoghaire* (1896), *Laoi Chnuic an Áir* (1897), and *Éachtra Lomnachtáin an tSléibhe Riffe* (with Eoin Mac Néill, 1901) – all Modern Irish texts. He attended the School of Irish Learning, founded by Kuno Meyer in 1903, and acquired a knowledge of Old Irish. From then on he devoted his attention equally to the modern and the old language. The school awarded him a scholarship, funded by Alice Stopford Green, to study for two years in Germany. There he attended the lectures of Heinrich Zimmer in Berlin and of Rudolf Thurneysen in Freiburg, two of the greatest Celtic scholars of the time. He took his doctorate under Thurneysen in 1906 with a dissertation entitled *Contributions to the history of palatalisation in Old Irish* (*Ériu* III, 1907, 50–91). He succeeded John Strachan as Professor at the School of Irish Learning in 1908 and in 1909

was appointed Professor of Old and Middle Irish at the newly founded University College, Dublin. He continued in that post until 1940 when he resigned to become Senior Professor in the School of Celtic Studies at the Dublin Institute for Advanced Studies, then in the course of being established. He died in 1950.

His publications include *Irish Grammatical Tracts* (1915–1928), an edition of the grammatical treatises compiled by the bardic poets in the Middle Ages, a selection of bardic verse published over the years in *Studies* and other periodicals and collected by David Greene and Fergus Kelly in *Irish bardic poetry* (1970). With R. I. Best he produced a diplomatic edition of the 11th-century manuscript *Lebor na hUidre* (1929), the earliest Irish manuscript containing narrative material. With D. A. Binchy he edited *Tochmarc Étaíne,* the triple tale of the goddess Étaín (1938). His greatest work was the edition, again with Binchy, of the translation of Thurneysen's *Handbuch des Alt-Irischen* (1909) as *A Grammar of Old Irish* and his *Old Irish Reader* (1946–1949). He edited *Ériu,* originally the journal of the School of Irish Learning, and was for many years General Editor of the *Dictionary of the Irish Language based mainly on Old and Middle Irish materials* (1913–1976). His reputation as an accurate scholar persists to the present day, particularly in the area of bardic poetry, but he is also said to have preferred reading detective novels to academic work.

Bergsland, Knut (1914–1998)

E Hovdhaugen, University of Oslo, Oslo, Norway

© 2006 Elsevier Ltd. All rights reserved.

Knut Bergsland was born in Kristiania (Oslo), Norway. He studied classical philology in Oslo and Paris. In Paris, his studies also included Hittite, Akkadian, and Old Armenian. In 1938 his fiancé got a job in Tromsø in the north of Norway close to a Sámi-speaking area. When visiting her, he used the time when she was working to establish contact with the local Sámi communities to learn their language. Bergsland finished his M.A. studies in 1940 with Latin as the main subject, and during the war he continued to study the little-known South Sámi language spoken in the mountain areas of Middle Norway. This work resulted in a collection of South Sámi texts and a grammar published in 1946, which also was his Ph.D. dissertation. This was the first grammar of a Sámi language written by a linguist with a thorough training in general linguistics, and it was one of the first grammars written within the framework of Hjelmslev's glossematic theory. Unfortunately, the book was written in Norwegian and did not have the impact it could have had on the development of linguistic theory.

In 1947 Bergsland became Professor of Finno-Ugric Linguistics at the University of Oslo, a position he held until 1981. As a professor he devoted most of his research to the documentation and description of the Sámi (Saami, North and Saami, South) languages of Norway with a special focus on the South Sámi language, on which his publications included a very readable grammar, text collections and a dictionary. Bergsland was also a major supporter of the South Sámis' fight to survive linguistically and culturally.

Quite early Bergsland began to study the Eskimo languages and produced a grammar (1955) of West Greenlandic that formed the basis of all later studies of Eskimo languages. In 1949–1950 Bergsland was visiting professor at Indiana University in Bloomington, and during that time he made his first visit to the Aleut Islands. Gradually, the study of Aleut became his main field of research. When he retired at the age 67, it was to be able to devote all his time to the study of Aleut. He published a number of minor articles on Aleut linguistics, several large collections of Aleut texts, a comprehensive dictionary, and an Aleut grammar (1997) published one year before his death. His publications on Aleut are superb examples of how to document a threatened language both for

Learning, and was for many years General Editor of the *Dictionary of the Irish Language based mainly on Old and Middle Irish materials* (1913–1976). His reputation as an accurate scholar persists to the present day, particularly in the area of bardic poetry, but he is also said to have preferred reading detective novels to academic work.

Bermuda: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Bermuda is a group of islands in the Atlantic Ocean and a nominal British territory with self-government, which was guaranteed in 1968. It comprises Ireland Island (north and south), Boaz Island, Somerset, Main, St. David's, and St. George's. It was discovered by the Spanish in the 16th century, but it was uninhabited until 1609 when the first British colonizers appeared, at first by accident (when the flagship *Sea Venture* was caught in a tempest with 150 officials) and later deliberately. In 1684 Bermuda became a British crown colony.

The islands (first called Somers Islands) had no permanent population for a long time. Later they were populated by long-term colonizers and slaves. Two-thirds of the current population (64 935 according to a July 2004 estimate) are of African origin, descended from slaves brought in large numbers by colonizers starting in 1616. Some slaves were brought in by British settlers, not directly from Africa but via the Caribbean regions. Some Native Americans were also transported to Bermuda in the 17th and 18th centuries as slaves or prisoners of war. Slavery was formally abolished in Bermuda in 1834.

After the African population, the second-largest (33%) ethnic group of Bermudians are Caucasians, who came as colonists and stayed for a while. Many are of European extraction, descending from British colonists who emigrated here, or were imported as slaves for a period and later earned their freedom. Yet another sizeable group is made up by the one-time Portuguese agricultural laborers brought from the Madeira Islands and from the Azores. More recent arrivals have come, in order of numbers, from Canada, the United Kingdom, and the United States.

The official language of the island is English. Other major languages spoken are Bermudan English (a local English dialect) and Portuguese.

Bertoni, Giulio (1878–1942)

J Albrecht, University of Heidelberg, Heidelberg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Giulio Bertoni was first and foremost a traditional philologist; linguistics in the strictest sense of the term plays only a secondary role in his extremely rich scientific oeuvre (nearly 1400 titles; see Monteverdi, 1952). He was born in Modena on August 26, 1878; all his life he remained attached to his native town, which plays an important part in his historical and philological publications. He attended the University of Turin from 1897 to 1903 and, after having gained his doctorate, he went to Florence, Paris, and Berlin to gather academic experience. During these years he came into contact with a number of the leading scholars of his time, e.g., Pio Rajna, Paul Meyer, Jules Gilliéron (*see* **Gilliéron, Jules (1854–1926)**), Antoine Thomas, Alfred Jeanroy, and Adolf Tobler. In 1905 he was appointed to the chair of Romance philology at the University of Fribourg (Switzerland), which he held until 1921. In this period he founded the *Archivum Romanicum* (1917), which quickly gained a leading position among the philological reviews and was published from 1943 onward as *Cultura Neolatina*. In 1921 he returned to the University of Turin, where he held the chair of Romance philology for seven years. The collaboration with his colleague Matteo Bartoli (*see* **Bartoli, Matteo Giulio (1873–1946)**) resulted in an introduction to 'neolinguistics,' to which Bertoni contributed the theoretical and Bartoli the practical part (Bartoli and Bertoni, 1928). In these years he was exposed to the influence of Benedetto Croce (*see* **Croce, Benedetto (1866–1952)**) and of Giovanni Gentile, the intellectual leader of the Fascist Party, which was to be decisive for his philosophical convictions.

Bertoni finished his career most honorably. From 1928 until his death in Rome on May 28, 1942, he occupied the chair of Romance philology at the University of Rome; he became a member of the editorial staff of the *Enciclopedia Italiana* and was elected member of the Italian Academy *(accademico d'Italia)* in 1932. The efforts of his last years were directed toward the compilation of a great Italian dictionary that never got beyond the letter C.

Bertoni's works of lasting significance lie in the field of philology. His contribution to general linguistics seems to be merely of historical interest in the late 20th century. Like Saussure (*see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and his structuralistic followers, Bertoni was obsessed with the problem of discerning the proportion between the individual,

the benefit of the local community and for other linguists.

Bergsland was an excellent linguist, but linguistic theory interested him much less than languages and their speakers. He sometimes got deeply involved in the problems of the language communities he worked in and became a strong spokesman for their rights.

Bertoni, Giulio (1878–1942)

J Albrecht, University of Heidelberg, Heidelberg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Giulio Bertoni was first and foremost a traditional philologist; linguistics in the strictest sense of the term plays only a secondary role in his extremely rich scientific oeuvre (nearly 1400 titles; see Monteverdi, 1952). He was born in Modena on August 26, 1878; all his life he remained attached to his native town, which plays an important part in his historical and philological publications. He attended the University of Turin from 1897 to 1903 and, after having gained his doctorate, he went to Florence, Paris, and Berlin to gather academic experience. During these years he came into contact with a number of the leading scholars of his time, e.g., Pio Rajna, Paul Meyer, Jules Gilliéron (*see* **Gilliéron, Jules (1854–1926)**), Antoine Thomas, Alfred Jeanroy, and Adolf Tobler. In 1905 he was appointed to the chair of Romance philology at the University of Fribourg (Switzerland), which he held until 1921. In this period he founded the *Archivum Romanicum* (1917), which quickly gained a leading position among the philological reviews and was published from 1943 onward as *Cultura Neolatina*. In 1921 he returned to the University of Turin, where he held the chair of Romance philology for seven years. The collaboration with his colleague Matteo Bartoli (*see* **Bartoli, Matteo Giulio (1873–**

1946)) resulted in an introduction to 'neolinguistics,' to which Bertoni contributed the theoretical and Bartoli the practical part (Bartoli and Bertoni, 1928). In these years he was exposed to the influence of Benedetto Croce (*see* **Croce, Benedetto (1866–1952)**) and of Giovanni Gentile, the intellectual leader of the Fascist Party, which was to be decisive for his philosophical convictions.

Bertoni finished his career most honorably. From 1928 until his death in Rome on May 28, 1942, he occupied the chair of Romance philology at the University of Rome; he became a member of the editorial staff of the *Enciclopedia Italiana* and was elected member of the Italian Academy *(accademico d'Italia)* in 1932. The efforts of his last years were directed toward the compilation of a great Italian dictionary that never got beyond the letter C.

Bertoni's works of lasting significance lie in the field of philology. His contribution to general linguistics seems to be merely of historical interest in the late 20th century. Like Saussure (*see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and his structuralistic followers, Bertoni was obsessed with the problem of discerning the proportion between the individual, 'idiosyncratic' part and the supra-individual, systematic part in language, but the solution he offered was very different from that proposed by the structuralists. The distinction he drew between *lingua* as the social and *linguaggio* as the individual part of language, which is vaguely reminiscent of the Saussurean trichotomy *langage–langue–parole*, was sharply criticized by Benedetto Croce for its eclectic and partly contradictory character.

Beschi, Constanzo Guiseppe (1680–1747)

J-L Chevillard, CNRS–University of Paris 7, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

The importance of Constanzo Guiseppe Beschi for Tamil studies cannot be overestimated. Born in Italy, he joined the Jesuits in 1698 and was sent to India which he reached in 1711 and where he spent 36 years (see Besse, 1918; Meenakshisundaram, 1974). He is referred to in Tamil as Vīramāmuṉivar. Although he was not the first European to produce a grammatical description of Tamil, having been preceded by Henrique Henriques (also spelled as Anriquez) who had composed a Tamil grammar in Portuguese around the middle of the 16th century (see Vermeer, 1982), Beschi's grammar of *Koṭuntamiḻ*, composed in 1728 in Latin, rapidly became the standard description of common Tamil for foreign missionaries, and although he himself was a Jesuit, it was printed by the Protestants as early as 1738. It was also to be translated into English and become a reference grammar in the 19th century. Having understood that he could only have a limited impact on the literary elite if he restricted himself to ordinary Tamil, Beschi embarked on a study of Literary Tamil and composed three grammars: two in Latin and one in Tamil, the *Toṉṉūl Viḷakkam,* on the model of traditional Tamil grammars. He composed an epic poem *Tēmpāvaṇi* (in honor of St Joseph) and made a Latin translation of the first two books of the famous classic called *Kuṟaḷ*. His name is also associated with a writing reform, which made it possible to distinguish *e* from *ē* on

1946)) resulted in an introduction to 'neolinguistics,' to which Bertoni contributed the theoretical and Bartoli the practical part (Bartoli and Bertoni, 1928). In these years he was exposed to the influence of Benedetto Croce (*see* **Croce, Benedetto (1866–1952)**) and of Giovanni Gentile, the intellectual leader of the Fascist Party, which was to be decisive for his philosophical convictions.

Bertoni finished his career most honorably. From 1928 until his death in Rome on May 28, 1942, he occupied the chair of Romance philology at the University of Rome; he became a member of the editorial staff of the *Enciclopedia Italiana* and was elected member of the Italian Academy *(accademico d'Italia)* in 1932. The efforts of his last years were directed toward the compilation of a great Italian dictionary that never got beyond the letter C.

Bertoni's works of lasting significance lie in the field of philology. His contribution to general linguistics seems to be merely of historical interest in the late 20th century. Like Saussure (*see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and his structuralistic followers, Bertoni was obsessed with the problem of discerning the proportion between the individual, 'idiosyncratic' part and the supra-individual, systematic part in language, but the solution he offered was very different from that proposed by the structuralists. The distinction he drew between *lingua* as the social and *linguaggio* as the individual part of language, which is vaguely reminiscent of the Saussurean trichotomy *langage–langue–parole*, was sharply criticized by Benedetto Croce for its eclectic and partly contradictory character.

Beschi, Constanzo Guiseppe (1680–1747)

J-L Chevillard, CNRS–University of Paris 7, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

The importance of Constanzo Guiseppe Beschi for Tamil studies cannot be overestimated. Born in Italy, he joined the Jesuits in 1698 and was sent to India which he reached in 1711 and where he spent 36 years (see Besse, 1918; Meenakshisundaram, 1974). He is referred to in Tamil as Vīramāmuṉivar. Although he was not the first European to produce a grammatical description of Tamil, having been preceded by Henrique Henriques (also spelled as Anriquez) who had composed a Tamil grammar in Portuguese around the middle of the 16th century (see Vermeer, 1982), Beschi's grammar of *Koṭuntamiḻ*, composed in 1728 in Latin, rapidly became the standard description of common Tamil for foreign missionaries, and although he himself was a Jesuit, it was printed by the Protestants as early as 1738. It was also to be translated into English and become a reference grammar in the 19th century. Having understood that he could only have a limited impact on the literary elite if he restricted himself to ordinary Tamil, Beschi embarked on a study of Literary Tamil and composed three grammars: two in Latin and one in Tamil, the *Toṉṉūl Viḷakkam,* on the model of traditional Tamil grammars. He composed an epic poem *Tēmpāvaṇi* (in honor of St Joseph) and made a Latin translation of the first two books of the famous classic called *Kuṟaḷ*. His name is also associated with a writing reform, which made it possible to distinguish *e* from *ē* on

the one hand, and *o* from *ō* on the other hand. He also made his mark in the field of lexicography with several dictionaries (see James, 2000), the most well-known being the *Caturakarāti*. He is equally considered as one of the fathers of the Tamil prose, being famous for composing the story *Paramārtta Kuruvin Katai* ('The adventures of the Guru Simpleton'; see Blackburn, 2002).

Bhandarkar, Ramakrishna Gopal, Sir (1837–1925)

F Britto, Sophia University, Tokyo, Japan

© 2006 Elsevier Ltd. All rights reserved.

One of the greatest Indologists, Sir Ramakrishna Gopal Bhandarkar was born on July 6, 1837, in Malvan, Maharashtra. After his schooling in Rajapur and Ratnagiri, he entered the Elphinstone Institute of Bombay; there he was deeply influenced by Sidney Owen, who instilled in young Bhandarkar a yearning for truth and academic excellence, and E. I. Howard, who spurred his interest in Sanskrit and Indology. Bhandarkar obtained his M.A. in 1863, with Sanskrit as his second language. After serving briefly as the headmaster of Ratnagiri English School, his alma mater, he moved to Elphinstone College, Bombay, in 1867 to teach Sanskrit. He became Assistant Professor of Sanskrit in 1872 and Professor in 1881. He retired from government service in 1893. He was a member of the University of Bombay Syndicate (1873–82) and later the university's vice-chancellor (1893–95). He also served in the Legislative Council (1903–5). He died on August 24, 1925.

Academically outstanding since childhood, Bhandarkar was a prolific author of books and articles in areas related to Sanskrit, philology, history, inscriptions, religions, philosophy, education, and social reform. Among his language-related works are *The first book of Sanskrit* (1864) and *The second book of Sanskrit* (1868), which have helped generations of natives and foreigners to learn the Vedic language. His critical edition of Bhavabhuti's *Malati-Madhava with the commentary of Jagaddhara* (1876) is based on nine manuscripts of the play that he had collected. His monumental *Reports on the search for Sanskrit manuscripts*, published during the period 1882–1891 on assignment from the Bombay government, are treasure troves of literary, philosophical, and religious resources, revealing hitherto unknown manuscripts and helping scholars to date historical works.

Bhandarkar was the first to hold the position of the Wilson Philological Lecturer at the University of Bombay. In 1877, he delivered seven in-depth lectures on Sanskrit, Pali, and related languages and dialects. He dealt with the phases Sanskrit went through, the development of Pali and Prakrits, the linguistic systems of later Indo-Aryan languages like Marathi and Hindi, and their genealogical relationships. These lectures "laid the foundations of linguistic studies of Indo-Aryan family of languages" (Ghatage quote from Dandekar, 1976: 143). He addressed the

the one hand, and *o* from *ō* on the other hand. He also made his mark in the field of lexicography with several dictionaries (see James, 2000), the most well-known being the *Caturakarāti*. He is equally considered as one of the fathers of the Tamil prose, being famous for composing the story *Paramārtta Kuruvin Katai* ('The adventures of the Guru Simpleton'; see Blackburn, 2002).

Bhandarkar was the first to hold the position of the Wilson Philological Lecturer at the University of Bombay. In 1877, he delivered seven in-depth lectures on Sanskrit, Pali, and related languages and dialects. He dealt with the phases Sanskrit went through, the development of Pali and Prakrits, the linguistic systems of later Indo-Aryan languages like Marathi and Hindi, and their genealogical relationships. These lectures "laid the foundations of linguistic studies of Indo-Aryan family of languages" (Ghatage quote from Dandekar, 1976: 143). He addressed the

Congress of Orientalists in Vienna in 1886, showing the participants rare manuscripts and reciting a Sanskrit poem he had composed for the occasion.

Most notable among his numerous other works are *Early history of the Deccan*, a groundbreaking and critical study of the Deccan, and *A peep into the early history of India*, a short but carefully reconstructed history with evidence from archaeological finds, coins, and inscriptions. *Vaishnavism, Saivism and minor religious systems* (1913) is one of his best and most widely read books. It traces the origin and development of different branches of Hinduism (500 B.C.–1700 A.D.) and Jainism.

Bhandarkar was a member of Asiatic and Oriental societies in the U.K., Italy, United States, France, Germany, and Russia. He was in touch with eminent Orientalists of his day, such as Max Muller and Rhys Davids. In recognition of his exceptional scholarship, he received doctorates from the universities of Göttingen (1885), Bombay (1904), and Calcutta (1908) and was knighted in 1911. On his 80th birthday, a commemorative volume of essays authored by his admirers and students was presented to him, and the Bhandarkar Oriental Research Institute was formally inaugurated by the governor of Bombay, with generous funding from the Tatas, to promote a spirit of enquiry into the literary, social, and political history of India.

Bhartṛhari

S Shukla, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

The Buddhist pilgrim I-ching, who traveled to India in A.D. 671–695, tells us that a Buddhist poet and grammarian, Bhartṛhari, died in India in about 651. I-ching cites a verse in which Bhartṛhari reproaches himself for his inability to decide between the monastic life and the world (Keith, 1948: 176).

Bhartṛhari became well known for his verses compiled in the *Śatakas* (Hundreds), which consist of *Nīti–Śatakam*, which is about political wisdom, *Śri-Ngāra–Śatakam*, which contains reflections on erotic passion, and *Vairāgya–Śatakam*, which contains poems on renunciation.

Bhartṛhari is also the author of the great grammatical treatise *Vākya-Padīya* (Relating to Sentences and Words). In its first chapter, the *Brahma* or *āgama-Kāṇḍa* (Brahma or The Origin Section), he discusses the philosophical aspects of speech. The second chapter, the *Vākya-Kāṇḍa* (Sentence Section), is about nature of sentences and meaning, and the third chapter, *Pada-* or *Prakīrṇa-Kāṇḍa* (Word or Miscellaneous Section), is divided into 14 subchapters and is about the grammatical aspects of linguistic forms.

Bhartṛhari is also believed to have written the *Bhaṭṭi-Kāvya* (Bhaṭṭi Epic), a work that, in verse form, illustrates the rules of Sanskrit grammar, which, the poet says, are a lamp to those whose eye is grammar; but without the grammar, are like a mirror in the hands of the blind (Chaitanya, 1962: 270). The word *bhaṭṭi* is a later (Prakrit) form of *bhartṛ*, which led tradition to identify Bhartṛhari with the poet Bhaṭṭi of the same century. But a comparison of their verses suggests that there is nothing but the name to support this suggestion (Keith, 1948: 116).

As an illustration of his poetry, consider the following (*Vairāgya–Śatakam* 112):

> kṣaṇam bālo bhūtvā kṣaṇam api yuvā kāmarasikaḥ
> kṣaṇam vittair hīnaḥ kṣaṇam api ca sampūrṇavibhavaḥ
> jarājīrṇair aṅgair naṭa iva valīmaṇḍitatanur
> naraḥ sāṁsārānte viśati yamadhānīyavanikām.
> "For a moment a youngster, for a moment an amorous youth, for a moment bereft of riches, for a moment at the height of opulence; at life's end, with limbs worn out by old age and a wrinkle-adorned face, man, like an actor, retires behind the curtain of death."

Bhartṛhari

S Shukla, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

The Buddhist pilgrim I-ching, who traveled to India in A.D. 671–695, tells us that a Buddhist poet and grammarian, Bhartṛhari, died in India in about 651. I-ching cites a verse in which Bhartṛhari reproaches himself for his inability to decide between the monastic life and the world (Keith, 1948: 176).

Bhartṛhari became well known for his verses compiled in the *Śatakas* (Hundreds), which consist of *Nīti–Śatakam*, which is about political wisdom, *Śri-Ngāra–Śatakam*, which contains reflections on erotic passion, and *Vairāgya–Śatakam*, which contains poems on renunciation.

Bhartṛhari is also the author of the great grammatical treatise *Vākya-Padīya* (Relating to Sentences and Words). In its first chapter, the *Brahma* or *āgama-Kāṇḍa* (Brahma or The Origin Section), he discusses the philosophical aspects of speech. The second chapter, the *Vākya-Kāṇḍa* (Sentence Section), is about nature of sentences and meaning, and the third chapter, *Pada-* or *Prakīrṇa-Kāṇḍa* (Word or Miscellaneous Section), is divided into 14 subchapters and is about the grammatical aspects of linguistic forms.

Bhartṛhari is also believed to have written the *Bhaṭṭi-Kāvya* (Bhaṭṭi Epic), a work that, in verse form, illustrates the rules of Sanskrit grammar, which, the poet says, are a lamp to those whose eye is grammar; but without the grammar, are like a mirror in the hands of the blind (Chaitanya, 1962: 270). The word *bhaṭṭi* is a later (Prakrit) form of *bhartṛ*, which led tradition to identify Bhartṛhari with the poet Bhaṭṭi of the same century. But a comparison of their verses suggests that there is nothing but the name to support this suggestion (Keith, 1948: 116).

As an illustration of his poetry, consider the following (*Vairāgya–Śatakam* 112):

> kṣaṇam bālo bhūtvā kṣaṇam api yuvā kāmarasikaḥ
> kṣaṇam vittair hīnaḥ kṣaṇam api ca sampūrṇavibhavaḥ
> jarājīrṇair aṅgair naṭa iva valīmaṇḍitatanur
> naraḥ sāṁsārānte viśati yamadhānīyavanikām.
> "For a moment a youngster, for a moment an amorous youth, for a moment bereft of riches, for a moment at the height of opulence; at life's end, with limbs worn out by old age and a wrinkle-adorned face, man, like an actor, retires behind the curtain of death."

As an illustration of his thoughts on grammar, consider his discussion on the nature of action verbs in the *Vākya-Padīya*. In Sanskrit, action verbs such as *pacati* 'he cooks' are given all together in the form of a process consisting of successive parts: a beginning, a middle, and an end; in constrast, *pāka* 'cooking' is given as a whole without any process in which the parts are separately organized but apprehended as being simultaneous with the whole (Joshi and Roodbergen, 1981: 90). Commenting on this, Bhartṛhari says (*Vākya-Padīya* 3.8.4, 3.8.1, 3.8.42):

> guṇabhūtair avayavaiḥ samūhaḥ kramajanmanām,
> buddhyā prakalpitābhedaḥ kriyeti vyapadiśyate.

"A whole (formed) of (parts) originating in a sequence, mentally conceived as no different from its parts which are subordinate (to it), is called *kriyā* 'action.'"

> yāvat siddham asiddham vā sādhyatvenābhidhīyate,
> āśritakramarūpvāt tat kriyeti pratīyate.

"As long as (something), whether completed (in the past) or not (yet) completed (in the present or future) is mentioned as a *sādhya* 'sequential process', it is understood to be a *kriyā* 'action' in as much a it takes the form of a sequence (of parts)."

> siddhasyārthasy pākādeḥ kathāṁ sādhanayogitā,
> sādhyatve vā tiṇantena kṛtāṁ bhedo na kaś ca na.

"How can a meaning like *pāka* 'cooking,' etc. which is *siddha* (apprehended as being simultaneous with the whole) be connected with *sādhana* 'operators'? Or, if it were (supposed to consist) of *sādhya* 'sequential process,' then there would be no difference (in the meaning conveyed) between *kṛt* (derivatives) and finite verbs."

A second example of Bhartṛhari's thoughts on grammar is his reflection on language and speech. In *Vākya-Padīya*, he discusses the relationship between the perceived utterances of a language and the language itself under the theory of *sphoṭa* 'bursting.' This theory had been discussed by Patañjali (2nd century B.C.) in his *Mahābhāṣya* (The Great Commentary), where he says, "dvau śabdātmanau nityaḥ kāryaśca" [the word (has a) dual representation, (one) as a permanent entity, (the other as an) affect] (Agnihotri, 1963: 43). The theory essentially says that there are two aspects in a linguistic element: the actual event of sound realization, or *dhvani*, and the represented entity, *sphoṭa*, which is actualized by *dhvani*. This naturally leads to the existence of (1) sentence *sphoṭa*, a single meaningful symbol realized by a succession of articulated sounds or *dhvani*; (2) word *sphoṭa*, actualized by a succession of sounds or *dhvani;* and (3) sound or *varṇa sphoṭa*, a permanent unit of distinctive sound capable of semantic differentiation, actualized by its phonetic manifestation or *dhvani*.

In all this, Bhartṛhari considers the sentence to be the primary linguistic unit and regards it as a single undivided element conveying its meaning in a flash, just as a picture is first perceived as a unit despite its components of colored shapes (*Vākya-Padīya* 1.89, 1.90). He, therefore, considers the sentence *sphoṭa* to be the real *sphoṭa* and the word *sphoṭa* and the sound or *varṇa sphoṭa* to be merely the means for its realization.

Bhartṛhari also wrote a commentary on Patañjali's *Mahābhāṣya*, which has been lost. However, its influence survives in the great work of Kaiyaṭa (12th century A.D.), who informs us in the introduction of his *Mahābhāṣya-Pradīpa* (That Which Enlightens the *Mahābhāṣya*) that in commenting on Patañjali he has followed Hari, that is, Bhartṛhari (Belvalkar, 1976: 35).

It can be said that Bhartṛhari was the last independent thinker in the field of grammar, joining the ranks of Pāṇini, Kātyāyana, and Patañjali, and that his *Vākya-Padīya* was the last original contribution to the field, bringing the development of the discipline of Sanskrit grammar to a conclusion.

Bhutan: Language Situation

Bhutan is a Buddhist kingdom located in the Himalaya east of Nepal. It is bordered by the Tibetan Autonomous Region of China on the north and northwest and by India on the south and east. Its population is about 750 000.

Much of Bhutan's culture is shared with Tibet, although with local particularities. The indigenous name of the country, Druk yul (*'brug yul* 'dragon country' in Written Tibetan (WT)), refers to the established religion, the Drukpa Kagyupa sect of Tibetan Buddhism. The national language, Dzongkha, is linguistically a dialect of Tibetan, that is, essentially a modern descendant of Classical Tibetan, which to Bhutanese is Choeke (see below) or 'Classical Dzongkha'. What is often called Drukpa culture traditionally prevails in all but the southern border region of the country, which has been populated beginning in the late 19th century by mainly Hindu settlers of Nepalese origin, officially styled *Lhotshampa* ('southern border people').

More than 20 languages are spoken in Bhutan, all belonging to the Tibeto-Burman family except for Nepali, which is Indo-Aryan. The secular education system, after briefly adopting Hindi, has used English as the medium of instruction since 1964, with Dzongkha taught for one hour daily. The teaching of Nepali in schools in the south of the country was discontinued in 1989. The Bhutanese Broadcasting Service broadcasts radio programs in Dzongkha (about 40%), English, Sharchopkha, and Nepali. The national weekly newspaper, *Kuensel*, appears in English (about 12 000 copies), Dzongkha (3000), and Nepali (300). In the national assembly, debates are conducted in Dzongkha, with translation available into Nepali.

Names

Ethnic names in Bhutan are often derived from place names, with the suffix *-pa*. This suffix and the feminine *-ma* are characteristically reduced to *p* and *m* in Dzongkha and added to the previous syllable, displacing the original final. Language names are compounded with words for language: Dzongkha *ke* (WT *skad*), Bumthang *kha*, Sharchop *lo*.

The terms *Bhotia* and *Monpa* often found in the literature are too imprecise to identify any particular group. Bhotia, from WT *bod* 'Tibet', is a general Indo-Aryan term for Tibetans or for Himalayan peoples taken for Tibetans. Monpa (*Menba* in

Bhutan is a Buddhist kingdom located in the Himalaya east of Nepal. It is bordered by the Tibetan Autonomous Region of China on the north and northwest and by India on the south and east. Its population is about 750 000.

Much of Bhutan's culture is shared with Tibet, although with local particularities. The indigenous name of the country, Druk yul (*'brug yul* 'dragon country' in Written Tibetan (WT)), refers to the established religion, the Drukpa Kagyupa sect of Tibetan Buddhism. The national language, Dzongkha, is linguistically a dialect of Tibetan, that is, essentially a modern descendant of Classical Tibetan, which to Bhutanese is Choeke (see below) or 'Classical Dzongkha'. What is often called Drukpa culture traditionally prevails in all but the southern border region of the country, which has been populated beginning in the late 19th century by mainly Hindu settlers of Nepalese origin, officially styled *Lhotshampa* ('southern border people').

More than 20 languages are spoken in Bhutan, all belonging to the Tibeto-Burman family except for Nepali, which is Indo-Aryan. The secular education system, after briefly adopting Hindi, has used English as the medium of instruction since 1964, with Dzongkha taught for one hour daily. The teaching of Nepali in schools in the south of the country was discontinued in 1989. The Bhutanese Broadcasting Service broadcasts radio programs in Dzongkha (about 40%), English, Sharchopkha, and Nepali. The national weekly newspaper, *Kuensel*, appears in English (about 12 000 copies), Dzongkha (3000), and Nepali (300). In the national assembly, debates are conducted in Dzongkha, with translation available into Nepali.

Names

Ethnic names in Bhutan are often derived from place names, with the suffix *-pa*. This suffix and the feminine *-ma* are characteristically reduced to *p* and *m* in Dzongkha and added to the previous syllable, displacing the original final. Language names are compounded with words for language: Dzongkha *ke* (WT *skad*), Bumthang *kha*, Sharchop *lo*.

The terms *Bhotia* and *Monpa* often found in the literature are too imprecise to identify any particular group. Bhotia, from WT *bod* 'Tibet', is a general Indo-Aryan term for Tibetans or for Himalayan peoples taken for Tibetans. Monpa (*Menba* in

Chinese transcription) is a Tibetan term for non-Tibetans on the southern periphery of Tibet; in Bhutan it is used to refer to several different groups and is found in a traditional Tibetan name for Bhutan itself, *lho-mon* 'southern Mon (country)' (or perhaps 'southerner [i.e., southern Tibetan] and Mon [country]'). Another term used to identify several groups is WT *'brog-pa* (Dzongkha *bjop*), which properly identifies the pastoralist lifestyle and not a particular group or language variety.

Languages

Parts of this section are based on a survey of Bhutanese languages by van Driem (1998).

Dzongkha, the National Language

The national language, Dzongkha, Lho-ke (WT *lho-skad* 'southern language') in older literature, is a standardized version of the language of the Ngalop, the dominant ethnic group in western Bhutan. Traditionally it is the language of the court and of the administrative/monastic fortresses, or *dzongs* (whence its name). In other parts of the country, it was traditionally limited to members of local elites and to those who had contact with the dzongs or with large monasteries, but it is gradually becoming more widely known through schools, videos, cinema, and popular songs.

Written Dzongkha and *Choeke* Classical Tibetan (WT), whose primary importance as a liturgical language is reflected in its Bhutanese name Choeke (WT *chos-skad* 'religion-language'), traditionally served as the written counterpart of spoken Dzongkha. Its reading pronunciation is based on that of modern Central Tibetan, and many of these pronunciations have found their way into spoken Dzongkha, particularly in cultural vocabulary. In secular use, it remains the language of the Bhutanese legal code and of some official documents.

The creation of Modern Written Dzongkha, based on the spoken language, to replace Choeke in secular use was announced in 1961 as part of Bhutan's first five-year plan. An orthography was devised, and a grammar presenting the new standard was published in Choeke in 1972. The Dzongkha edition of *Kuensel* adopted the new standard in 1978. The development of Dzongkha has been promoted by the Dzongkha Division (and its successors) in the Education Ministry since 1971. This division produces textbooks, dictionaries (monolingual, 1993; Dzongkha-English, 2002), and computer software and encourages the use of Dzongkha in official documents. It also conducts some research on other Bhutanese languages.

The written Dzongkha standard takes into account spoken Dzongkha grammar, syllabification, and certain other features, but it also conserves many elements of Choeke spelling that are not pronounced. Like Choeke, it is written in Tibetan script, either in the capital-letter style (WT *dbu-can*) or in the indigenous Bhutanese semi-cursive Joyig (WT *mgyogs-yig*).

Other Tibetan Dialects

Official Dzongkha is based on the dialect of the capital, Thimphu, and Punakha; other, quite distinct Dzongkha dialects, from west to east, are those of Ha, Paro, and east of Thimphu, Wangdue Phodrang. A closely related language, called Chocha-ngacakha (also Tsamangkha or Kurmepkha 'lower Kuri valley language') is spoken in an enclave in the east between the Lhuntse and Monggar districts. Dzongkha belongs to the Southern Tibetan dialect group, which also includes Denjongke ('rice-district language') in Sikkim and Tromowa (Groma) in the Chumbi Valley of Tibet, west of Bhutan. Dzongkha and modern Central Tibetan are not intercomprehensible.

No precise information is available on the dialects of Tibetan spoken by pastoralist nomads (WT *'brog-pa*, Dzongkha *bjop*) in northern Bhutan in Lingshi, Laya, and Lunana, or on Brokkat ('pastoralist-language'), spoken by settled ex-nomads at Dur in Bumthang; Lakha ('mountain language'), spoken by Bjop in Wangdi-Phodrang; or Brokpa (Brokskat), spoken in Mera and Sakteng in the east.

Bumthangkha

The language of Bumthang district in Central Bhutan, east of the Pele-la, is mutually intelligible with the languages of Kheng to the south and of Kurtoe ('upper Kuri valley') to the northeast. Chalikha, spoken north of Monggar in eastern Bhutan, Henkha (also Nyenkha or Mangdekha), spoken near Tongsa, to the west of Bumthang, and Dzalakha (or Khomakha), spoken in northeastern Bhutan, probably all belong to the same linguistic group.

Tshangla or Sharchopkha

Tshangla (the indigenous term) or Sharchopkha ('easterner language'), spoken in the densely populated southeastern quarter of Bhutan, serves as a lingua franca in eastern Bhutan. The same language is spoken just across the border in the Indian State of Arunachal Pradesh, where it is known as Central Monpa (Tshangla), and in Tibet by a longstanding Bhutanese émigré community in the Pemakoe (WT

padma-bkod) region some 400 km northeast of Bhutan. The language of the latter group has been described in Chinese under the names Cangluo Menba (Tshangla) and Motuo Menba (Tshangla).

Dakpa

Near the eastern border, the Dakpa speak a non-Tibetan language which in Arunachal Pradesh is known as Northern Monpa and in the Tibetan region of Tshona as Cuona Menba. This language appears to be close to Bumthangkha. The name (Written Dzongkha *dwags-pa*) does not imply any relation to the Tibetan region of Dwags-po.

Minor Groups

Three groups speaking distinct Tibeto-Burman languages are identified by van Driem as aboriginal remnants: Lhop, or Doya, in an enclave in south-western Bhutan; Gongduk, near Monggar (eastern Bhutan); and Ole (also often called Monpa, and now called 'Black Mountain' by van Driem), in a few villages south of Tongsa (central Bhutan).

Nepali

Bhutanese of Nepali origin speak an eastern variety of standard Nepali similar to that of the Darjeeling district in India. Basic knowledge of this language is widespread in Bhutan. Immigration of Nepali speakers has been halted in recent years, and residents declared to be illegal were expelled in the early 1990s.

The scriptures of the Christian faith were soon called by the Greek name *biblia*. Originally neuter plural, meaning 'books,' the word over time was taken to be feminine singular (presumably as the 'books' began to be taken to form a single entity). From about the 2nd century A.D., the Christian scriptures were taken to consist of two parts: 39 books of the Old Testament (i.e., the Jewish scriptures; *see* **Judaism** and **Hebrew, Biblical and Medieval**) and 27 books of the New Testament (i.e., works arising from the new movement centering on Jesus).

Old Testament

A striking feature of the Old Testament is its tremendous diversity, as might be expected from writings compiled over a period of several hundred years.

There is a diversity of genre: legend (Genesis 1–9), narrative (1 and 2 Samuel, 1 and 2 Kings), genealogy (1 Chronicles 1–9), prophetic verse (much of Isaiah), liturgical verse (Psalms), law and regulations (Exodus 20–40, Leviticus, Deuteronomy), maxims (Proverbs), love poetry (Song of Solomon), and apocalyptic (Daniel 7–12). Of course, there are passages that belong in more than one of these genres.

There is also some diversity of content. Earlier emphasis on the laws and rituals of the tabernacle (and later the Temple) is to some extent apparently contradicted by the teaching of the immediately preexilic prophets: in Exodus 30, Aaron and his successors are commanded by God to burn incense on the altar every morning and every evening, whereas Isaiah 1 has God saying, "Your incense is detestable to me." Postexilic prophets return to the emphasis on ritual: In Malachi 1:11, God again commands the burning of incense, but in a more universal framework: "In every place incense will be brought to my name, because my name will be great among

padma-bkod) region some 400 km northeast of Bhutan. The language of the latter group has been described in Chinese under the names Cangluo Menba (Tshangla) and Motuo Menba (Tshangla).

Dakpa

The scriptures of the Christian faith were soon called by the Greek name *biblia*. Originally neuter plural, meaning 'books,' the word over time was taken to be feminine singular (presumably as the 'books' began to be taken to form a single entity). From about the 2nd century A.D., the Christian scriptures were taken to consist of two parts: 39 books of the Old Testament (i.e., the Jewish scriptures; *see* **Judaism** and **Hebrew, Biblical and Medieval**) and 27 books of the New Testament (i.e., works arising from the new movement centering on Jesus).

Old Testament

A striking feature of the Old Testament is its tremendous diversity, as might be expected from writings compiled over a period of several hundred years.

There is a diversity of genre: legend (Genesis 1–9), narrative (1 and 2 Samuel, 1 and 2 Kings), genealogy (1 Chronicles 1–9), prophetic verse (much of Isaiah), liturgical verse (Psalms), law and regulations (Exodus 20–40, Leviticus, Deuteronomy), maxims (Proverbs), love poetry (Song of Solomon), and apocalyptic (Daniel 7–12). Of course, there are passages that belong in more than one of these genres.

There is also some diversity of content. Earlier emphasis on the laws and rituals of the tabernacle (and later the Temple) is to some extent apparently contradicted by the teaching of the immediately preexilic prophets: in Exodus 30, Aaron and his successors are commanded by God to burn incense on the altar every morning and every evening, whereas Isaiah 1 has God saying, "Your incense is detestable to me." Postexilic prophets return to the emphasis on ritual: In Malachi 1:11, God again commands the burning of incense, but in a more universal framework: "In every place incense will be brought to my name, because my name will be great among

the nations." Such differences often reflect differing contexts, especially differing situations facing the people of Israel, and differing attitudes among them.

Languages

In contrast, the choice of language shows little diversity: Almost the whole of the Old Testament is in Hebrew. Up to about the 6th century B.C., Hebrew was the mother tongue of the whole Israelite community. From the time of the two exiles (723 B.C. and 597 B.C.), the community became much more scattered: the 'diaspora' (= dispersion) extended as far east as Iran and into Egypt, Asia Minor, Greece, and Italy in the west. Many communities of the diaspora adopted other languages as their mother tongue, especially Aramaic and Greek.

Aramaic was closely related to Hebrew. Jacob's father-in-law Laban had spoken an early form of it (Genesis 31.47). By the 8th century B.C., it had become the language of diplomacy in the Middle East, and from the late 6th century, Aramaic became the mother tongue of many Jews living in Palestine (*see* **Aramaic and Syriac**). However, as stated above, the overwhelming majority of the Old Testament is in Hebrew. Just a few passages are written in Aramaic: much of Ezra chapters 4–7, much of Daniel chapters 2–7, and Jeremiah 10.11.

Aramaic-speaking Jews needed help to understand the Hebrew scriptures, and this was provided by means of the Targums (Aramaic for 'translations' or 'interpretations'). These tended to go beyond being strict translations and to contain much interpretative material to facilitate understanding.

Although Greek and Hebrew took their alphabets from a common source (Phoenician), the two languages are not at all closely related. The many Jews of the diaspora who took on Greek as their mother tongue, thus very much needed a Greek translation of the Hebrew scriptures. Such a translation was in fact made in Egypt in the 3rd century B.C. Legend has it that the king of Egypt commissioned 72 elders of the Jewish community to carry out this work and that they completed it in 72 days. The translation was for that reason called the Septuagint (Greek for 'seventy'; for more on the Septuagint, *see* **Bible Translations: Ancient Versions**). This version was of extreme importance in early Christianity (see below).

Canon

Judaism recognises three subdivisions within the Old Testament: (1) the Torah (the first five books of the Old Testament), (2) the Prophets (Joshua, Judges, 1and 2 Samuel, 1 and 2 Kings, Isaiah, Jeremiah, Ezekiel, the 12 Minor Prophets), and (3) the Writings (all the remaining books, including the Psalms).

The Canon of the Old Testament (i.e., the list of literary works agreed as authoritative by the Jewish leaders) was finally established some time during the 1st or 2nd century A.D. At the time of Jesus (i.e., 50 to 100 years before the fixing of the Canon), there was universal agreement on the authority of the Torah; most Jews (the notable exception being the Sadducees) accepted the Prophets; but there was less agreement about the Writings (though everyone accepted the Psalms).

Many manuscripts of the Greek Septuagint contain several books not found in the Hebrew original: These books are referred to as 'Apocrypha' (Greek 'things hidden away' – though most of the books have never been in any sense secret). Although some Jewish authorities had been ready to accept them among the Writings, the books of the Apocrypha were excluded from the fixed Canon.

However, because the early Christian church treated the Septuagint as the authoritative form of the Old Testament, the books of the Apocrypha have been treated by Catholic and Orthodox churches as having equal authority with the books recognized by the Jews. Protestants, on the other hand, have followed the Jewish Canon and assigned them secondary status.

Relationship between the Old Testament and the New Testament

The question might well be asked: Why do the Christian scriptures incorporate the Jewish scriptures?

First, it is clear from the gospels that the Jewish scriptures held great authority for Jesus; his first disciples followed him in this. In fact, at the very beginning of the Christian era, when Christians spoke of 'the scriptures' they meant *just* the Jewish scriptures.

A second reason for the place of the Jewish scriptures in Christianity is the perceived importance of the many events in the life and work of Jesus that were held to be fulfilments of Old Testament prophecies (*see* **Prophecy**).

New Testament

The New Testament exhibits considerably less diversity of genre than in the Old Testament (the time scale is much shorter: about 50 years separate the earliest documents from the latest). The genres include narrative (a good deal of the Gospels and Acts), teaching (Matthew 5–7, the whole of Paul), apocalyptic (Revelation), and genealogy (in two passages only: Matthew 1 and Luke 3).

The whole New Testament is written in Koine Greek, a kind of lingua franca of the Eastern Mediterranean area at the time. The frequent quotations from the Old Testament are taken from the Septuagint, which at quite a number of points reads differently from the currently accepted Hebrew text.

There is some diversity of style within the language: Some books are written in a Greek akin to Classical (Attic) Greek (e.g., the Epistle to the Hebrews), but others are in a style rather more influenced by Semitic languages (Hebrew or Aramaic). Most of the epistles were written down by amanuenses from the dictation of the composer, which too would account for some stylistic differences.

The gospels, although written almost entirely in Greek, very occasionally quote Jesus's words in Aramaic, notably his words on the cross *Eloi, Eloi, lama sabachthani* ('My God, my God, why have you forsaken me?' Mark 15.34). This clearly indicates that Jesus spoke Aramaic as his mother tongue. Other examples (e.g., Mark 5.41: *talitha cum* 'Little girl, get up') would suggest that Jesus taught and ministered in Aramaic. Some place names (e.g., Mark 14.72: *Golgotha*) also appear in Aramaic. In 1 Corinthians 16.22, writing mainly to non-Jewish Christians, Paul uses the Aramaic expression: *maran atha* 'Come, Lord'; this suggests that, at this stage in the growth of the early church, such Aramaic tags were in general use.

Religious technical terms in Hebrew appear in the text occasionally; for example, Mark 7.11: *corban* 'votive offering to God.'

The New Testament exhibits some diversity of content: Paul and Jesus speak and teach very differently from one another. This can be partly accounted for in terms of the very different contexts in which they worked: Jesus living almost entirely among Jews in Palestine and closely supervising a single group of disciples within the limits of Palestine, Paul traveling around Asia Minor and Greece setting up churches among Gentiles. Paul v. James (substantive differences of emphasis). Matthew, Mark, and Luke's gospels have much in common with each other, but are quite different in emphasis from John's gospel. The epistle of James (2.14–26) seems to attack Paul on the place of faith in salvation; even if James is in fact attacking a commonly found misinterpretation of Paul rather than Paul's actual teaching, there are indications that James and Paul differed quite fundamentally on a number of issues.

Specifically, Christian scriptures appeared only when the first generation of Christian leaders (men who had known Jesus personally, including members of the group of 12 apostles) began to die (about 60 A.D.). A reliable record of what Jesus had said and done was seen to be essential for the church, and a number of writers set out to produce such accounts. About this time, material already produced by recognized Christian leaders (e.g., the epistles of Paul and others) also began to be gathered together. Paul's earliest epistles date from about 50 A.D.

The New Testament Canon

The Canon of the New Testament was established some time during the 2nd or 3rd centuries A.D. Early in the 2nd century, general agreement had been reached among the different churches that what we have as the four Gospels and Acts were the most powerful and authoritative accounts of the beginning of Christianity.

It was perhaps the heretic Marcion who was the chief catalyst in the process of establishing the Canon. About the middle of the 2nd century, he challenged the growing acceptance of certain writings. To begin with, he rejected the whole of the Old Testament, claiming that the God of Jesus was a God of love, a totally different being from the God of the Old Testament. He also claimed that, of the Christian apostles, only Paul had realized the great gulf between Law and Gospel. From the body of New Testament writings that were becoming influential in the church, Marcion therefore accepted only 10 epistles of Paul and a modified version of Luke's gospel.

The church now saw the need for finally defining which writings were authoritative. The principal criterion used seems to have been a clear connection with the first apostles; a good deal of weight was also given to how strong a particular book's influence had been on congregations. There was substantial agreement among the churches and their leaders that the four Gospels, Acts, and the epistles of Paul had equal authority with the Old Testament; however, for a period there was doubt about the authenticity of certain books, such as Hebrews, 2 Peter, 2 and 3 John, Jude, and Revelation. Certain other works, such as the Epistle of Barnabas and the 'Shepherd' of Hermas, were admitted by a few churches, but eventually were excluded from the generally agreed Canon.

Inclusion within the Canon was taken to imply that a work was inspired by God (2 Timothy 3.16: Greek *theopneustos* 'God-breathed'; *see* **Inspiration and Revelation**).

Bible Translation into Lesser-Known Languages

F Boswell, Summer Institute of Linguistics, Dallas, TX, USA

Introduction

The translation of the Bible began around 200 B.C. with the version known as the Septuagint. Jerome completed the Latin Vulgate translation in A.D. 405, and it became the authoritative translation for Roman Catholicism for more than 1000 years. The Scriptures were first translated into Chinese in the 7th century, into Arabic in the 8th and 9th centuries, and into Persian in the 14th century. Most translation work occurred in Europe, ranging from translations into Georgian and Armenian in the 5th century to translations into Dutch in the 12th century and Spanish in the 13th century. In the 14th century, a team led by John Wycliffe produced the first English translation. Momentum continued building throughout Europe, led by such notable figures of church history as Martin Luther, whose German translation was completed in 1534.

Translations into Lesser-Known Languages: Missionary Movements

After the European impetus began, Bible translation spread along with the missionary movement, fueled by the invention of the printing press in the mid-15th century. The Gospel of Matthew was published in Malay in 1609, and John Elliot completed a translation of the entire Bible in 1663 for the native peoples, who spoke the Massachusetts language. Others picked up the task, including William Carey, who helped translate the Bible into 20 languages of India. The British and Foreign Bible Society was formed in 1804 to facilitate the growing number of missionary translation efforts. By the end of the 19th century, translations were available in 621 languages.

Although translations into major languages cover much of the world's population, questions remain on how to provide access to the Scriptures for members of the lesser-spoken languages. William Cameron Townsend met this challenge in the early part of the 20th century. While working as a Spanish Bible salesman in Guatemala, he was confronted by a Cakchiquel-speaking man who asked, "If this God of yours you are talking about is so wonderful, why doesn't He speak my language?" Townsend determined that the speakers of this language should also have the Scriptures, and despite numerous challenges, he finished a New Testament translation in Cakchiquel in 1928.

Townsend shared his vision for translation of the Scriptures into the languages of the central Americas, and he soon mobilized scores of men and women to take up the task, forming an organization known as the Summer Institute of Linguistics (now known officially as "SIL"). A young scholar named Kenneth Pike began work among the Mixtec of Mexico in 1935 and eventually became one of the leading linguistic authorities in the world. Eugene Nida began with SIL before joining the American Bible Society in 1943; he became the world's leading translation theorist.

Although translation has been widespread into the major languages of the world, including of course those that are at least distantly related to the main

Inclusion within the Canon was taken to imply that a work was inspired by God (2 Timothy 3.16: Greek *theopneustos* 'God-breathed'; *see* **Inspiration and Revelation**).

biblical languages of Greek and Hebrew, translation into the lesser-known languages of the world has been increasing dramatically through the work of personnel in organizations such as Wycliffe Bible Translators, SIL, and member organizations of the United Bible Societies (UBS).

Overview at the Beginning of the 21st Century

At the beginning of the 21st century, the following figures reflect the current status of Bible translation efforts into the world's languages. According to the Ethnologue (15th edition), which is a comprehensive listing of the languages of the world, including data on many particulars for each language, such as language family classification, number of speakers, geographical location, and need for Bible translation, there are 6912 languages in the world. The United Bible Societies reported in 2003 that some or all of the Bible has been translated into 2355 languages. Of these languages, 414 have an adequate Bible, 1068 an adequate New Testament, and 873 have at least one book of the Bible (Table 1).

In addition, the total number of languages in which Bible translation is in progress worldwide is 1678, of which 1410 are deemed to be in languages lacking an adequate translation. The number of languages in which no translation project has begun is 2644, which covers an estimated population of 147 million.

Comments on Areas of Greatest Concentration

Approximately 60% of the world's remaining need for translation into lesser-known languages is found in three major geographical areas: Papua New Guinea and the Indonesia archipelago, East Asia, and central Africa plus Nigeria. Papua New Guinea holds the distinction of being the country with the largest number of identified languages (812), perhaps as many as 400 of which are still in need of translation work.

SIL, whose members are currently working in 1376 languages, adopted at the turn of the century a bold thrust known as Vision 2025. Simply stated, Vision 2025 focuses on seeing a Bible translation program at least started by the year 2025 in every language of the world that needs one. To accomplish this will require a radical quickening of the pace for entering programs, ramping up the number of new starts to approximately two every week. The enormity of Vision 2025 becomes clearer when contrasting the figure for new starts with the previous high point of new translation program beginnings, which took place in the year 1992. New starts were reported worldwide that year in 25 language programs, or an average of almost one every 2 weeks. Since adopting Vision 2025, SIL International reported that from 1999 to 2004, 356 new Bible translation programs began. This was the highest number during any 4-year period in history, averaging one new start every 5 days.

Basic Challenges of Bible Translation and Communication

The communication of meaning from one language to another is complicated by many factors. In discussing issues of translation into lesser-known languages, many obvious hurdles immediately come to mind. For example, how does one communicate the effect of the Apostle Paul experiencing shipwreck, when the audience receiving the translation in Saharan Africa has never seen nor experienced life near a sea? This dilemma is quite common. However, other factors also complicate the process, including sociolinguistics, lexical challenges, grammatical intricacies, and presentation of background information.

Sociolinguistics

Sociolinguistic matters often surface quickly in the implementation of a Bible translation program. For example, decisions must be made regarding various important biblical terms. The difficulty revolves not just around making the appropriate decisions between two or more terms and any semantic overlap involved but also in agreement and buy-in among the Christian community (if indeed there is such a community among the receptors of the translators). Difficulty arising from sociolinguistic decisions can be seen in recent translation efforts in a major translation project in Asia, where two different words for God have

been used in parallel translation efforts. Different translation teams argue for their chosen term on the basis of its historical significance as opposed to current usage, underlying assumptions regarding its non-Christian usage, and cultural ramifications.

In the Sa'a language of Solomon Islands, two different dialects are represented, and each dialect is populated primarily by one denomination. Each denomination has used different terms for 'cross,' which is obviously an important term in the New Testament. Choices for which term to use are sociolinguistically oriented, as one term might alienate one denomination and prejudice them from using the translation. If so, another translation might be needed that is denominationally accepted. Translation committee members and decision makers need to be confident that a compromise solution will be acceptable to a majority of speakers. This type of issue must be resolved for the translation to be successful.

Lexical Challenges

Basic challenges of finding the right word to include in the receptor language translation often revolve around unknown terms, such as boats used by the Apostle Paul, camels referred to in Genesis, olive trees populating the hill near Jerusalem, and sheep that are used by Jesus in a teaching situation. Houses are obviously known throughout the world, but the flat-roof houses of biblical times must be represented in the translation so that language community members can understand Jesus' prohibition against going down from the roof to take anything out of the house during times of trouble (Matthew 24:17). Without adequate background and understanding, readers will be confused, because in many cultures, people go on to the roof of their houses only to repair them, not to carry out daily activities in a usable living space.

References used for the spirit world require particular care and investigation. In using a word to communicate the meaning of 'angels,' for example, questions to be considered include: Is there a concept of angels at all? Are angelic appearances and visitations common, or something merely known through Scripture? Is the term that translates 'angels' one that is in common use? Is the chosen word a transliteration of a major language word, or specific to the receptor language? Similarly, how are the concepts of 'demons' expressed? The translator must determine whether the suggested term is used to express 'spirits of people who have died,' and whether or not associated connotations of the term include a reference to evil activity. If not, that connection will have to be expressed explicitly.

Titles of Christ have generated controversy recently in several places in the Middle East, as translators have grappled with a suitable rendering of 'Son of God.' At issue have been the implications of the use of the term; namely, that a literal rendering of 'son of' implies that sex was involved in the generation/birth of Jesus. As such, many translators feel that the phrase should be avoided and a meaningful representation used instead that expresses the relationship, purpose, and function associated with the term. Others have argued that the form used by the biblical authors was divinely inspired and thus should be used without apology. Compromises and alternative solutions are not easily found, as the chosen term is regarded as crucial to faithful and accurate translation.

Theological concepts including 'grace,' 'forgiveness,' and 'repentance' require special care. The translator must determine the range of meaning used in the New Testament and decide which choice would be appropriate in the passage being translated. This is done with an awareness that often the meaning represented in these terms varies in the Scripture, depending on context, genre, author, and purpose.

Theology is a powerful force in translation. Receptor language deviations from established lexical expectations can lead to fairly harsh responses. For example, in a major translation project in South Asia, copies of a new common-language translation were burned in 1980 and 1981. Foreign Christians in that country who were knowledgeable about *Today's English version* felt that the local translation had 'fallen into a similar pit' as the *Today's English version* by removing overt references to the blood of Christ, choosing instead to render those passages by meaningfully expressing the purpose of his death. Thus, the local translation was accused of reducing the effect of the passages that teach the atonement of Christ. Although the translators felt that they were helping the readership with their approach, this was theologically unacceptable to several people of influence, and thus the books were permanently removed from any prospect of circulation.

An inventory of color words is often in short supply in a language. This poses a particular difficulty in Bible translations in such passages that, for example, delineate the colors of thread used in the making of the Tabernacle, or the colors of the stones in Revelation. The same can be said for numbers. Some languages of Papua New Guinea, such as Kewa, have an elaborate numbering system, using different points of the arm and face as numerical reference points, with some 47 body parts enumerated. However, another language in the same country has only three vernacular number designations: 'one,' 'two,' and 'everything

else.' Solutions to this translation problem often include borrowings from a national or regional language, which in the case of Papua New Guinean languages might include some form of Tok Pisin.

Delineations of birth order among siblings can also present interesting challenges. In many languages, for example, there is no one word for 'brother.' The concept of 'brother' cannot be expressed apart from a designation of older or younger brother. Similarly, in regard to kinship terms, one linguist in Ecuador reported recently his consternation at trying to represent the term for cousin. He reported that there were 16 different words for cousin, but none of those were generic enough to match the concept expressed in Paul's letter to Colossae, "Mark, the cousin of Barnabas" (Colossians 4:10).

Likewise, concepts of time, such as the expression of 'month' or 'year,' are sometimes not easily expressed in languages with a single term, but are tied to natural phenomena such as the ripening cycle of a particular fruit or nut tree. Likewise, unfamiliar quantity measures, such as the Hebrew 'bekah,' are first calculated in terms of a local language substitute and then perhaps rendered in the translation with a national language word related to kilogram.

Careful consideration is also given to taboo words, or words that are prohibited from being read publicly. Even though translators are able to employ readily appropriate expression of certain concepts, such as circumcision or a description of the woman "with an issue of blood" (Leviticus 12:7, Luke 8:43), more than one local language Bible translation committee has determined that the reading of these terms in public could be considered scandalous. The resulting reaction could cover a scale from failure to utter this term during a public reading to the nonuse of the translated Scriptures by a language community. In certain extreme cases, action might even be taken against the translators, and the published books might be removed from circulation. In more than one place, this removal has been through public burning.

Grammar

It is safe to say that thousands of pages of comments could easily be written about grammatical issues and their effect on Bible translation. The following examples are merely representative. Untrained, beginning translators often reproduce the form of the source text in terms of sentence length, word order, and position of vocatives in sentences. Only when these translators develop in their skill and experience do they begin to make natural adjustments for the receptor language. A simple example from Ephesians 1:3–10 highlights possible adjustments needed to sentence length. The Greek New Testament renders these verses as only two sentences. However, many lesser-known languages need to express this information in several sentences, as is done in English in the New Living Translation, which uses nine sentences to render these verses. This translation approach is an attempt to distribute the information load in a meaningful fashion without being tied closely to forms of the original.

In terms of word order, Hebrew is generally recognized as a VSO language; that is, one in which the verb is often in first position in the sentence, with the subject and object following. New Testament Greek, however, is generally recognized as an SVO (subject, verb, object) language. Word order differences are caused by many factors. Among these are prominence, statement type, and participant reference. The translator must discover first the intent of any word order variations and how the corresponding function is expressed in the receptor language. One will note that even though Hebrew and Greek have different word order types, the translator must determine how to render effectively word order signals into the receptor language.

The representation of direct speech varies by language. Linguists working in Munduruku of Brazil reported that there were no natural language examples of indirect speech. Thus, the New International Version text of Genesis 29:12, "He had told Rachel that he was a relative of her father and a son of Rebekah," would have to be rendered with a form of direct speech: "He had told Rachel, 'I am a relative of your father and a son of Rebekah.'" These adjustments can be quite cumbersome for translators.

Rhetorical questions, which are extremely common in the New Testament and particularly in Paul's Corinthian letters, are not easily handled in many languages. The reason for this is that New Testament Greek employs rhetorical questions for several different functions and purposes. The receptor language, however, may only use one of those functions, such as scolding. Therefore, for the translator to mirror the form of the Greek with a question will lead to inaccurately communicated meaning. Instead, a declarative statement will have to be used to deliver the true meaning.

Recent controversies in the United States and Britain regarding inclusive-language translations in English are for the most part nonissues in hundreds of the world's languages. The reason for this is that the pronoun systems of many languages do not reflect the narrow inventory of pronouns used in English. For example, Cheke Holo of Solomon Islands employs six different first-person plural pronouns. Three of those used for the term 'we' include the person being addressed in conversation, and three of

them exclude those addressed. This reflects the common designation in Austronesian languages of inclusive and exclusive pronouns. The other distinctions in this set include two, three, or more than three persons being referred to by the pronoun. Cheke Holo also uses eight different pronouns for third-person plural 'they.' The designations include whether or not men or women are speaking or being spoken to, and how many within the set of plural are being referred to (namely, two, three, or more than three).

Grammatical obstacles range far above lexical and sentence-level considerations to the discourse level, as Robert Longacre has described in his many publications, including his definitive work, *The grammar of discourse*, and in the application of his theory to biblical texts in *Joseph*. The translator must know how subjects once identified in a discourse are to be identified in subsequent occurrences in the story. This means that once Peter is identified by name in Acts 2, will the local language allow him to be repeated by that designation in natural storytelling, or will a pronoun set obligatorily be used? If a pronoun is used, is there any limit as to how many times it can be used in a discourse? The successful translator grapples repeatedly with this type of question.

The same can be said for verb tenses. In some languages the time of action is marked at the beginning of a discourse and then not repeated, though some languages might need the tense marker to be repeated throughout the passage. The repetition of the marker might signal different reasons and responses for the reader. Obviously, this is discovered through extensive language investigation, and the representation of these features in a natural way is often regarded as a key step toward a truly communicative translation.

Background Information

One of the biggest challenges for translators of the Scriptures into lesser-known languages is how to deal with the background information needed to ensure successful communication of the scriptural message. Linguists working among the Dumagat of the Philippines reported that the receptor audience could not easily assimilate the intended meaning of the translated text because they were not familiar with the cultural information of biblical times (even balking at such basic concepts as shepherd), which distracted them from grasping the intended message of scriptural passage. For the Mamainde of Brazil, SIL linguists commented on a similar situation. The local speakers could easily get distracted in reading or hearing the passage about the burial of Jesus because they would wonder why a person would be buried in a cave, and why a stone would be rolled in front of it. Presentation of those facts could cause the hearers to miss the implications of Jesus' death. So, the translator wrestled with how to present this information, commenting that an adaptation would better suit the language community than a product strictly called a translation. Thus came about the development and implementation of bridging strategies, in which vernacular teaching materials and a system for presenting background information are a necessary part in the planning of a language program.

For example, SIL linguists working among the Adioukrou of Côte d'Ivoire reported that readers were missing key, intended information in stories related to the unseen world. Through controlled experiments, the Adioukrou were able to connect with the reality of the biblical world by the use of common receptor language terms. Among devices that helped supply necessary background information for accessing contextual meaning for certain narratives, they found that footnotes were quite effective.

The Future of Bible Translation

Shifts in Theory

Wilt (2003) and Gutt (2000) describe shifts taking place in translation studies, as the effects of advances in related disciplines are measured. Gutt particularly concentrates on strides made in communication studies, and his findings have great implications for the translation practices for lesser-known languages. He has shown extensively how the effect of the study of inferential communication and cognitive effects will cause translators to consider ways of adjusting the hearer's understanding. In previous practice, these kinds of gaps were often automatically bridged by placing background information explicitly into the translated text, but these kinds of adjustments are not always the most useful or faithful to the canon, and so other strategies are considered. Among these strategies are the implementation of extensive and intentional helps, including detailed marginal notes and study aids. Explication within the text is still used, but within tighter and more justifiable theoretical boundaries.

Shifts in Classification

In discussing types of translation into lesser-known languages, reference is often made to the classic scale proposed by Beekman and Callow, which classified translations ranging from highly literal to unduly free. Nida first used the term "dynamic equivalence" to describe meaningful translation, signifying that the translation was to evoke the same response in the

receptor language group that it did among the original hearers. Later, he employed "functional equivalence" to indicate that the meaning of the original communication was clearly expressed, as opposed to "formal equivalence," which was an attempt to represent the forms of the biblical source text in the receptor language.

However, recent presentations by translation consultants in SIL indicate that one might profitably consider a scale of adaptation based on receptor audience need for contextual background. That is, translations or adaptations are classified according to the degree of adaptation, thus providing the translator the necessary latitude to blend into the text the background information needed by the contemporary audience. The inclusion of such information would be considered to be outside some boundaries of acceptable translation, as the biblical authors did not need to make such information explicit for the original audience. But, by thinking in terms of degrees of adaptation which legitimize different translation product approaches for different types of audiences, various context-building and bridging strategies can be usefully implemented in ways that were not previously allowed because of adherence to the Beekman-Callow scale of translation types.

If a language group requires significant amounts of information for context building, it is better to label such efforts as products derived from Scripture rather than stretching the term "translation" to try to include them, as the resulting product should not be confused with Scripture. This is advantageous because a translation team can benefit from the freedom to present the translated message in various stages of release. That is, rather than being tied in the initial release to a publication that necessarily reflects a canonical translation, or one that is recognizable in form and accuracy to an accepted source, the translation team can choose an adaptation within various degrees, all the while building biblical literacy for a receptor language group. This approach prepares the language group for a further translation effort – one that indeed can be classified as translation, and one that is recognizable as canonical, acceptable, and authoritative.

Delivery of Scripture

Storying Approaches for Oral Cultures Chronological Bible Storying, particularly as developed by the International Mission Board of the Southern Baptist Church, is increasingly employed in efforts to reach oral cultures. Claiming that 1.5 billion people will never learn to read and write, and that two-thirds of the world's population are functionally illiterate, the International Mission Board is endeavoring to implement a full array of translated stories into various cultures. Standard story sets and a common base text are chosen. These can then be translated and shared with a language group in an effort to build among them a biblical worldview by introducing basic facts, terminology, and the overall picture of redemptive history, though not calling this a Bible translation. Instead, this is a tool for building biblical literacy and bridging cultural gaps. The board is partnering with three other major mission agencies in the Epic Partnership, which is an attempt to share the Gospel message more effectively by laying the groundwork of easily understood stories translated into lesser-known languages.

Audio Many of the world's nonliterate population will never learn to read, because of factors ranging from lack of educational opportunities to lack of reading materials in the language. In light of this, strategies must be in place to assist nonreaders. Hosanna/Faith Comes By Hearing Ministries is one organization, for example, that works successfully in cooperation with those who translate, print, and distribute Scripture to reach an oral audience.

Video In addition to audio presentations on cassette and compact disk, video has been a powerful force among language communities, most notably through the Jesus Film movement of Campus Crusade for Christ. The film has been completed in 877 languages.

Internet The International Forum of Bible Agencies has developed a website for retrieving and viewing published scriptures in the world's languages. This site is intended to be a central and widely known repository that agencies can use to share their Scripture publication resources with a world readership.

Computer Enhancements

The personal computer has enabled a veritable revolution in the Bible translation world. Drafts of translated Scripture are easily entered, stored, and revised throughout the translation process. Though technological advances are still limited in many places, the number of translation teams that rely on handwritten and typewritten texts, and that depend on others to record their work, is rapidly decreasing.

Beyond simple word processing, personnel in SIL and United Bible Societies have collaborated on several breakthrough software programs that enhance translators' abilities to adequately translate Scripture. Translator's Workplace is an extensive library of ref-

erence materials specifically geared toward Bible translators, although because of copyright restrictions, it is only available to qualified individuals working in Bible translation. Whereas there are numerous commercial software programs available that provide multiple versions of Scripture and an extensive list of reference works, Translator's Workplace focuses on providing aids that are translator specific, such as the journals *Notes on Translation* and *The Bible Translator*, the *Translator's handbooks* of United Bible Societies, and major language translations such as Hausa, Tok Pisin, or Norwegian, which are useful as base texts for some translators but that are not readily found in most commercial programs.

The Biblical Analysis Research Tool is part of the Translator's Workplace suite of programs, although a commercial version is available to the public. The Biblical Analysis Research Tool enables the translator to analyze the biblical text in ways that heretofore have been impossible. These include adjustment of the layout of the biblical text on the screen to reflect discourse groupings or experimentation, links to lexical and grammatical helps, and user-defined tags that can be stored and accessed to reflect the analysis of data. The Biblical Analysis Research Tool features an interlinear gloss of the Old Testament done by SIL scholars and is based on syntactic and semantic considerations.

Paratext, which has primarily been developed by United Bible Societies, is a computer program designed for inputting Scripture translation on-screen, viewed parallel to a major language or biblical text version and limited reference tools. Recent enhancements to Paratext make it the premier software for translators to use in preparing their translations for typesetting and publication.

For many years, computer scientists with an eye toward Bible translation have wondered how the power of the computer can be leveraged to assist with transferring meaning from one language to another with greater ease than is traditionally seen (beginning from the usual starting point of initial exegesis followed by a first draft done by hand). Two software programs have been important in this realm of experimentation and implementation. One is the Computer Assisted Related Language Adaptation program, pioneered among closely related Quechua dialects of Peru. The computer processes a thorough morphological and syntactical analysis, and the rules arising from the analysis are applied from the source language to the related language output. Another program that enables computer transfer of biblical texts is Adapt It, recently developed by SIL linguist Bruce Waters in Papua New Guinea. It differs from Computer Assisted Related Language Adaptation in that it does not require the heavy investment of time and expertise in language analysis to be effective. Though much more than a lexical substitution program, this is a key feature of the program and one which reduces the time needed for translation from one related language to another.

Although these computer tools provide for a useful first draft, the users are cautioned that in no way is the initial output a publication-worthy draft. The use of either of these programs brings up new issues for translators and consultants, including considerations surrounding the related language base text used for the initial transfer. The reliability of that text must be determined. Also, the translators must consider the kind of checking that must be done on the outputted text, being aware of the large amount of necessary work remaining after first-draft generation by computer. These concerns must be considered carefully before work can proceed.

Partnership

One of the most encouraging movements in Bible translation in the 21st century is the emergence of the International Forum of Bible Agencies. It is estimated that 95% of the world's Bible translation projects are conducted under the auspices of at least one of these member organizations. At present, the Forum is an association of 25 major nonprofit organizations that cooperate in translation efforts to avoid unnecessary duplication of effort. The work of Bible translation and distribution has been enhanced by the spirit of mutual concern and cooperation, evidenced by the implementation of joint agreements regarding basic principles and procedures for translation and qualifications for translation consultants. Regional and national forums are forming and gaining momentum, and this kind of coordinated partnership pro-

mises to be a significant development in the future of Bible translation.

Bible Translations: Ancient Versions

T Edwards, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

The Septuagint (LXX)

The LXX is the Greek translation of the Hebrew Bible that originated among the Greek-speaking Jews of Alexandria. The legends surrounding the initial translation of the Pentateuch on the island of Pharos by seventy (-two) Jewish elders from Jerusalem in the 3rd century B.C. have spawned its name, despite only relating to the translation of the first five books (*Letter of Aristeas* 310–311; Philo *Life of Moses* 2: 25–42).

Various theories concerning its inception have been promulgated, yet no consensus has been reached. Many have seen the legends found in the *Letter of Aristeas* as containing elements of truth and have thus posited royal initiative (King Ptolemy II, 285–246 B.C.) behind its inception, while others have seen the liturgical needs of the Greek-speaking Jews of Alexandria as the reason, this latter theory being based on the premise that the Jewish populace could no longer understand the Hebrew Bible that was read each week in the Synagogue. More recently it has been suggested that the LXX arose amongst bilingual Jews who understood both Greek and Ancient Hebrew, and thus there was an educational focus behind its inception. In other words, the Greek translation of the Pentateuch was intended as an interpretive aid designed to bring the readers to the Hebrew text rather than the Hebrew text to the readers. The Greek text, therefore, was originally dependent upon the Hebrew and subservient to it. It is this latter option that perhaps best explains the origins of the LXX, yet such a relationship to the Hebrew does not best describe the development of the LXX in the subsequent centuries. Over time, the ability to understand Hebrew among the Greek-speaking Jews clearly waned, and therefore the LXX gradually became independent of the Hebrew original. Such a development initiated debate as to its relative merits and authority, with its detractors claiming that the original meaning of the Hebrew is lost in translation (prologue to *Ben Sirah*), whereas its supporters argue for the divine inspiration of the translation that is to all intents and purposes exactly like the original (*Letter of Aristeas* 310–311; Philo *Life of Moses* 2: 37–38). This debate was initially an intra-Jewish affair, but with the adoption of the LXX by the Gentile church, the early church fathers enthusiastically embraced the latter view of the divine inspiration of the LXX. Such a situation, alongside a desire to bring the Greek text closer in line with the Hebrew, led to various revisions of the Greek text by Jewish scholars.

mises to be a significant development in the future of Bible translation.

Bible Translations: Ancient Versions

The Septuagint (LXX)

The LXX is the Greek translation of the Hebrew Bible that originated among the Greek-speaking Jews of Alexandria. The legends surrounding the initial translation of the Pentateuch on the island of Pharos by seventy (-two) Jewish elders from Jerusalem in the 3rd century B.C. have spawned its name, despite only relating to the translation of the first five books (*Letter of Aristeas* 310–311; Philo *Life of Moses* 2: 25–42).

Various theories concerning its inception have been promulgated, yet no consensus has been reached. Many have seen the legends found in the *Letter of Aristeas* as containing elements of truth and have thus posited royal initiative (King Ptolemy II, 285–246 B.C.) behind its inception, while others have seen the liturgical needs of the Greek-speaking Jews of Alexandria as the reason, this latter theory being based on the premise that the Jewish populace could no longer understand the Hebrew Bible that was read each week in the Synagogue. More recently it has been suggested that the LXX arose amongst bilingual Jews who understood both Greek and Ancient Hebrew, and thus there was an educational focus behind its inception. In other words, the Greek translation of the Pentateuch was intended as an interpretive aid designed to bring the readers to the Hebrew text rather than the Hebrew text to the readers. The Greek text, therefore, was originally dependent upon the Hebrew and subservient to it. It is this latter option that perhaps best explains the origins of the LXX, yet such a relationship to the Hebrew does not best describe the development of the LXX in the subsequent centuries. Over time, the ability to understand Hebrew among the Greek-speaking Jews clearly waned, and therefore the LXX gradually became independent of the Hebrew original. Such a development initiated debate as to its relative merits and authority, with its detractors claiming that the original meaning of the Hebrew is lost in translation (prologue to *Ben Sirah*), whereas its supporters argue for the divine inspiration of the translation that is to all intents and purposes exactly like the original (*Letter of Aristeas* 310–311; Philo *Life of Moses* 2: 37–38). This debate was initially an intra-Jewish affair, but with the adoption of the LXX by the Gentile church, the early church fathers enthusiastically embraced the latter view of the divine inspiration of the LXX. Such a situation, alongside a desire to bring the Greek text closer in line with the Hebrew, led to various revisions of the Greek text by Jewish scholars.

The Three: Aquila, Theodotion, and Symmachus

The Greek translations of Aquila, Theodotion (both second century A.D.), and Symmachus (late 2nd/early 3rd century A.D.) are preserved, in part, in Origen's Hexapla. All three are clearly Jewish translations that display numerous links with rabbinic interpretations of scripture, with Aquila being quoted on numerous occasions in both Talmuds. Both rabbinic and patristic sources state that Aquila was a proselyte, although attempts to link him with the targumist Onkelos are not sound. Theodotion has been described as a Diaspora Jew, whereas Symmachus should be located in Caesarea of Palestine.

As hinted at in the preceding section, it appears that there are two probable reasons behind their inception: the adoption of the LXX by the Christian church and/or the desire to correct the LXX by bringing it closer in line with the Hebrew. This latter reason is particularly relevant for Aquila and Theodotion, who are very literal in their renderings of the Hebrew. Aquila took the literal approach to the extreme, possibly influenced by the teaching of R. Akiva on the divine significance of every letter of the scriptures, and even translated the Hebrew particle that denotes the accusative. Symmachus, however, avoided literalism and produced a much freer translation in good biblical Greek.

The Targumim

There are a variety of Jewish Aramaic translations of the component parts of the Hebrew bible (Pentateuch, Prophets, and Writings), all with differing styles. Targum Onkelos to the Pentateuch and Targum Jonathan to the Prophets, however, were the only two authorized Targumim within rabbinic Judaism, both of which originated in Palestine and were later adopted and revised in Babylonia (probably no later than the 3rd century A.D.). Both Onkelos and Jonathan are literal renditions of the Hebrew, yet both display influence from contemporary rabbinic thought. There are two other complete Targumim to the Pentateuch, Neofiti and Pseudo-Jonathan, both of which are Palestinian in origin and very expansive in style. Neofiti dates from the 2nd century A.D., but contains traditions of interpretations that are older, whereas Pseudo-Jonathan is written in a different style of Aramaic, probably dating from the ninth century A.D. There are also Targumim to all the books of the Writings except Ezra, Nehemiah, and Daniel. These Targumim vary in style and date, although the majority are late (7th century A.D. onward) and expansive in style. It should be noted that with all the Targumim dating is difficult, as they are all contain traditions that are quite often older than the Targum itself, and contain little internal evidence that permits an exact date of composition. Alongside all these there are collections of fragments of Targumim that emphasize the multiplicity of this genre of translation.

Debate continues however as to the original reason for translating the Bible into Aramaic. By far the majority opinion has been that the Jewish population in Palestine had forgotten Hebrew and thus needed an oral Aramaic translation for use in the synagogue alongside the public reading of the Hebrew Bible. Numerous rabbinic references surrounding the correct way to read the scriptures and then translate into Aramaic appears to support such a conclusion (e.g., Mishnah *Megillah* 4: 4). However, a greater understanding of the multilingual environment of Jewish Palestine has prompted a reassessment in some circles to question this as the initial reason for their inception, and an educational function, somewhat similar to the LXX, is being posited. The Targumim are seen as an element in the rabbinic curriculum (*Sifre Devarim* 161), linking the Written Torah (scriptures) to the Oral Torah (rabbinic literature/tradition), and are never spoken of independently of the Hebrew. In other words, they were designed to be read alongside the Hebrew and not to replace it. Such a conclusion is supported by the numerous manuscripts that preserve the Targumim alongside the Hebrew and not independently of it, as well as the fact that there are Targumim for parts of the Hebrew bible that had no liturgical function whatsoever (e.g., Job). Such a conclusion does not deny their liturgical function, but only questions that function as the reason for their inception.

The Peshitta

The Syriac version of the Hebrew bible is called the Peshitta ('simple version'), and is a collective work completed by the early 3rd century A.D., most probably in the region of Edessa. Its collective nature is clear from the comparison of different books that betray diversity in style. Such diversity, however, is best explained as originating among colleagues in a single school rather than from different communities with different agendas. The main question concerning the origin of the Peshitta is whether it is Jewish or Christian in origin. Numerous passages suggest a relationship to the New Testament and appear to preserve Christological interpretations, and some passages appear to be influenced by the LXX. Such findings have caused some to posit a Christian origin for the translation. On the other hand, there are

numerous passages that betray influence from Jewish exegesis of scripture, and there are a number of parallels with rabbinic sources. These facts, combined with the fact that the Hebrew text was clearly the basis for the translation, suggest a possible Jewish context for its origin. The debate remains open at present, although serious consideration must be given to the Jewish origin of at least the Pentateuch, if not for the whole book.

A brief mention should also be made of the Syro-Hexapla, which is a 7th-century translation, by Paul the bishop of Tella, of Origen's revision of the LXX text, but also taking the translations of Aquila, Theodotion and Symmachus into account.

The Vulgate

In the late 4th/early 5th century, in Bethlehem, Jerome undertook his new Latin translation, not from the LXX as with his previous translations of biblical books, but from Hebrew, described by Jerome as the *Hebraica Veritas*, the true Hebrew text. Jerome's was the first Christian translation of the Hebrew, and although of great importance was not initially accepted as authoritative, but simply added to the multiplicity of Latin translations current at that time, a multiplicity that Jerome was fighting. Surviving fragments as well as quotations from church fathers provide evidence for this multiplicity of Latin texts, although it is hard to tell if they all stem from an original or are independent of one another. They are grouped today under the rubric *Vetus Latina*.

The Vulgate, as we know it today, is essentially the stabilization of two traditions: Jerome's *Hebraica Veritas* and the Old Latin versions of the LXX, with the *Hebraica Veritas* taking precedence where the two are in conflict, and thus the original aim of Jerome of providing an authoritative Latin version was eventually realized.

Within Jerome's work there is clear evidence of the influence exerted by his Jewish teachers as well the probable influence of classical sources with which he was so familiar.

Ethiopic

The Ethiopic bible is a Christian translation of the Greek New Testament and the Hebrew Old Testament, with the gospels being translated by the early 5th century A.D., closely followed by the Psalms, Job, and Isaiah, with the whole project being completed by the 7th century. The commonly held view that the translation was completed by Syrian missionaries using the Peshitta text as their source text needs revising, as it is clear that the Hebrew was the source, with the Syriac exerting some influence.

Historical Context

The history of translating the Bible into English has as its wider communications context the world of western Christendom, dominated for about 1000 years by the Latin language and the text of Jerome's *Vulgata*. This 4th century C.E. translation quickly displaced earlier Old Latin versions and by the Carolingian era became the western Church's official text of the Bible. It was within the context of the lengthy Latin dominance in the British Isles that the initial efforts to 'English' the Bible began to emerge. These impulses were generally related to reforming movements in the Church, with their particular urgency that scripture in the vernacular would more readily communicate its meaning to the ordinary person than it could in Latin. Opponents of vernacular translation saw it as a threat to accuracy and doctrinal stability. But the precedent encouraging the reformers was that translations had been done already in ancient times for Jews and Christians who could not use the Bible's original languages. So, it would be by translation that English speakers would best be able to hear and read the Bible with understanding, and without need of interpretive 'gatekeepers.'

The Medieval Bible

This was the goal of the influential early translators, John Wyclif (ca. 1328–1384) and William Tyndale (ca. 1492–1536), and also of the translators of the Authorized Version (AV). But already in Anglo-Saxon times there had been 'Englishings' of parts of the Bible, based on the Latin Vulgate. Numerous translations of the Psalms appeared, such as those associated with Aldhelm (d. 709) and Alfred the Great (849–899). The *Lindisfarne Gospels* (ca. 700) feature the Latin text with an interlinear translation glossed in a literal Northumbrian English by Aldred (ca. 950). The *West Saxon Gospels* (ca. 1070) present a complete English text of the Gospels.

It was Wyclif and his Lollard confreres who prepared the first complete English Bible in the latter half of the 14th century, but they had to work from the Vulgate since they did not know Hebrew and Greek. The Wyclif Bible is extant in two main editions, one so literal in approach that it omitted phrases like 'to be' since Latin does not require them. The other edition is considered a later smoothing revision. The preface to the Wyclif Bible contains a sophisticated review of the kinds of problems translators must resolve when working from Latin, with its different verb system. Oddly, this translation had a somewhat antiquated style at its appearance, since Wyclif employed early Middle English at the very time late Middle English was blooming. Although suppressed by Church authorities, some of its phrasings made their mark on the common stock of English biblical language, e.g., "halewid be thi name" (Luke 11.2), and "I shal not dreden euelis, for thou art with me" (Ps. 23.4). Although many copies of this (pre-Gutenberg) Bible were burned, the survival of about 170 copies suggests that a considerable number had been made and that Wyclif's influence was substantial.

The Tudor Bible

By the time of Tyndale, only 150 years later, a virtual sea change had occurred. The Renaissance had spurred intense learning in the biblical languages and textual scholarship, and the technology of printing had been established. Unlike Wyclif, whose English was replete with Latinisms due to his dependence on the Latin text, Tyndale was advantaged by knowing both Greek and Hebrew. His work is thus the first English example of a primary translation, done directly from the Bible's original languages, and not a secondary one, a translation of a translation. His scholarship, and his brilliance with English phrasing, made Tyndale the most influential antecedent of the later AV. Tyndale's aim, as Wyclif's, was to make the Bible accessible to ordinary people. Thus he aimed for an English that was so direct and simple that it could be recited by a plowboy working in the field. Tyndale is widely acclaimed as the inventor of modern English prose, his skillful phrasings turning a somewhat unwieldy language into one of felicity and grace.

The *West Saxon Gospels* (ca. 1070) present a complete English text of the Gospels.

It was Wyclif and his Lollard confreres who prepared the first complete English Bible in the latter half of the 14th century, but they had to work from the Vulgate since they did not know Hebrew and Greek. The Wyclif Bible is extant in two main editions, one so literal in approach that it omitted phrases like 'to be' since Latin does not require them. The other edition is considered a later smoothing revision. The preface to the Wyclif Bible contains a sophisticated review of the kinds of problems translators must resolve when working from Latin, with its different verb system. Oddly, this translation had a somewhat antiquated style at its appearance, since Wyclif employed early Middle English at the very time late Middle English was blooming. Although suppressed by Church authorities, some of its phrasings made their mark on the common stock of English biblical language, e.g., "halewid be thi name" (Luke 11.2), and "I shal not dreden euelis, for thou art with me" (Ps. 23.4). Although many copies of this (pre-Gutenberg) Bible were burned, the survival of about 170 copies suggests that a considerable number had been made and that Wyclif's influence was substantial.

The Tudor Bible

By the time of Tyndale, only 150 years later, a virtual sea change had occurred. The Renaissance had spurred intense learning in the biblical languages and textual scholarship, and the technology of printing had been established. Unlike Wyclif, whose English was replete with Latinisms due to his dependence on the Latin text, Tyndale was advantaged by knowing both Greek and Hebrew. His work is thus the first English example of a primary translation, done directly from the Bible's original languages, and not a secondary one, a translation of a translation. His scholarship, and his brilliance with English phrasing, made Tyndale the most influential antecedent of the later AV. Tyndale's aim, as Wyclif's, was to make the Bible accessible to ordinary people. Thus he aimed for an English that was so direct and simple that it could be recited by a plowboy working in the field. Tyndale is widely acclaimed as the inventor of modern English prose, his skillful phrasings turning a somewhat unwieldy language into one of felicity and grace.

Tyndale's work in the Old Testament is particularly striking and has given many familiar forms and phrases to English prose that are the direct result of Hebrew style and structures. Examples include the parasyntactic style that links clauses by the simple conjunction 'and' (mirroring the Hebrew use of *waw*), the typical Hebrew construct formula 'x of x' ('holy of holies') for genitival and adjectival phrases, and, like the Hebrew language, a simple lexical stock. Tyndale's critics accused him of being overly influenced by Luther and the reformers, and claimed to have found several thousand translation errors. This perception of errors was due largely to the fact that Tyndale worked from the Greek, not Latin. In addition, he chose to render *ecclesia* ('church') as 'congregation,' *agape* ('charity') as 'love,' and *presbyter* ('priest') as 'elder' or 'senior,' to the consternation of traditionalists such as Thomas More. Estimates have been made that at least a third of the AV's wording comes directly from Tyndale, and the rest shows his influence in style, syntax, and word choices. He consistently avoided opaque Latinisms, as is exemplified in his choice of 'our daily bread' for the obscure Greek term *epiousion* in the Lord's Prayer (Matt. 6.11). In contrast, the later Reims-Douai translation merely transliterates the Vulgate text as 'our supersubstantial bread.' Here, no later translation has improved on Tyndale.

When the AV work was begun in 1604, there were as many as 10 earlier English Bibles extant. Several of these were significant. The Bible of Miles Coverdale (1535) appeared only 10 years after Tyndale's New Testament (1525) and five after his Pentateuch. Coverdale was also a major contributor to the Great Bible (1539). The Geneva Bible (1560) was translated by scholars in exile from the persecutions of Mary Tudor (1553–1558) who were sympathetic with the emerging Puritan movement. The Bishops' Bible (1568) was prepared in the first decade of Elizabeth I, to supply a church-approved alternative to the tendentious Geneva Bible with its anti-Catholic polemical notes. The Reims-Douai Bible (1609) was translated by Catholic exiles; it was a literal rendering of the Vulgate, yielding many Latinisms.

The Authorized Version

In the 1st year of his reign, James I (1603–1625) took action on the issue of how to arrive at an English Bible that would be a standard translation preferred by both Church authorities and the people. He appointed a committee of 54 learned divines, and called the Hampton Court Conference (1604), there giving the AV committee its mandate. They were to draw on the best features of all the recent English Bibles, consult the best Hebrew and Greek texts available, use the Bishops' Bible as a baseline text, and produce a translation that would stand above all others and thereby unite English speakers around a common Bible text.

This was less than a century after Tyndale, but by now the largely Cambridge and Oxford scholars assigned to the AV translation committee were very competent in the biblical languages and in biblical scholarship. They were exemplary scholars and their translation theoretics are brilliantly set forth in their preface to the AV, 'The Translators to the Reader.' Nevertheless, they were severely limited in regard to both the number and weightiness of the manuscript copies they then had to work from. For the New Testament, they had access only to late manuscript copies from the 13th to the 16th centuries. The oldest and most weighty of the NT majuscule manuscripts from the 4th and 5th centuries (Codices Vaticanus, Sinaiticus, and Alexandrinus, all late 19th century discoveries), along with even older papyri recently discovered, have subsequently revolutionized the study of the NT text. Revelation 1.5 illustrates this well: the Greek text used for the AV had *lousanti* 'washed,' but the ancient witnesses have *lusanti* 'freed.' The later manuscripts repeat a homophonic copyist's error, so modern translations follow the weightier texts, translating: "freed us from our sins by his blood" (NRSV) not "washed us from our sins in his own blood" (AV).

Because they used the Bishops' Bible as the base, the AV had an archaizing character from the outset. The works of the great poets and writers of the Elizabethan age were already having an impact on English, and the language was swiftly evolving. For example, in the last quarter of the 16th century, use of the possessive 'its' had become common, but 'its' is not in the AV. Curiously, the AV continued to use more awkward circumlocutions such as "toward the forepart of it, over against the other coupling thereof" (Exod. 39.20). The translators also created particular phrasings to translate grammatical distinctives in the biblical languages. The Hebrew infinitive absolute, for example, when coupled with the finite verb, adds intensity. They often covered this with 'surely,' but also resorted to Hebraic style, as in Gen. 22.17, "in blessing I will bless thee." Overall, their skilled use of vocabulary and syntax, their poetic sensitivity and cadenced prose, created what may well be the most influential literary text in English.

Bible Translation: Changing Theory and Practice

Until the mid-20th century, most Bible translation was done according to a methodology called literal or word for word substitution (more recently called formal equivalence or concordance). The AV is the best English exemplar of this approach, as it seeks largely to represent the style and structure of the original language texts as directly as possible in the receptor language. Advocates of this model claim that word for word equivalence yields precision and accuracy. Yet, more often than not, this model yields a translation in an unnatural (e.g., Hebraicized) English, which can actually obscure meaning for the reader/hearer.

Until recently, it was widely thought that all a Bible translator needed was knowledge of the Biblical languages. Through the efforts of linguist-translators such as Eugene A. Nida in the mid-20th century, practitioners in the field of Bible translation gradually became aware that more was needed. Nida stressed that it is as important for clear communication (if not more important) that Bible translators also understand such things as the dynamics of socio-semiotics, and the discourse structure and language patterns inherent to the receptor languages themselves. As the insights of linguistics and audience-oriented translation theoretics were brought to bear on Bible translation, one of the urgent questions was that of accuracy in relation to the sacred text. Jerome, already in the 4th century, was aware of this tension: "From my youth up I have always aimed at rendering sense not words ... A literal translation from one language to another obscures the sense" (Epistle 57.6). Luther also recognized this: "Whoever would speak German should not use Hebrew style ... Once he has the German words that serve the purpose, let him .. express the meaning freely in the best German he knows" (*Weimar Ausgabe, Tischreden* 2.648–649). The reality is that almost all Bible translation now being done operates on the same spectrum between the poles of literal and free and incorporates both. The guiding maxim of the NRSV Bible (1989) was "as literal as possible, as free as necessary" (*see* **Translational Equivalence**).

Modern English Translations of the Bible

The history of the English Bible from the early 1600s to the mid-20th century has largely been that of the AV, with numerous updates of its orthography and wordings over the centuries, seeking to assure continuing meaning for readers increasingly distant from the archaisms of Elizabethan English. The period from 1611 to 1881, despite the AV's dominance, saw the preparation of about 70 English translations. By the late 1800s a major revision of the AV was needed to bring it up to date with the startling new manuscript discoveries and new learnings. The result was the English Revised Version (RV, 1885) in Great Britain and the American Revised Version (ASV, 1901) in the United States. These were very concordant revisions, prized in some churches for their literalness, but for readability and natural English style they represent a step backward. Some scholars have said that Tyndale's phrasings in many cases have a more modern ring. The 20th century, especially its latter half, witnessed a proliferation of new Bible translations in English. And in the 1980s and 1990s most major English translations were revised substantively to bring their English better into line with the shifts in common usage then occurring in the language for handling gender inclusiveness. Curiously, the AV translators had already addressed this issue, in microcosm, when they chose consistently to translate Hebrew *bene Yisra'el* 'sons of Israel' as 'children of Israel,' since Hebrew used it inclusively for 'the people.'

Among the most significant of the modern English Bibles are the following. The Revised Standard Version (1946–1952, further revised in 1989 as the New Revised Standard Version) may be the most influential English version of the 20th century. The Jerusalem Bible (1966, revised 1985), first translated into French in 1961, was brought into English by a team of Catholic scholars, largely British, aiming at the natural English style of educated speakers of British English. The New English Bible (1970, revised 1989) was translated by a British interconfessional team. The translational approach is functional equivalence at a high literary level. The churches were generally critical of this Bible, finding the language too different from the familiar AV. TANAKH (1985) is a high-level, nonconcordant English version of the Hebrew Bible, translated in the United States under the aegis of the Jewish Publication Society.

Bickerton, Derek (b. 1926)

H Kishimoto, Kobe University, Kobe, Japan

© 2006 Elsevier Ltd. All rights reserved.

Derek Bickerton was born in Cheshire, England. His initial training was in English literature, and he got his B.A. in 1949 and M.A. in 1967 in this field from the University of Cambridge. Before starting his career as a linguist in the 1970s, he wrote fiction, including poetry, short stories, play scripts, and novels, while living in Madrid, the Mediterranean islands of Ibiza and Mallorca, and Barbados. He first developed his interest in linguistics in Barbados. Bickerton initially supported himself by teaching English as a second language, but in 1964 he was employed as a lecturer in modern English at the University College of Cape Coast in Ghana. In 1967, he was appointed as a senior lecturer in the English language and linguistics at the University of Guyana. In Guyana, his major research interest in Creole languages sprouted from an exposure to the local Creole language (Guyanese Creole [Guyanese Creole English]). The result of the research he conducted on Guyanese Creole was published as *Dynamics of a creole system* (1975), shortly after he moved to the University of Hawaii. He has accepted many visiting positions at various institutions such as the University of Michigan, State University of New York at Stony Brook, Universidade de Campinas (Brasil), Unversidade Católica in São Paulo, Universidate Federale (Rio de Janeiro), University of Texas at Austin, Universiteit van Amsterdam, and Université de Province.

In Hawaii, Bickerton started to study Hawaiian Creole (Hawaiian Creole English) and found many features shared with other creole languages including Guyanese Creole. The research in Hawaii eventually developed into his best-known theory, 'Language Bioprogramming Hypothesis,' according to which language emerges through an evolutionary neurobiological process, forming an integral part of the human brain. The claim is about the nature of universal grammar (UG), but differs from Chomsky's in that Bickerton sees that genetically inherited bioprogramming, which is responsible for language acquisition, unfolds gradually, while Chomsky insists on instantaneous acquisition of language. Creolization is regarded as the outcome of the learning of a pidgin language by children. Notably, pidgin languages differ diversely, but creole languages do not. Furthermore, grammatical features shared by creole languages are often not found in pidgin languages, although the latter precede the former. Since creolization, but not pidginization, involves the acquisition of language, which is prone to bioprograming, the recurrence of certain features is expected in creole languages, but not in pidgin languages.

Bickerton's idea has attracted the attention of a large audience through the most widely cited and reviewed creole work, *Roots of language* (1981), in which the evolution of creole languages from pidgin languages was delineated within the framework of the Language Bioprogramming Hypothesis. *Language and species* (1990), the book following *Roots of language*, focused more on the explanation of a more general evolutionary biological process leading to the emergence of human language, which radically differs from animal communication systems.

Bikol

J W Lobel, University of Hawai'i, Mnoa. HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Bikol refers to a group of three related Austronesian languages spoken in the Bikol Region of the southern Luzon peninsula of the Philippines, one of the central Philippines' most dialectally diverse areas. As a branch of the Central Philippine subgroup, Bikol is coordinate with the Tagalog and Bisayan branches. The Bikol branch contains 2 of the 12 major Philippine languages (i.e., those having more than 1 million speakers), with Northern Bikol (Central Bicolano) (including the standard Bikol of the cities of Naga and Legaspi) having 2.5 million speakers, and Southern Bikol (Bicolano, Albay), with about 1 million speakers. A third language, Northern Catanduanes Bikol (Bicolano, Northern Catanduanes), has a population of approximately 100 000. Most speakers of a Bikol language simply refer to their language as 'Bikol' without any further distinction of the specific language or dialect they speak. Furthermore, the name Bikol is also used by native speakers to refer to two dialects in central and southern Sorsogon province, even though these dialects are generally classified as Central Bisayan dialects with heavy lexical borrowing from Bikol.

All of the Bikol languages are spoken natively solely within the Bikol Region, a political unit that includes the six provinces of Camarines Norte, Camarines Sur, Albay, Sorsogon, Catanduanes, and Masbate. The Northern Bikol language consists mainly of dialects spoken in and around the major centers of Naga, Legaspi, Daet, and Virac, along with the entire northern coast of the Bikol peninsula from Vinzons in Camarines Norte to Prieto Diaz in Sorsogon, as well as in the town of San Pascual in Masbate Province, and Magallanes in central Sorsogon. The Southern Bikol language consists of the Rinconada and Buhi-non dialects of southeastern Camarines Sur, the Miraya dialects in southwestern Albay and Donsol town in northwestern Sorsogon province, and the dialect of Libon, Albay. The Northern Catanduanes language is spoken in the northern half of the island of Catanduanes.

The standard dialect of the Bikol Region is the dialect of the cities of Naga and Legaspi, referred to as 'Bikol Naga' in the towns closer to Naga and as 'Bikol Legaspi' in the towns closer to Legaspi. The origin of this dialect's status can be traced to the end of the 16th century when Naga (formerly Nueva Caceres) was one of only three officially designated *ciudades* and the seat of one of only three bishops outside of Manila. (Doeppers, 1972) This dialect is still used by the church throughout the Bikol Region to the exclusion of all other varieties of Bikol. With the exception of Bikol Naga, most of the speech varieties of the Bikol Region are underdocumented. The only works that have been published on other dialects are a short description (Yamada, 1972) and textbook (Portugal, 2000) for Buhi-non, and a phrasebook (Lobel and Bucad, 2001b) for Rinconada.

The Bikol language (Naga dialect) was first documented by Marcos de Lisboa (d. 1622), whose *Vocabulario de la lengua Bicol* was published posthumously in 1754 and republished in 1865. Lisboa's work was preceded in print by Andres de San Agustin's (d. 1649) *Arte de la lengua Bicol*, first published in 1647, and republished in 1739, 1795, and 1879. Together, these two works represent the basis of nearly everything written about the Bikol language prior to the 20th century.

The major modern works on Bikol include a textbook (Mintz, 1971a), a grammar description (Mintz, 1971b, 1973), a dictionary (Mintz and del Rosario Britanico, 1985), and two descriptions of dialectology (McFarland, 1974 and Lobel and Tria, 2000). With the exception of the dialectology studies, all of these works concentrate exclusively on the standard Bikol of Naga or Legaspi.

During the first part of the 20th century, the Bikol Region was home to a relatively bustling literary scene, but today there are only scattered efforts at reviving a written tradition, and very little can be found in print in the Bikol language other than the Bible and other religion-related materials. In the past decade, there have been efforts to introduce Bikol language subjects in the schools, and several universities have offered electives in Bikol Language and Literature in recent years. In general, the local variety of Bikol is still the language of most daily transactions, with Tagalog and English being confined to educational institutions, most forms of media, and higher-level business and government transactions.

Bikol has the basic Central Philippine-type phonology with 16 consonants / p b m w t d n s l r y k g ng ʔ h /, three vowels / a i u /, contrastive stress, and contrastive length. Some dialects of Southern Bikol have preserved a fourth vowel as a reflex of PAn *e, usually realized as a high, central tense vowel /ɨ/ but also realized as /o/ in Libon. Two dialects have an extra consonant phoneme: Southern Catanduanes, which has an interdental lateral, and Buhi-non, which has

a voiced velar fricative. The Bikol orthography is largely phonemic except that it does not represent stress, length, or the glottal stop.

Bikol is agglutinative, with a complex system of verbal morphology expressing a wide variety of semantic and syntactic contrasts. Although sometimes analyzed as ergative, these languages are probably of a separate type called Symmetrical Voice Languages in which multiple voice distinctions exist, yet none can be considered more basic than the other (Himmelmann, to appear). Like most other Philippine languages, there are four main verbal voices or 'focuses' (Actor, Object, Location, and Beneficiary) and three case distinctions (Nominative, Genitive, and Oblique) marked on Noun Phrases, name phrases, and pronouns by an introductory morpheme. Nouns, adjectives, and verbs distinguish between singular, plural, and in some cases, dual, and verbs may also be marked for reciprocal action. A number of other meanings can be marked by verbal affixes, including accidental, abilitative, distributive, repetitive, causative, social, diminutive, and infrequentive. Tense-aspect-mood distinctions include infinitive, past/perfective, present/progressive, future, imperative, negative, and negative imperative. Both reduplication and repetition are productive mechanisms that can denote diminutive, repetitive, and intensive meanings, among others. Refer to the following tables for more information about: pronouns, case markers, demonstratives, and focus-mood-aspect morphology.

The Bikol languages have much the same grammatical structure as Tagalog, except for (a) a preference for inflecting verbs for plural actors (with the infix *-Vr-*), (b) the existence of distinct imperative forms, (c) the indication of repetitive action by a verbal affix (*-para-*), and (d) a more elaborate system of case markers that distinguish between referential and nonreferential, and in some dialects, past vs. nonpast.

A noteworthy feature of the Bikol languages is the presence of a speech register reserved for use in anger (Mintz, 1991, Lobel to appear). The lexicon of this angry register is usually either loosely derived or totally unrelated to their normal, nonangry equivalents. As such, an utterance by an angry speaker may hardly resemble an utterance with the same meaning spoken by a nonangry speaker.

Bilingual Education

C Baker, University of Wales, Bangor, North Wales, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The term bilingual education has multiple meanings, with varying positive and negative associations, and a varied history. Take three cases. First, bilingual education is loosely used to refer to schools attended by bilingual children (e.g., Latinos and Latvians in U.S. schools, Greek and Gujarati children in U.K. schools). However, bilingualism is not fostered in such schools. Rather, the aim is to shift the child rapidly from the home, minority language to the dominant, majority language. Second, the term refers to children who are allowed to use their home language in the classroom for only a short period (e.g., one or two years) until they switch to the majority language (called transitional bilingual education). Third, bilingual education appears a more appropriate label for schools in which students learn through two languages in the classroom. For example, there are dual language schools in the United States that teach students through Spanish for one day and the next day through English. In Europe, there are elite bilingual programs (e.g., Luxembourg, Switzerland) in which children both learn, and learn through two or more prestigious languages (e.g., German, French, English).

Types of Bilingual Education

Given that bilingual education has multiple meanings, some clarity is possible by defining different types of bilingual education. Although Baker (2001) and Garcia (1997), respectively, define 10 and 14 different types of bilingual education, a threefold categorization is helpful.

1. 'Null' forms of bilingual education bring together bilingual children but with the aim of monolingualism in the majority language. Submersion education is the term used in academic writing for such education, but not by school systems that tend to use the term mainstreaming. Submersion education implies that the child (on immediate entry to school) only experiences the majority language. The child is thrown into a language at the deep end and are expected to sink or swim in the majority language from the first day.
2. 'Weak' forms of bilingual education allow children to use their home language for a temporary period until they can switch totally to the majority language (Carrasquillo and Rodriguez, 2002). Weak forms of bilingual education include structured immersion, withdrawal classes, various forms of sheltered English, transitional bilingual education, and mainstreaming with foreign language teaching. Second language and foreign language teaching in schools occasionally produces competent bilinguals. Generally, such teaching does not result in age-appropriate proficiency in the second or foreign language, nor reaches a level of language that enables learning of curriculum content to occur via that language. Sometimes, a subset of language abilities is developed for instrumental or practical reasons (e.g., travel, trade, cultural awareness).
3. 'Strong' forms of bilingual education aim for each child, irrespective of ability, to achieve

Introduction

The term bilingual education has multiple meanings, with varying positive and negative associations, and a varied history. Take three cases. First, bilingual education is loosely used to refer to schools attended by bilingual children (e.g., Latinos and Latvians in U.S. schools, Greek and Gujarati children in U.K. schools). However, bilingualism is not fostered in such schools. Rather, the aim is to shift the child rapidly from the home, minority language to the dominant, majority language. Second, the term refers to children who are allowed to use their home language in the classroom for only a short period (e.g., one or two years) until they switch to the majority language (called transitional bilingual education). Third, bilingual education appears a more appropriate label for schools in which students learn through two languages in the classroom. For example, there are dual language schools in the United States that teach students through Spanish for one day and the next day through English. In Europe, there are elite bilingual programs (e.g., Luxembourg, Switzerland) in which children both learn, and learn through two or more prestigious languages (e.g., German, French, English).

Types of Bilingual Education

Given that bilingual education has multiple meanings, some clarity is possible by defining different types of bilingual education. Although Baker (2001) and Garcia (1997), respectively, define 10 and 14 different types of bilingual education, a threefold categorization is helpful.

1. 'Null' forms of bilingual education bring together bilingual children but with the aim of monolingualism in the majority language. Submersion education is the term used in academic writing for such education, but not by school systems that tend to use the term mainstreaming. Submersion education implies that the child (on immediate entry to school) only experiences the majority language. The child is thrown into a language at the deep end and are expected to sink or swim in the majority language from the first day.
2. 'Weak' forms of bilingual education allow children to use their home language for a temporary period until they can switch totally to the majority language (Carrasquillo and Rodriguez, 2002). Weak forms of bilingual education include structured immersion, withdrawal classes, various forms of sheltered English, transitional bilingual education, and mainstreaming with foreign language teaching. Second language and foreign language teaching in schools occasionally produces competent bilinguals. Generally, such teaching does not result in age-appropriate proficiency in the second or foreign language, nor reaches a level of language that enables learning of curriculum content to occur via that language. Sometimes, a subset of language abilities is developed for instrumental or practical reasons (e.g., travel, trade, cultural awareness).
3. 'Strong' forms of bilingual education aim for each child, irrespective of ability, to achieve

bilingualism, biliteracy, and cultural pluralism. Such outcomes are gained mainly through students learning content (e.g., mathematics, social studies) through both languages. Strong forms of bilingual education include U.S. dual language schools, Heritage Language programs, Canadian Immersion, and the European Schools movement. Three of these strong forms of bilingual education will be discussed here, so as to define education that has bilingualism as an educational outcome rather than bilingual children as an input.

Immersion Bilingual Education

Immersion education typically has students from majority language backgrounds (e.g., English homes in Canada; Swedish homes in Finland) and teaches them through another majority or a minority language (e.g., French in Canada). However, there are many variations: first, the age at which a child commences the experience. This may be at the kindergarten or infant stage (early immersion), at 9 to 10 years old (delayed or middle immersion), or at secondary level (late or late-start immersion). Second, the amount of time spent in immersion. Total immersion usually commences with 100% immersion in the second language, reducing after 2 or 3 years to 80% per week for the next 3 or 4 years, finishing junior schooling with approximately 50% immersion in the second language per week. Partial immersion provides close to 50% immersion in the second language throughout infant and junior schooling.

Children in early immersion are usually allowed to use their home language for a year or more for classroom communication. There is no compulsion to speak the second (school) language in the playground or when eating lunch. The child's home language is valued and not disparaged. Such children also start immersion education with relatively homogeneous language skills. This not only simplifies the teacher's task, it also means that students' self-esteem and classroom motivation are not threatened because of some students being linguistically more advanced.

Heritage Language Bilingual Education

Heritage language bilingual education occurs when language minority children use their native, ethnic, home, or heritage language in the school as a medium of instruction and the goal is competence in two languages. Examples include education through, or more often partly through, the medium of Navajo or Spanish in the United States (Francis and Reyhner, 2002), or Basque in Spain (Gardner, 2000), or aboriginal languages in Australia (Caldwell and Berthold, 1995). In China, since 1979 minority language education has been provided for over 20 minority groups, partly as a way of improving ethnic minority relationships with central government (Blachford, 1997). In the Canadian provinces of Manitoba, British Columbia, Saskatchewan, and Alberta, there are heritage language bilingual education programs. The heritage language is the medium of instruction for about 50% of the day (e.g., Ukrainian, Italian, German, Hebrew, Yiddish, Mandarin Chinese, Arabic, and Polish). Heritage language programs in the United States (see Krashen *et al.*, 1998) and elsewhere vary in structure and content and overlap with the 90:10 model of dual language education (see later). Some of the likely features are described here.

Most of the children come from language minority homes but may be joined by a small number of majority language children whose parents desire bilingualism in their children. Such parents will often have the choice of sending their children to mainstream schools or to heritage language programs. In most cases, the majority language will also be used in the curriculum, ranging from second language lessons to a varying proportion (e.g., 10% to 50%) of the curriculum being taught in the majority language. There is a tendency to teach mathematical, technological, and scientific studies through the majority language, and to use the majority language progressively more across the grades.

Where a minority language is used for a majority of classroom time (e.g., 80% to almost 100%), the justification is that children easily transfer ideas, concepts, skills and knowledge into the majority language. Having taught a child multiplication in Mohawkian, this mathematical concept does not have to be retaught in English. The **justification** given for such programs is also that a minority language is easily lost, a majority language is easily gained. Children tend to be surrounded by the majority language, especially in the teenage years. Thus, bilingualism is achieved by an initial concentration on the minority language at school.

Dual Language Bilingual Education

U.S. dual language (or two-way) bilingual education typically occurs when there is an approximate balance in numbers between language minority and language majority students in the same classroom. Whereas a 50:50 **language balance** often was advised, the majority language can become dominant (e.g., because of its higher prestige value), putting the aim of bilingualism and biliteracy at risk.

Both languages are used for instruction and learning, revealing that the aim is to produce students

who are bilingual, biliterate, and bicultural or multicultural (Lindholm-Leary, 2001). Dual language schools use a non-English language for at least 50% of curriculum time for up to six grades. In each period of instruction, only one language is used, such that students learn a new language mostly via content. Genesee and Gándara (1999) suggest that such schools enhance intergroup communication and cultural awareness. They produce children who, in terms of intergroup relations, are likely to be more tolerant and sensitive. "Contact between members of different groups leads to increased liking and respect for members of the outgroup, including presumably reductions in stereotyping, prejudice, and discrimination" (Genesee and Gándara, 1999: 667).

Some teachers use both languages on different occasions with their students; others just use one language and may be paired and work together closely as a team. The school ethos also will be bilingual by classroom and corridor displays, curriculum resources, announcements, and extracurricular activity using both languages if possible.

A central idea in dual language bilingual schools is language separation and language boundaries. Language boundaries are established in terms of time, curriculum content and teaching. One frequent preference is for each language to be used on alternate days. Alternately, different lessons may use different languages with a regular change over to ensure both languages are used in all curricula areas. The division of time may be in half days, whole days, or alternate weeks. The essential element is the distribution of time to achieve bilingual and biliterate students. Often, a 50:50 balance in use of languages is attempted in early grades, although in some schools, the minority language is given more time (60% to 90% of the available time). In the later years of schooling, there is sometimes a preference for more emphasis on the majority language.

Bilingual Education and Politics

There is no deep understanding of bilingual education except through understanding the politics behind such education. There are varying philosophical and political origins to bilingual education that underpin different models of bilingual education. For example, bilingual education is best understood by reference to national variations (Cummins and Corson, 1998). The contrasting politics of Canada's two language solitudes and South Africa's management of social integration when retaining multilingualism, the ardor of language activists in the Basque Country and the more gentle revolution in Wales, the suppression of Breton in France, and the historical repression of Native American Indian languages in the United States illustrate that the history and politics of a nation shapes its approach to languages and bilingual education.

The contemporary politics of bilingual education relates to the education of immigrants (e.g., in the United States, the United Kingdom), the preservation of nationalism (e.g., the fate of Breton in France), the devolution of power to regions (e.g., Wales, Catalonia), language revitalization (e.g., Native American Indians, the Maori in New Zealand), internationalism (e.g., the European Schools Movement, bilingual education in Japan), and the emancipatory education of deaf people (e.g., through bilingual education in a sign language and a majority language – see Baker and Jones, 1998). The varying politics of immigrant assimilation and political integration, economic protectionism and global trade, institutionalized racism and equality of opportunity, and recent debates about peace and terrorism can make bilingual education as much about politics as about education. Bilingual education also has become associated with political debates about dominance and control by elites, questions about social order, and the perceived potential subversiveness of language minorities (Garcia, 2002; Tollefson, 2002).

In Macedonia (Tankersley, 2001), China (Zhou, 2001), the United States (Wiese and Garcia, 2001), and the South Pacific (Lotherington, 1998), bilingual education also can be positively located within attempts to effect social, cultural, economic, or political change, particularly in strengthening the weak, empowering the powerless, and invigorating those most susceptible. This is illustrated by Tankersley (2001). Contextualized within the recent ethnic conflict in the Balkans, she examines a Macedonian/Albanian dual language program. The program demonstrated success in aiding community rebuilding after the war and the growth of cross-ethnic friendships. The research shows the potential for bilingual education program to develop students' respect for different languages and cultures, and help to resolve ethnic conflict. However, because the Macedonian language was connected with greater power and prestige, obtaining an equal balance of languages in the classroom was complex.

The importance of a historical perspective on bilingual education as politics is provided by Wiese and Garcia (2001) through an analysis of the U.S. Bilingual Education Act from 1968 to the present. The changing U.S. ideologies in minority language civil liberties, equality of educational opportunity, assimilation, and multiculturalism become translated into legislation and tested in litigation. Most recently, the No Child Left Behind Act of 2001 placed an

emphasis on accountability and testing. Whereas Title V authorizes programs for Native Indian, Native Hawaiian and Alaskan Native Education, Title III requires testing in English for most language minority students. All states are required to monitor the progress of some 3.68 million U.S. language minority students in meeting their English proficiency and academic objectives. The paradox is that the No Child Left Behind Act of 2001 followed the September 11 terrorist attacks. In the aftermath of the attacks, politicians, the press, and the public lamented the lack of language and cultural skills in U.S. intelligence and defense. It also seems possible that peace and harmony between religions and regions would be aided by producing bilinguals who appreciate the diversity that is possibly intrinsic in bilingualism and biculturalism.

Research and analysis of Proposition 227 in California has led to it being one of the most profiled examples of power and politics governing bilingual education (Stritikus, 2001; Crawford, 2004). In effect, Proposition 227 aimed at outlawing bilingual education in California. Proposition 227 was passed in a public ballot by a margin of 61% to 39%. Analysis of the voting and subsequent surveys found that Latinos were clearly against the proposition but, nevertheless, bilingual education became virtually illegal.

The importance of bilingual education for minority language literacy development and biliteracy has become a major recent theme (e.g., Martin-Jones and Jones, 2000; Hornberger, 2003). Using contexts of classroom, home, and community, such literacy research tends to be less concerned with teaching and learning methodology and more focused on, for example, the relationship between asymmetrical power relations and literacy practices that reproduce social inequalities and competing discourses about what counts as literacy. Current biliteracy research suggests that language policies and practices in education are struggles over power and authority, equity and marginalization, legitimacy and social order, symbolic domination and identities, social categorization, and social hierarchicization. Any consideration about who should speak what language, how, when, and where is essentially about what counts as legitimate language and who has dominance and control. Hence, those in power who legitimate the current social order regulate access to linguistic norms and linguistic resources to preserve their power and position.

However cogent and coherent are the philosophical and pedagogic and foundations for bilingualism, biliteracy, and biculturalism, however strong are the educational arguments for bilingual education, and however strong are the arguments for the preservation of vanishing languages in the world, it is the politics of power, status, assimilation, and social order that can refute bilingual education so swiftly. However, bilingual education is typically a necessary, and sometimes an essential condition for the preservation of language species in the world. Where there is a shortfall in minority language reproduction in the family, then language production at school is essential in education to retain or increase the number and density of minority language speakers. From preschool bilingual education to adult language learning (e.g., in Ulpanim), bilingual education has a possible contemporary function not only to educate but also for minority language transmission.

Language Revitalization through Bilingual Education

Bilingual education is sometimes a component of national or regional language planning that varyingly attempts to assimilate indigenous and immigrant minorities, or integrate newcomers or minority groups (e.g., U.S., U.K.). On other occasions, bilingual education is a major plank in language revitalization and language reversal (e.g., among Native American Indians, the Sámi in Scandinavia, and the Maori in New Zealand).

The growing interest in endangered and dying languages has recently provided a further raison d'être to bilingual education. The predicted demise of many or most of the world's languages has created a momentum for language planning (Littlebear, 1999; Nettle and Romaine, 2000; Skutnabb-Kangas, 2000; Spolsky, 2004). For a minority language to survive, it has to produce new speakers, mostly via family language transmission and the education system (including adult language learning). Language planners tend to believe that bilingual education is an important means of language maintenance, language revitalization and reversing language shift, for example, among Native American Indians (Bia and McCarty, 2002; Francis and Reyhner, 2002; House, 2002), Ecuadorians (King, 2001), and the Basques (Gardner, 2000). Language acquisition planning via bilingual education becomes essential for language revival but insufficient by itself.

Nevertheless, bilingual education cannot gain its rational solely from language restoration or maintenance. It requires research to demonstrate underlying educational advantages (e.g., raising student achievement, increasing employment opportunities). There is sometimes over-optimism among language planners about what can be expected from and delivered by bilingual education in revitalizing a language.

Although bilingual education has an important role in language reproduction, and without bilingual education a minority language may not be able to survive except through intense religious usage, bilingual education cannot deliver language maintenance by itself.

The Advantages of 'Strong' Forms of Bilingual Education

Support for bilingual education tends to circle around eight interacting advantages of bilingual education that are claimed for students. There also are societal benefits that already have been alluded to in the above discussion of politics and bilingual education and will be briefly mentioned later. This section concentrates on the individual advantages.

First, bilingual education typically enables both languages to reach higher levels of competency. This potentially enables children to engage in wider communication across generations, regions, and cultural groups (Cummins, 2000). Second, bilingual education ideally develops a broader enculturation, a more sensitive view of different creeds and cultures. Bilingual education will usually deepen an engagement with the cultures associated with the languages, fostering a sympathetic understanding of differences, and, at its best, avoids the tight compartmentalization of racism and stereotyping. Third, strong forms of bilingual education frequently leads to biliteracy (see Hornberger, 2003). Accessing literacy practices in two or more languages adds more functions to a language (e.g., using in employment), widening the choice of literature for enjoyment, giving more opportunities for understanding different perspectives and viewpoints, and leading to a deeper understanding of history and heritage, of traditions and territory (Tse, 2001).

Fourth, research on dual language schools, Canadian immersion education, and heritage language education suggest that curriculum achievement is increased through content learning occurring via dual language curriculum strategies (Cummins, 2000; Tse, 2001). This is returned to later in this article. Fifth, plentiful research suggests that children with two well-developed languages share cognitive benefits (Bialystok, 2001). Such thinking advantages include being more creative because of their dual language systems (Baker, 2001), being more sensitive in communication as they may be interpersonally aware, for example, when needing to codeswitch, and tend to be more introspective of their languages (metalinguistic advantages – see Bialystok, 2001). Sixth, children's self-esteem may be raised in bilingual education for minority language students (Cummins, 2000). The opposite is when a child's home language is replaced by the majority language. Then, the child itself, the parents and relatives, and not least the child's community may appear as inadequate and disparaged by the school system. When the home language is used in school, then children may feel themselves, their home, family, and community to be accepted, thus maintaining or raising their self-esteem.

Seventh, bilingual education may aid the establishment of a more secure identity at a local, regional, and national level. Sharing Welsh, Maori, or Native American Indian identity may be enhanced by the heritage language and culture being celebrated and honored in the classroom. Developing a Korean-American, Bengali-British, or Greek-Australian identity can be much aided by strong forms of bilingual education, and challenged or even negated by weak forms. Eighth, in some regions (e.g., Catalonia, Scandinavia) there are economic advantages for having experienced bilingual (or trilingual) education. Being bilingual can be important to secure employment in many public services and particularly when there is a customer interface requiring switching effortlessly between two or more languages. To secure a job as a teacher, to work in the mass media, to work in local government and increasingly in the civil service in countries such as Canada, Wales, and the Basque Country, bilingualism has become important. Thus, bilingual education is increasingly seen as delivering relatively more marketable employees than monolingual education (Dutcher, 1995; Tse, 2001).

To this list may be added the potential societal, ethnic group, or community benefits of bilingual education (May, 2001; Peyton *et al.*, 2001; Stroud, 2001; Tse, 2001) such as continuity of heritage, cultural vitality, empowered and informed citizenship, raising school and state achievement standards, social and economic inclusion, social relationships and networking, ethnic group self-determination, and distinctiveness. This is well illustrated by Feuerverger (2001) in an ethnography of a village (Neve Shalom/Wahat Al-Salam) in Israel, where Jews and Palestinians attempt to live together harmoniously and cooperatively, maintaining respect for the culture, identity, and languages of each group. This is partly attempted by two schools, an elementary school and the 'School for Peace,' which create bilingual Hebrew-Arabic bilinguals.

The Effectiveness of Bilingual Education

Research support for bilingual education is relatively robust (Baker, 2001) although there has been

much political challenge to this in the United States (Crawford, 2004). Perhaps the strongest research support for bilingual education derives from evaluations of immersion education, particularly from Canada since the 1960s (Johnstone, 2002). There is plentiful research from the United States since the 1960s (see Baker, 2001, for a review).

Evaluations of the effectiveness of dual language schools indicate relative success. One of the most wide-ranging evaluations of dual language schools is by Lindholm-Leary (2001). She analyzed teacher attributes, teacher talk, parental involvement and satisfaction, as well as student outcomes (using 4854 students) in different program types. These programs included Transitional Bilingual Education, English-Only, the 90:10 Dual Language Model, and the 50:50 Dual Language Model. The measured outcomes included Spanish and English language proficiency, academic achievement and attitudes of the students. Socioeconomic background and other student characteristics were taken into account in reporting results. Among a wealth of findings, Lindholm-Leary (2001) found that

- students who had 10% or 20% of their instruction in English scored as well on English proficiency as those in English-only programs and as well as those in 50:50 dual language (DL) programs;
- Spanish proficiency was higher in 90:10 than 50:50 (DL) programs. Students tended to develop higher levels of bilingual proficiency in the 90:10 than the 50:50 DL program;
- for Spanish-speaking students, no difference in English language proficiency was found between the 90:10 and 50:50 DL programs. However, DL students outperformed transitional bilingual education (TBE) students in English by the Grade 6;
- students in both the 90:10 and 50:50 DL programs were performing about 10 points higher in reading achievement than the Californian state average for English-speaking students educated in English-only programs;
- higher levels of bilingual proficiency were associated with higher levels of reading achievement;
- on Mathematics tests, DL students performed on average 10 points higher on Californian norms for English-speaking students educated only in English. There was a lack of difference in the scores of 90:10 and 50:50 DL students;
- DL students tended to reveal very positive attitudes toward their DL programs, teachers, classroom environment and the learning process.

Thomas and Collier's (2002) Final Report on their 1985 to 2001 database of 210,054 minority language students' academic achievement in eight different models of education indicates that: schooling in the home language has a much greater effect on achievement than socioeconomic status; late immigrants whose early education was in their home language outperformed early immigrants schooled in English only; enrichment (heritage language) 90:10 programs and dual language programs (50:50) were the most academically successful for English L2 students and had the lowest dropout rates; the strongest predictor of L2 student achievement is the amount of formal L1 schooling with the more L1 schooling, the higher the L2 achievement; the highest quality ESL content programs reduce about half of the total achievement gap between those in enrichment or dual language programs and those without any bilingual support.

However, the reasons why research finds bilingual education linked with higher achievement are neither simple nor straightforward (August and Hakuta, 1997). There is likely to be a complex equation between such academic success and factors such as the support of the home (e.g., in encouraging literacy development), the devotion and dedication of teachers in school, children feeling their minority language is accepted and their self-esteem thus supported, and the positive relationship between bilingual education and cognitive development. Laosa (2000) reveals that school characteristics such as the quality and ratio of teachers per student, the teacher's credentials, and fragmentation of instruction are potentially influential in student achievement. That is, particular models of bilingual education interact with a host of student, teacher, curriculum, and environmental variables in complex ways to influence student outcomes. It cannot be assumed that bilingual education, *per se*, results in higher attainment across the curriculum. There are many interacting variables that will underlie such success with no simple recipes for guaranteed success.

The English Language and Bilingual Education

The paradox of English in bilingual education is illustrated by the research of Valdés (2001). English language learning policies enacted in schools can deny access to the language and knowledge that would empower U.S. immigrant children. Valdés (2001) shows that, separately and cumulatively, there are complex interacting classroom factors that frequently work against a student's second language development, achievement, employment, citizen rights and opportunities, and self-esteem. Such factors include a lack of regular, purposeful, and developing interactions with native speakers, impoverished second lan-

guage interactions with teachers on a staff-student ratio of over 1:30, passive learning and 'tight discipline' strategies, mixed language competence classes working to a low common denominator, subject matter kept simplistic as the second language is insufficiently developed, and teachers' concerns with 'flawed language' forms rather than communication: "Placing blame is not simple. Structures of dominance in society interact with educational structures and educational ideologies as well as with teachers' expectations and with students' perspectives about options and opportunities" (Valdés, 2001: 4).

The 'English language dominance' dangers for bilingual education also are found in access to Information Communications Technology (ICT) for language minority students. ICT is often dominated by the English language. This relates to current debates about the place of the English language in bilingual education in the context of the internationalization of English and its growing worldwide prominence as a second language rather than a mother tongue (Graddol and Meinhof, 1999). In contrast, there are potential opportunities to support the future of minority languages in education through ICT such as e-books, machine translation, voice recognition, WebTV, international e-mailing, and text messaging (Skourtou, 2002).

The Limitations of Bilingual Education

Although bilingual education has an increasing number of international supporters, it is not without some political critics, especially in the United States – see Cummins (2000) for a review. This has been considered earlier. There also are limitations to the pedagogical view of bilingual education. Bilingual education is no absolute guarantee of effective schooling. It is ingenuous to imagine that employing two or more languages in the school curriculum automatically leads to a raising of achievement, more effective schooling, or a more child-centered education. In reality, the languages of the school are but part of an extensive matrix of variables that interact in complex ways to make schooling more or less effective. Among bilingual schools in every country, there is often a mixture of the outstanding and the ordinary, those in an upward spiral of enhancing their quality, and those that depend on past glories rather than current successes. The school effectiveness research movement has located many of the important factors that make such schools more or less effective (August and Hakuta, 1997). Bilingual education is only one ingredient among many.

Another limitation of the pedagogical perspective on bilingual education is the nature and use of language learned at school. Canadian research suggests that the language register of formal (e.g., immersion) education does not necessarily prepare children for language use outside the school (Cummins, 2000). The language of the curriculum is increasingly complex and specialized. The vernacular of the peer group and the lingo of the street is different. Canadian children from English-speaking homes who have been to immersion schools and learnt through the medium of French and English sometimes report difficulty in communicating appropriately with French speakers in local communities. Local French speakers can find such students' French too formal, awkward, or even inappropriate.

A further concern about bilingual education is that language learning may stop at the school gates. The minority language may be effectively transmitted and competently learned in the classroom. Once outside the school gates, children may switch into the majority language for reasons of status, acceptance by peers, and inclusiveness in peer relations (that is, the majority language is often the 'common denominator' language). Thus, the danger of bilingual education in a minority language is that the language becomes a language of school but not of play; a language of the content delivery of the curriculum but not of peer culture. Extending a minority language learnt at school to use in the community over the teenage and adulthood years is something that is difficult to engineer, difficult to plan, but nevertheless vital if that language is to live outside the school gates.

Bilingual Language Development: Early Years

A De Houwer, University of Antwerp, Antwerp, Belgium

© 2006 Elsevier Ltd. All rights reserved.

Scope

The present article summarizes scientific insights about the acquisition of two languages by children under the age of 6 who have been regularly addressed in these languages from birth. This restriction in terms of the age of first regular exposure allows for a comparison with children raised monolingually from birth, so that it becomes possible to outline major differences and similarities between the processes of early monolingual and bilingual development. This in turn should allow us to address the question whether the number of languages learned has any strong effects on basic processes of early language learning that have hitherto been posited for child language acquisition in general.

This article will not discuss the acquisition of the same two specific languages by one child or group of children. Instead, it tries to draw together findings from different pairs of languages-in-acquisition that appear to hold for all or most of the different pairs investigated. The focus is on language development in normally hearing children growing up in nurturing and stimulating environments who have no obvious physical, psychological, or neurological problems.

Variation in the Input as Key Factor in the Study of Bilingual Children

Children who are addressed in two languages from birth undergo a process of what has been called Bilingual First Language Acquisition (BFLA, cf. Meisel, 1989, De Houwer, 1990). These children have two first languages: A and Alpha. On the one hand, their experience with languages A and Alpha resembles that of monolingual children in that they have never known a time that A or Alpha were not present in their environment. On the other hand, their language experience differs substantially from that of monolingual children, because children raised bilingually have never been in a purely monolingual situation for any length of time. Rather, they are used to hearing a much wider range of variation in the speech addressed to them than any child raised monolingually.

In studies of monolingual children, the aspect of variation in the input has on the whole received fairly little attention. Where it has, the focus has mainly been on frequency differences in the use of similar structures and forms by different people (see Hart and Risley, 1995), and not on, for instance, regional dialect differences between a child's two parents. Typically, it is implicitly assumed that the language heard by a young child in a monolingual setting is fairly uniform, and the possibility of sociolinguistic variation is mostly not addressed. Even though the people addressing an infant may speak differently (mother on the one hand, four-year-old sibling on the other, for instance), such differences are either not taken into account, or, at best, are seen as stylistic variations of one and the same linguistic system. The question is not asked whether the child initially knows that these are stylistic variations of what can be seen as basically the same system, rather than two quite different ways of speaking that form distinct although on some points comparable systems. Instead, in spite of models of piecemeal learning (cf. for instance Fletcher, 1985) or instance-based learning (e.g., Durieux and Gillis, 2001), it is more generally assumed that children raised in a monolingual setting are on their way toward learning one single, closed, rule-based system (however complex). Any forms the child produces that appear not to fit this target system are seen as temporary deviations from that one system. Even in generative approaches, it is assumed that from early on the child 'knows' he or she is dealing with just one language, and everything the child does linguistically is interpreted as a function of this one linguistic system. The boundaries of the system itself are not under scrutiny, but are taken for granted and not usually the subject of discussion. And, indeed, if there is one aspect of early child language that is striking when one compares different languages-in-acquisition in monolingual settings, it is the fact that even young children's speech is

Scope

The present article summarizes scientific insights about the acquisition of two languages by children under the age of 6 who have been regularly addressed in these languages from birth. This restriction in terms of the age of first regular exposure allows for a comparison with children raised monolingually from birth, so that it becomes possible to outline major differences and similarities between the processes of early monolingual and bilingual development. This in turn should allow us to address the question whether the number of languages learned has any strong effects on basic processes of early language learning that have hitherto been posited for child language acquisition in general.

This article will not discuss the acquisition of the same two specific languages by one child or group of children. Instead, it tries to draw together findings from different pairs of languages-in-acquisition that appear to hold for all or most of the different pairs investigated. The focus is on language development in normally hearing children growing up in nurturing and stimulating environments who have no obvious physical, psychological, or neurological problems.

Variation in the Input as Key Factor in the Study of Bilingual Children

Children who are addressed in two languages from birth undergo a process of what has been called Bilingual First Language Acquisition (BFLA, cf. Meisel, 1989, De Houwer, 1990). These children have two first languages: A and Alpha. On the one hand, their experience with languages A and Alpha resembles that of monolingual children in that they have never known a time that A or Alpha were not present in their environment. On the other hand, their language experience differs substantially from that of monolingual children, because children raised bilingually have never been in a purely monolingual situation for any length of time. Rather, they are used to hearing a much wider range of variation in the speech addressed to them than any child raised monolingually.

In studies of monolingual children, the aspect of variation in the input has on the whole received fairly little attention. Where it has, the focus has mainly been on frequency differences in the use of similar structures and forms by different people (see Hart and Risley, 1995), and not on, for instance, regional dialect differences between a child's two parents. Typically, it is implicitly assumed that the language heard by a young child in a monolingual setting is fairly uniform, and the possibility of sociolinguistic variation is mostly not addressed. Even though the people addressing an infant may speak differently (mother on the one hand, four-year-old sibling on the other, for instance), such differences are either not taken into account, or, at best, are seen as stylistic variations of one and the same linguistic system. The question is not asked whether the child initially knows that these are stylistic variations of what can be seen as basically the same system, rather than two quite different ways of speaking that form distinct although on some points comparable systems. Instead, in spite of models of piecemeal learning (cf. for instance Fletcher, 1985) or instance-based learning (e.g., Durieux and Gillis, 2001), it is more generally assumed that children raised in a monolingual setting are on their way toward learning one single, closed, rule-based system (however complex). Any forms the child produces that appear not to fit this target system are seen as temporary deviations from that one system. Even in generative approaches, it is assumed that from early on the child 'knows' he or she is dealing with just one language, and everything the child does linguistically is interpreted as a function of this one linguistic system. The boundaries of the system itself are not under scrutiny, but are taken for granted and not usually the subject of discussion. And, indeed, if there is one aspect of early child language that is striking when one compares different languages-in-acquisition in monolingual settings, it is the fact that even young children's speech is

highly language-specific in terms of the early production of phonological and morphosyntactic elements (compare, for instance, the acquisition of Inuktitut, Turkish, and Dutch; see Allen, 1997, Aksu-Koç, 1988, and De Houwer and Gillis, 1998, respectively).

One could extend the same logic to all children, regardless of the extent of variation they encounter in the input. It is theoretically possible that all children start out with the assumption that everything they hear must be fit into one linguistic system. Children growing up bilingually would in this view be expected to first produce speech that combines elements from both languages, perhaps steered by cognitive operating principles as originally proposed by Slobin (1973). At the level of words, they might generally combine phonemes from both languages in one word. At the level of early sentences, attempts to weld the large range of perceived variation into one system would result in utterances that seemingly quite arbitrarily mix morphemes and words from both languages together in one utterance. Although this view, expressed most strongly and influentially by Volterra and Taeschner (1978), has held quite a long reign, the empirical evidence to date shows that this is not how young bilingual children generally speak. Rather, from the outset of even somewhat intelligible speech, children raised with two languages from birth mostly produce utterances that can be related to just one of either of their input languages (see, e.g., Quay, 1995, Lanza, 1997, Johnson and Lancaster, 1998, Sinka and Schelleter, 1998).

If children everywhere were indeed to start out with a learning assumption that they are dealing with one single linguistic system, the early language-specific utterances in each of two languages by children raised bilingually cannot be explained. The very existence of these early language-specific utterances in two languages in fact goes against the notion that a single system assumption drives language acquisition. From early on, bilingual children are able to determine that the huge range of variation in speech sounds that they are exposed to can be categorized according to two main categories, two main ways of speaking. To learn to understand these two ways of speaking and to learn to speak these two languages, children must know the boundaries between them. This raises the question of how children learn where one language stops and another one starts. In studying bilingual development, then, the issue of boundaries between languages is a crucial one.

Bilingual Input

For there to be a chance for children to learn to distinguish both languages from each other, there must in fact be two separate languages in the input. That may sound obvious, but is not quite: input might be characterized as 'bilingual' if it routinely contains elements that can be described as historically related to two distinct languages. This kind of input occurs, for instance, when young children grow up in bilingual communities where in the personal domain code-switching is the norm (see, e.g., Romaine, 1995: 120 ff.), and virtually every utterance heard by the child contains elements that linguists would describe as belonging to two languages. In this kind of setting, there is no clear differentiation between two ways of linguistic communication that children need to learn to understand and later produce. Children who only hear such code-switched or mixed utterances are not exposed to two separate languages. Thus, they are not actually growing up bilingual.

For input to be considered bilingual, it must include a sizable proportion of unilingual utterances in language A and of unilingual utterances in language Alpha. In addition, there may be mixed utterances, too, i.e., utterances with elements from both language A and Alpha. It is not possible to specify more detailed norms concerning, for instance, the maximum proportion of mixed utterances allowed. First, any cutoff points here would have to be arbitrary. In addition, the proportion of mixed utterances may change quite drastically over the child's life. After all, bilingual settings are usually dynamic and changing, with one of the languages present more strongly than the other in time period 1, and the other way round in time period 2, for instance. All this will depend on the people interacting with the language-learning child and their movements.

There are various ways in which each language can be offered to a young child growing up hearing two languages from birth. Typically, however, the two languages will be used by members of the child's family. If this is not the case, we would usually be dealing with the acquisition of a second language some time after the child has been in a monolingual situation. Three main input types exist in cases of BFLA: (1) every person in the child's environment mainly speaks one language to the child, but combined, these people address the child in two languages ('one person, one language'); (2) every person in the child's environment speaks two languages to the child, and (3) a combination of types (1) and (2). Reports from the literature, informal observation, and unpublished analyses of survey data based on language use in 2250 bilingual families (De Houwer, 2003) suggest that case (3) is the most common. Typically, a child growing up with two languages from birth will hear some people speak just one language, and will hear others speak two languages.

Regardless of which input type a child finds herself in, a typical characteristic of bilingual input is that it is not evenly distributed over the two languages. At any given time, one language will generally be more strongly present than the other one. The balance may change with time, so that a language that is more strongly present in the input in the first year of life is less strongly present later on, for instance. The relative strength of one language compared to the other depends on the number of people speaking it, the variety of different contexts in which it is spoken, and the frequency with which it is spoken. Even if there is only one person in the child's environment who speaks language A, this language may be far more strongly present than language Alpha (spoken by everyone else) if that person spends a great deal of time with the child and speaks a lot to the child.

The fact though that in many cases the 'carrier' of one of the child's languages may be limited to just one person does mean that a bilingual input setting can be quite fragile: if that one person disappears for some reason, the child's language environment changes quite dramatically from bilingual to monolingual.

The question is of course whether all these different input constellations have an effect on the learning of the two languages by the child. There has unfortunately been no systematic study of this. Most in-depth studies of early bilingual development have focused on children growing up mainly in a 'one person, one language' setting (but see Deuchar and Quay, 2000 for a study of a child in input type (3)). In addition, most of the detailed studies available have taken children who actually speak two languages, and who have on the whole heard them in roughly equal proportions. There are a few studies that have looked at children raised in situations where one language was clearly much less strongly present than the other (e.g., Schlyter, 1993), but the data are too scarce to draw any conclusions in terms of the relationship between input type and acquisitional paths.

One feature does appear to be quite robust, though. This is the fact that temporarily dramatically increased input in one of their languages once children have started to talk, combined with the communicative need to use that language, leads to highly increased and more proficient use of that language in a matter of days or weeks. This phenomenon was already noted by Werner Leopold, who has carried out the most detailed study of a bilingual child's development (Leopold, 1970 c. 1939–1949).

Bilingual Children's Language Development

It is trite to state that children all over the world will learn to speak the language they are exposed to. One might thus expect that children exposed to two languages will learn to speak the two languages they are exposed to. It turns out, however, that this is not the case. Quite a lot of children growing up with two languages from birth speak only one language (unpublished data from a survey of approximately 2250 bilingual families carried out by the author suggest that about 1 in 5 children growing up bilingually fail to speak one of the languages they heard from birth; for information on the survey, see De Houwer, 2003). While children growing up bilingually may not learn to actually speak two languages, they apparently do learn to understand two languages: There are no reports of children growing up with two languages who only learn to comprehend one language. This sharp difference between production and comprehension abilities confirms the strong disassociation that has been found between early production and comprehension in some monolingual children (see, e.g., Bates, Dale, and Thal, 1995).

Only a small portion of the possible pairs of languages-in-acquisition has been studied. Published reports are available on approximately 14 different combinations (De Houwer, 2005). Given the estimated 6000 languages in the world, this is of course an extremely small subset of all the possible combinations. Yet, in spite of the highly limited data set, there is a perhaps surprising 'unity in diversity', i.e., similar general results are found.

When bilingual children do speak two languages, they do this in a way that strongly resembles how monolingual children speak each of these languages. In each of their languages separately, then, bilingual children under age 6 sound mainly like monolingual children. In each of their languages, they make similar errors, substitutions, deletions, and they produce a similarly limited repertoire in comparison with adult language use.

The 'milestones' of bilingual development and their timing are the same as those for monolingual children. Bilingual children's comprehension precedes their production, babbling is typical toward the end of the first year, then comes a period in which single-word utterances are produced, to be followed by a short or drawn-out period of two-word utterances. Then come multiword utterances, soon to be followed by multiclausal ones. There is no evidence that the fact that children growing up with two languages have to process more variation in the input has an effect on the rate of acquisition: on

the whole, bilingual and monolingual children reach the milestones of development within similar age ranges.

Whenever more detailed aspects of language use have been compared between monolingual and bilingual children, no qualitative differences have been found. In the area of phonology, bilingual children start out using substitution, deletion, and suppletion patterns that have been found for monolingual children, too. Semantic processes found for monolingual children such as underextension and overextension also appear in young bilingual children. Just as is the case for monolingual children, bilingual children's lexicons grow steadily as they get older, and they do so in two languages. In morphosyntax, children make similar errors and produce similar types of utterances at about the same age for one particular language regardless of whether they are monolingual or bilingual (see, e.g., Almgren and Barreña, 2000, De Houwer, 1990, and Meisel, 1985; for a more detailed comparison of monolingual and bilingual acquisition, see De Houwer, 2002).

Bilingual children differ from monolingual children, however, in that they produce mixed utterances in addition to unilingual utterances in each of their two languages. This occurs from the beginning of speech production onward. Usually, the mixed utterances that young bilingual children produce could have been produced by bilingual adults, too, and often concern the insertion of a noun from language A in an utterance that is otherwise entirely in language Alpha. Occasionally, this inserted noun (or other word class, as the case may be) may be affixed to a bound morpheme from the other language, as is possible in adult bilingual speech, too. However, the range of structurally possible mixed utterances produced by bilingual children is quite limited compared to the range in adult bilingual speech. The structure of young bilingual children's mixed utterances tends to reflect the overall structure of their unilingual utterances produced at about the same age.

A crucial feature of bilingual speakers, including children, is that for every utterance they produce they must make a choice: either the utterance will be unilingual in language A, unilingual in language Alpha, or mixed, combining elements from languages A and Alpha. The actual choice made will depend on what is socially appropriate. Young bilingual children know from early on (soon after they have started to produce intelligible speech, in the second year of life) which selection to make, depending on the sociolinguistic norms they have been socialized into. children as young as 1 year and 3 months and growing up in a 'one person, one language' situation have been reported to use language A exclusively with monolingual speakers of language A, and language Alpha with monolingual speakers of language Alpha (Sinka and Schelleter, 1998). Such high sensitivity to the language choice of their addressees, and the ability to accommodate to this language choice, show a level of sociolinguistic and pragmatic sophistication that is usually not seen in monolingual children until at least a year later. The use of mixed utterances can also be explained in terms of this sensitivity: children will use more mixed utterances, and will continue to use them, the more acceptable they are to the people in their environment. It is through language socialization practices in the family that bilingual children learn which kind of utterances they can and should use on what occasion. Another specifically bilingual feature of young bilingual children's speech is that they easily switch between unilingual utterances in language A, unilingual utterances in language Alpha, and mixed utterances. In this, they resemble bilingual adults.

Young bilingual children who have been regularly addressed in two languages from birth do not necessarily speak their two languages equally well. The literature on bilingual acquisition gives a somewhat different impression, in that most of the children studied developed their two languages at roughly the same pace, but it is well known (and also evidenced in some published reports) that a child may be much more proficient in language Alpha than in language A. This occurs especially when children are just entering the multiword stage in one of their languages. These differences in proficiency levels do not have the perhaps expected effect that the more developed language influences the less developed one. Rather, a bilingual child's two languages form two separate, closed sets as far as morphosyntax is concerned. So far, all studies of bilingual children's morphosyntactic development have provided evidence for the Separate Development Hypothesis (SDH), which states that children regularly exposed to two separate languages from birth develop two distinct morphosyntactic systems, in that "the morphosyntactic development of the one language does not have any fundamental effect on the morphosyntactic development of the other" (De Houwer, 1990: 66). From the moment that bilingual children start to give evidence of morphosyntactic elements in their lexically unilingual utterances (word order and/or bound morphology), they are guided by the structural features of just one of their input languages at a time. In effect, as far as just the combination of their unilingual utterances in language Alpha and language A is concerned, young bilingual children could be likened to two monolingual children in one. This of course is

only part of the picture, and does not take into account their use of mixed utterances, their ability to smoothly switch from one language to another, and their ability to comprehend and speak two languages.

How Do Bilingual Children Learn to Speak Two Separate Languages?

In monolingual acquisition, there is still no widely accepted explanation of how children are able to learn to speak in the early stages. This is the same for bilingual acquisition, where similar problems need to be solved, but where an additional question is how it is possible that bilingual children actually learn so early what elements in their input belong where. Clearly, bilingual children do not combine elements from both their languages at random. When they combine lexical items from one language in the same utterance, they also exhibit order patterns and/or morphological features that are not unexpected for that same language, and that are commonly used by monolingual children exposed to only that language. How do bilingual children know what belongs where?

We are far from having an answer to that question. We can assume on the basis of studies of monolingual children that on the whole, comprehension paves the way for production in bilingual children. Early perceptual studies of bilingual infants have shown that at the age of 4 months, babies can already distinguish between the rhythmic properties of their two languages (Bosch and Sebastiàn-Gallès, 2001). Is it such global differences that guide children toward representations of two different systems? Or are children more locally attuned to the way their interacting partners speak? In any case, only close attention to their input and the patterned variations in it make it possible for young bilingual children to be able to reflect that input so closely at the earliest stages of morphosyntactic production.

More detailed studies of the input in bilingual settings are needed to address these issues. Also there is a great need for more studies of the earliest stages of bilingual development. Conference papers show that such work on early stages is on the research agenda. Until a large body of published reports is available, however, any hypotheses regarding the bilingual child's 'entry' into the two ways of speaking he or she is hearing can only be speculative.

What Can Bilingual Children's Development Teach Us about the Language Development Process in General?

Given that so many of the world's children grow up with more than one language, and that early bilingualism may be even more 'normal' than monolingualism, studies of child language development should pay more attention to bilingual populations. A better understanding of bilingual development in all its different manifestations is of fundamental theoretical interest. It is also necessary to develop prevention and remediation programs to help children who may experience problems with learning language. Understanding bilingual development may in addition shed light on aspects of the language development process in general that remain hidden in studies of monolingual children.

Studies of bilingual development have mostly been limited to middle class children growing up in the Western world, and to a dozen or so language combinations. It is premature, then, to regard the findings discussed as final. Yet, the findings available serve as a starting point to see what we can learn about the language development process by including findings for bilingual children.

Findings based on the study of bilingual children confirm or strengthen many basic issues in the study of child language development, and highlight some aspects of language development that perhaps have not received the attention they deserve – primarily because in monolingual acquisition they are not all that salient.

The fact that many children raised bilingually in fact do not produce two languages, but just one, quite clearly shows that children themselves are in charge in the acquisition process. Children raised bilingually who themselves speak only one language generally do fine communicatively, and have either accustomed their environment to 'bilingual' conversations, where the (at least passively bilingual) adult speaks language Alpha and the child answers in language A, or they are growing up in environments where from the beginning of the child's language production the adults did not care in what language the child spoke, because they understood both languages. These cases of passive bilingual children, who understand two languages but speak only one, offer strong support for the Intentionality Model for language acquisition that places the essential agency of the child at the center of the developmental process (Bloom and Tinker, 2002).

Whether children are hearing one or two languages from birth does not seem to play a significant role in

the overall progression of language skills. Regardless of which language is being acquired and regardless of the number of languages involved, there is a stable progression from linguistic silence to telegraphic speech to larger units to stories, with production often lagging far behind comprehension. The overall language learning process for languages heard since birth, then, is robust.

This general picture is language-specific. Children do not learn to speak 'language in general', but a specific language. This is the same for monolingual and bilingual children, at least for those bilingual children who actually speak more than one language.

Early bilingual development with its demonstration of early language-specific learning is only possible because children pay close attention to the input from early on. Although in monolingual acquisition there have of course been studies of input and its effect on learning, the findings for bilingual development suggest that the specific, local features of the input need to be given more attention in explanations of the language learning process. On the other hand, however, it is possible that bilingual children are more 'keyed in' to the input because they hear so much more variation in it. Close comparisons between monolingual and bilingual children are needed to investigate this possibility, but in any case, more investigations of the precise role that the input plays, also in monolingual acquisition, is a recommendation that follows from the findings on bilingual development.

Changes in the input can have a strong effect on bilingual children's language use: on the basis of a changed input condition, bilingual children can go from hardly speaking a language to speaking it fluently in a matter of days or weeks. Given this extremely strong effect in bilingual settings, changed input conditions have not received as much investigative attention in monolingual acquisition studies as they deserve. If children can change so fast in response to changed input conditions, as evidenced in studies of bilingual children, then perhaps in a monolingual situation sudden increased or more varied input can help to account for more subtle changes in a child's language use, such as an increase in long utterances, for instance.

Studies of bilingual children invariably highlight the fact that sociolinguistic context is a main determinant of language use. A particular sociolinguistic context can determine whether a child will speak a particular language or not. Given that in bilingual settings the effect of a particular sociolinguistic context can be so large, it may have more influence in a monolingual setting than is usually acknowledged. Particularly in the setting up of experiments, the sociolinguistic context should be carefully constructed, and it should not be overlooked as a potential explanatory factor for perhaps unexpected results. In more naturalistic settings, sociolinguistic context may also explain variations in language use in monolingual children.

On the whole, the study of bilingual children inevitably draws attention to individual variation as a correlate of variation in the input. In my view, the field of child language research in general would benefit from a generally closer attention to variations in the input even in monolingual settings. It may hold the key for explanations of language behaviors that otherwise remain elusive.

Introduction

A bilingual dictionary is a dictionary that presents the lexicon and phraseology of one language (called the **source language**) and translates these components into a second language (the **target language**). This element of translation is essential. By way of contrast, a dictionary that uses a foreign language to describe the features (e.g., etymology) of another language is not a bilingual dictionary because it does not directly help the user to translate.

There are many different sorts of bilingual dictionaries. Arrangement is either alphabetical or thematic. In the case of languages such as Chinese that have an ideographic rather than alphabetical writing system, the arrangement is in brush-stroke order (*see* **Chinese Lexicography**). The most common type, **general bilingual dictionaries**, are aimed at a broad user group that ranges from language students to translators, business people, travelers, and others. Since a bilingual dictionary is above all a practical tool, it almost invariably consists of a single volume and is often (but not always) divided into two parts – the source language of the first part becomes the target language of the second part, and vice versa. Bilingual dictionaries vary greatly in size and content. The smallest pocket bilingual dictionaries give little more than undifferentiated one-word equivalents or short lists of possible one-word translations; the largest give a great deal of information for both source and target languages about phraseology and the contextual appropriateness of possible translations. For a large number of language-specific and general articles on the subject of bilingual dictionaries, see Hausmann *et al.* (989–1991). Also, to complement the present article's survey of bilingual dictionaries' general aspects, see articles in this encyclopedia for detailed comments on lexicography in particular languages.

With bilingual dictionaries now having been developed in electronic format, the distinctions between alphabetical and thematic arrangements are not so relevant: full-search text and thematic searches are now possible at the click of a mouse.

A Brief History of Bilingual Lexicography

The history of bilingual dictionaries is intimately linked to the history of translation and to the creation of vocabulary lists that give equivalents in a different language. Berkov (1973) even regards bilingual lexicography as integral to the theory of translation. The history of translation, in turn, is intimately interwoven with the spread of trade and religion.

There is some debate among historians of lexicography as to what came first, monolingual or bilingual dictionaries. In ancient Mesopotamia, bilingual dictionaries (or their ancestors, i.e., lists of words with foreign-language equivalents) came after the first monolingual protodictionaries (i.e., monolingual word lists with added information). The most ancient traces of anything resembling a bilingual dictionary are found in fragments of Sumerian–Eblaitic tablets dating back to the 24th century B.C., discovered in Ebla in 1975. Words from the two source languages were mixed together in a single column. Presumably, it was assumed that users would need no assistance in distinguishing between Sumerian and Eblaitic.

Other bilingual, and sometimes trilingual and even quadrilingual, lists with combinations such as Sumerian/Akkadian, Sumerian/Ugaritic, etc., were found by archaeologists in Mesopotamia. Of great importance is the medium on which the lexicographic data are stored. For example, no bilingual Egyptian/Aramaic word lists have been found to date, perhaps because they were written on a more perishable medium than clay tablets, e.g., papyrus, not because no word lists were created. The earliest dictionary-like document found in ancient Egypt was a Greek > Coptic glossary dating back to the second half of the 3rd century A.D. Also found were Latin > Coptic glossaries and Coptic > Arabic glossaries.

Ancient Greek lexicography – entirely monolingual – started in the 5th century B.C. with glossaries explaining already rare or obsolete archaic words in Homer. The Greeks evinced very little interest in the language and culture of other peoples. In fact, the impetus to the influence of Greek culture on Roman civilization came from the Roman conquest of Greece (143 B.C.) Learning the Greek language and reading the classics in Greek became a central part of every civilized Roman's education and, naturally, dictionaries played their part. Thus, the western tradition of bilingual dictionaries can be traced to the desire of the Romans to read Greek. Classical Greek–Latin and Latin-Greek dictionaries were plentiful, though unfortunately all are lost except for a few fragments, surviving mostly in Egyptian papyruses (Kramer, 2001) (*see* **Greek Lexicography, Classical; Latin Lexicography**).

In China, monolingual lexicography – in the form of inventories of Chinese characters dating from the

Han dynasty (206 B.C.–A.D. 220) – also came first, preceding bilingual lexicography by nearly two millennia. The earliest bilingual dictionary with Chinese as a source language is Robert Morrison's Chinese–English dictionary of 1815 (*see* **Chinese Lexicography**). In recent decades, the growth in international trade with China plus the presence of many Chinese-speaking communities outside China have led to unparalleled growth in bilingual dictionaries in which Chinese is both a source and a target language. Since the 1980s, bilingual lexicography in China has been booming, largely as a result of the 'open-door policy,' that has led to the rapid growth both of literacy and the number of foreign language learners.

In Japan, the rise of lexicography was closely associated with the importation of Buddhism from China via Korea in the 7th century A.D. (*see* **Japanese Lexicography**) Buddhist monks learned to use Chinese monolingual dictionaries for religious purposes. Chinese characters were adapted to represent the Japanese language, which at that time had no indigenous writing system. In the 10th and 11th centuries a number of Chinese–Japanese character dictionaries were compiled, some of them very large indeed (30 volumes). The earliest bilingual dictionaries offering translations of Japanese into a Western language (Portuguese) were compiled by Jesuit missionaries at the end of the 16th century. During the Edo Period (1600–1868), Japan was closed to the outside world, with one exception: trade with the Netherlands was permitted. As a result, in 1796 Inamura Sanpaku compiled a Dutch–Japanese dictionary on the basis of Halma's 1708 Dutch–French dictionary. In the 20th century, bilingual lexicography began to flourish in Japan, with the production of many Japanese–English dictionaries. Other languages were not neglected. Currently, one of the most imaginative projects is the Saipam Japanese–Thai dictionary project, an online cooperative effort of Thai professionals working in Japan, to which the dictionary users themselves are invited to contribute.

In the Arab world, too, bilingual dictionaries did not appear until long after monolingual dictionaries. They were compiled mostly by nonnative speakers of Arabic from societies that were in contact with Arabic speakers, for example, speakers of Persian requiring access to Arabic as the language of the Koran (*see* **Arabic Lexicography**).

As for Hebrew, the situation was different. The first dictionary of Hebrew, by Saadia Gaon (Babylonia, 902), was written with Arabic as the target language, so it can be considered as a bilingual dictionary. The first monolingual Hebrew dictionary is that of Menahem ben-Sarouq (Spain, mid-10th century) (*see* **Hebrew Lexicography**).

During the Middle Ages, bilingual dictionaries developed in western Europe in connection with Latin, the language of the Christian Church. The Roman Catholic scriptures were in Latin, and clerics would **gloss** Latin words, adding vernacular translations between the lines, and later grouping these translations in **glossaries**, which can be considered as the ancestors of European bilingual dictionaries. The *Abrogans*, the first alphabetical Latin–German dictionary (so named after its first entry), was commissioned by Bishop Arbeo around 765–770 (*see* **German Lexicography**). It was used as a basis for subsequent spinoffs, in which German, the target language, was replaced by translations in other languages.

Until the invention of the printing press in 1436 by Johannes Gutenberg, books, including dictionaries, were either manuscripts or were printed from hand-carved wood blocks. These objects were rare and costly. With the invention of printing, books suddenly became more accessible to a much larger audience, and this had a profound effect on the spread of knowledge and culture during the Renaissance. Without the printing press, dictionaries could not have been widely available; without dictionaries, the effortless spread of Renaissance culture and scholarship across linguistic boundaries would have been greatly inhibited.

Bilingual dictionaries in Renaissance Europe were based mainly on Latin, at a time when Latin was the common language of all learned people, whatever their native tongue. Inevitably, therefore, Latin was both the source and target language of many dictionaries. A major milestone was Robert Estienne's *Dictionnaire Françoislatin* of 1534 (*see* **Stephanus, Robertus (ca. 1503–1559)**), in which French words are described in French and a Latin translation is given. New types of dictionaries free of Latin also appeared at that time. The first non-Latin-based bilingual dictionary in Europe was probably Adam von Rottweil's Italian > German thematic dictionary *Introito e porta*, dating from 1477, followed closely by a French–English vocabulary printed by Caxton in 1480.

In the 17th century in Europe, the main core of bilingual dictionaries contained French or English, but new combinations also appeared, for example, those including Dutch or Spanish.

The age of Enlightenment that followed was also the age of encyclopedias (*see* **Encyclopédie**), ambitious projects with the stated aim of collecting the entire sum of existing knowledge. One aspect of this quest had a considerable influence on bilingual

lexicography, namely the ambition to collect and classify the entire vocabulary of all the languages spoken in the world. This ambition is still unfulfilled – as the postings on the *lexicographylist* website show very clearly. This discussion group contains frequent references to examples of a race against time to record the vocabulary of endangered languages before it is too late. This record is generally done in the form of a bilingual dictionary, with detailed information about the vocabulary and syntagmatics of the source language, with English (or occasionally Spanish, Brazilian Portuguese, or Russian) as the target language. Bilingual lexicographers working with rare and endangered languages often find themselves devoting a great deal of attention to establishing written norms for a language that has no written tradition. The motivation is very often the facilitation of missionary work (usually Christian). In other cases, the aim is more practical, namely to create access for speakers of a rare language to English or to some other international language of trade and technology.

In 19th-century Europe, the production of bilingual dictionaries increased greatly with all sorts of combinations, including dictionaries of newly discovered 'dead' languages, e.g., several Sanskrit–English dictionaries [in particular those of Wilson (1819) and Monier-Williams (1872)] and other combinations such as the *Hebräisch-chaldäisches Wörterbuch* of Wilhelm Genesius (1810). As did colonial expansion and evangelization, political events created conditions that required new publications. The latest in Europe was the creation of the European Union, which now includes 25 countries and 21 languages. In principle, all the documents and transactions of any of these countries must be translated into the languages of all the others.

The Techniques of Modern Bilingual Lexicography

The Three Steps to Making a Dictionary

Recent advances in technology have had a profound influence on not only monolingual lexicography but also bilingual lexicography. The use of electronic corpora (*see* **Corpus Lexicography**) has affected, in particular, both the analysis of the source language and the choice of translation equivalents. Bilingual dictionaries are normally synchronic dictionaries, representations of a language in its present state rather than its historical record. In order to make access to the information easier, meanings are generally ordered by frequency, starting with the most frequent sense in current use.

According to Atkins (1990), the production of a bilingual dictionary can be divided into three main stages:

1. **Analysis of the source language**: This stage is performed by lexicographers who analyze their native language and produce a detailed, structured account of each lexical item (word, phrase, or morpheme). This account of the source language is called the **framework.** It is more than a monolingual dictionary: it is designed to help in the subsequent stages of work, notably translation. It must be reasonably succinct, but nevertheless contain enough information to ensure that translators will have the right connotational contexts, without which their work could be inaccurate or misleading. The framework must also contain many examples of phraseology typical of the way the word is normally used, as well as any other information that will facilitate the next stage, called the **transfer.**
2. **Transfer**: This stage is the translation stage: the meanings of words and their contexts are translated into the target-language system. At a glance, it looks simple, particularly because the lexical units or phraseological items tend to be short. In fact, however, it is an extremely complex task, not least because different translation equivalents of a given word need to be chosen in different contexts, and in some cases there is no direct translation equivalent, so a circumlocution must be found. Only the best of translators (working in their native languages) satisfactorily produce results comprehensive enough to cover the needs of the wide variety of dictionary users. Part of the difficulty lies in achieving the right level of generalization: ideally, the translations should accurately reflect the source-language item, making it safely usable in many contexts. The final product of this stage is the **translated framework.** This framework is an extremely rich bilingual resource, but much too rich for a dictionary. For one thing, much of the information is specific only to certain contexts, so it needs careful trimming and generalizing. Consequently, only 30–40% of the material in the translated framework actually appears in the published version – the 'synthesized' version – of the *Oxford-Hachette French Dictionary on CD-ROM*, 3rd edn. (edited by Marie-Hélène Corréard and Valerie Grundy, 1994).
3. **Synthesis**: During synthesis, the translated framework is cut to size and reorganized into manageable, readable dictionary entries. Editors work in pairs: an editor whose mother tongue is the source language works with a target-language speaker. Editors use all sorts of conventional

resources (other dictionaries, encyclopedias, reference books, and glossaries) and, in some cases, draw upon the skills and knowledge of specialist consultants in technical areas such as the terminology of medicine, law, business, or science. Of course, they also have access to corpus data.

Using Corpus Data in Bilingual Lexicography

Since about 1990, lexicographers have been able to use evidence from electronic corpora (collections of millions, indeed hundreds of millions, of words in the texts available in machine-readable form). Some have pointed out that the World Wide Web itself can be regarded and (up to a point) processed as a vast electronic corpus (Grefenstette, 2002; Kilgariff and Grefenstette, 2003). The effects have been dramatic. Using a simple concordancing program, lexicographers can inspect 'at the press of a button' all the occurrences in a corpus of a particular word or phrase, together with the contexts in which it occurs. At last, lexicographers have easy access to enough evidence about words, thus allowing them to describe the normal meaning and use of words with reasonable confidence and without relying on introspection. This makes the job both easier and more rigorous.

Bilingual lexicographers can approach corpora in two different ways: either as parallel corpora or comparable corpora. Each approach has its advantages and disadvantages. Parallel corpora consist of original texts alongside target-language translations, aligned as far as possible sentence by sentence. These allow instant access to translations and instant comparisons to the original texts. However, a translation is inevitably a text written under the influence of another language, and a translated text is only as good as its translator. The danger of interference from the idiom and syntax of the source language is ever present. Comparable corpora, on the other hand, are collections of texts with similar contents in both languages; though related more loosely, these texts were produced for their own sakes, i.e., independently, not in relation to a source text in a foreign language. However, comparable corpora also require extra work of lexicographers; without a ready-to-use solution, they must search around similar themes in their hunt for translation equivalents.

Corpus data can be used at all stages of bilingual lexicography. It is particularly useful for finding complementation patterns and typical collocations and for ordering meanings during the analysis of the source language. As for transfer, a source-language corpus can be used to find a variety of occurrences against which the translator can test potential translations in order to decide which is the most appropriate, because concordances and statistical tools show very clearly the differences between frequent and rare expressions, and between conventional and rare-but-possible phraseology. A source-language corpus also allows the translator to check connotations. If a comparable corpus is available, the translator can also check possible translations in the target-language corpus (which is composed of texts produced in the target language) and look at the best possible fit between the source-language lexical item and equivalents in the target language.

During synthesis, the final editing stage, corpora help lexicographers to select and keep what is most useful, both in source and target languages. As a result, users will be more likely to find a correct and useful translation, rather than one with fewer relevant possibilities that are based in lexicographical introspection.

Working with Frameworks

Theoretically, frameworks created by source-language lexicographers are independent of a target language. In real life a framework is often created for a given bilingual pair and the word list is devised accordingly. Once a framework is ready for translation, it can be reused with a different target language. Obviously, it will need to be translated again, and also edited (trimmed) again, because the fit of one language with another differs. An English framework used for an English > French dictionary can be used for an English > Polish dictionary, for instance, but some editing will be needed to ensure that the translations are useful in the new configuration and that enough translations are supplied.

Structure of a Bilingual Entry

The structure of a bilingual entry ranges from very simple (e.g., a monosemous regular word in the source language is translated by a monosemous word in the target language, with no irregularities) to very complex. In the pages explaining the structure of entries, taken from the second edition of the electronic version of the *Oxford-Hachette French Dictionary* on CD-ROM, 3rd edn. (published in 2003 by Oxford University Press), the various elements of a bilingual entry are shown.

The first element is the headword. This has to be a recognizable form of the lemma that users will search for (the **citation form**). Conventions regarding citation forms vary from language to language. For

instance, for most European languages verb headwords are given in the infinitive, but in Hungarian they are stored under their 'simplest form,' i.e., the 3rd person singular of the present indicative, while in Greek the citation form for a verb is the 1st person singular of the present indicative.

Other facts about the headword are also recorded, aimed especially at nonspeakers of the language. A headword may have a register that is not neutral: i.e., it may be informal, very informal or vulgar, or it may be particularly formal. In the *Oxford-Hachette French Dictionary* (OHD) register is shown by a symbol denoting nonstandard language or by an abbreviation, for example *fml,* denoting formal language. Other dictionaries use other devices to give information about register. Guidance is also given on pronunciation. In OHD, the standard pronunciation of a word is transcribed in the International Phonetic Alphabet (IPA), using a broad transcription. There are many variant pronunciations of words within languages, of course, and the lexicographers have to decide how many of these should be represented. For example, should a dictionary reflect only standard British English pronunciations (so-called Received Pronunciation – RP) or should it also give U.S. variants, and if so, how many? The decision to include pronunciation variations depends on the scope and aims of a dictionary. Many bilingual dictionaries nowadays record both British and American pronunciations, but it is not normal for, say, Canadian French pronunciations to be recorded alongside metropolitan European French. Such decisions are made on the basis of an estimation of user needs.

Information is also given about inflected forms of a lemma, either explicitly within the entry or in the form of a reference to a table of verb inflections in an appendix to the main dictionary.

Dictionary entries are split into grammatical and semantic subdivisions (or categories). The main subdivisions separate one part of speech from another, if these are homographs. Within each part-of-speech bloc, different subdivisions record the different translations that are relevant in different contexts. These divisions are signposted systematically to help navigation through entries. In many dictionaries each subdivision is marked with a letter or number, which stands out on the page. Grammatical information such as part of speech is usually indicated, although some dictionaries mention it only when it is relevant for navigation or comprehension. There is also usually a direct translation of the headword in each category. There may be grammatical information about the translation such as gender or the fact that a word deviates from the norm by being invariable. There may also be register information about the translation.

If there is more than one translation equivalent and if the two translations are freely interchangeable, then they are given without discriminators. However, if they are not interchangeable, which is normally the case, then markers are added to help users select the most appropriate translation. Various kinds of discriminators are used: for example, a close synonym of the headword in the relevant context, or a pointer to some aspect of the difference, sufficient to help users in their selection of a translation. A typical collocate may also be used as a discriminator; in a verb entry, for example a typical direct object may be given (e.g., 'firing a gun' vs. 'firing a person'), while in an adjective entry, it may be the head noun that the adjective typically modifies (e.g., 'fair hair' vs. 'a fair person'). Discriminators are also used to differentiate semantic categories within an entry.

Another sort of indicator is a label showing the domain to which a particular sense of a word belongs, for example *Computer Science* or *Medicine*.

Special phraseological elements such as idioms or phrasal verbs in English are sometimes grouped together as subentries, usually at the end of an article. For nonspeakers of a language, it is important to show how the phraseology works, for example, where the direct object of a phrasal verb in English should be placed – before or after the particle.

Bilingual dictionaries are also careful to label register, in particular warning that a given item is pejorative, offensive, or taboo.

Main Issues of Bilingual Lexicography

The problems in bilingual lexicography mostly arise because any two languages are differently structured systems, which coincide only occasionally. Moreover, the structure of a dictionary encourages the belief that there are one-to-one equivalences between words in languages, which is not true in many cases. Editors of bilingual dictionaries attempt to get around this problem by translating many phrases that typically use these words. Here a tension arises between the need for economy and regularity of organization in a dictionary and the need to give as much information as possible to help users produce idiomatic translations. Bilingual lexicographers are more reliant than many would care to admit on the ability of users to perceive analogies between the examples of typical phraseology offered by the dictionary and the particular context the user is trying to generate or interpret.

Directionality

The problems just mentioned are compounded because bilingual dictionaries are aimed at a heterogeneous target audience. For example, typical users of a French–English dictionary include native speakers of French trying to understand English texts, native speakers of French trying to communicate in English, native speakers of English trying to understand French, and native speakers of English trying to communicate in French. The needs of these groups are very different.

This brings us to another dimension of bilingual dictionaries, namely their directionality. A bilingual dictionary caters to source- and target-language speakers whose needs are not identical and neither are their activities in looking up a word's translation. Native speakers of the source language are trying to write or speak the target language. They start from something they know and want to encode it into a foreign language; so, they want detailed information about the correct use of words in the target language and some help with the choice of translations. Native speakers of the target language who are trying to understand the source language, i.e., to decode it, will be satisfied with translation equivalents that explain the meaning of a word or phrase; they will be able to use the translations, build on them, and paraphrase them freely. They do not need phraseological information to help them write idiomatically. Despite this, usually for commercial reasons, large bilingual dictionaries are bidirectional, i.e., designed to serve both source and target native speakers with their conflicting interests. Bilingual lexicographers have the impossible task of finding the right balance between giving too little information and giving too much. For this reason, some dictionary publishers now publish works catering to more narrowly specified user groups, e.g., native speakers of Dutch who are writing in English.

Typically, a large general bilingual dictionary has two sections in one volume, the source language of the first section being the target language of the second section. The presence of two sections does not make a dictionary bidirectional. It is the information given in each section that will show whether the dictionary was designed principally for speakers of either the source or target language or for speakers of both languages.

When a dictionary is designed to be bidirectional, the metalanguage chosen must best serve the needs of different users. To take a very simple example (from the *Oxford-Hachette French dictionary*), the word *abstrus* in French is formal in register. French speakers know this intuitively – they don't need to be told – so the label *fml* is aimed at the English-speaking user. However, the English translation, *abstruse,* is no less formal, but now the register information must be stated in French, for French users (*sout.,* for 'soutenu'). The resultant entry is as follows:

abstrus, abstruse /apstry/, /yz/ **adj** fml abstruse *sout.*

This entry assures the user that the target-language translation is the best possible semantic equivalent and that the register is right. This basic structure can become quite complex when, for example, the target language does not have an equivalent in the same register as the source language.

Issues Concerning the Source Language

General information about inflections is usually given in appendices. In a bilingual dictionary, individual words often need extra information, for example, the conjugation pattern number for French verbs or the stress pattern for nouns and verbs in Russian. For practical reasons, this translation information typically appears in the 'wrong' section of the dictionary, i.e., under the source language, whereas most users would ideally prefer to see it given as part of the target language. Although this arrangement saves space and streamlines the entry (because the information is given only once), it means that the user, having found a particular translation in the target language, must then go to the other half of the dictionary to find out about gender, declension, pronunciation, etc.

Some of these issues – regarding the inclusion of headwords and information about headwords – are very similar to those of monolingual dictionaries. But even the issue of the headword list is more complex in bilingual lexicography. It is connected, in a very practical fashion, with how the dictionary is intended to be used. What sort of tool will it be? A decoding (passive) tool, an encoding (active) tool, or both, with speakers of both languages dipping into it? Inclusion decisions have to be made about such matters as proper nouns (names), morphological variations, specialized vocabulary, archaic words, dialect variations.

To convey the conventions of a language to non-speakers, many bilingual dictionaries contain not only general vocabulary words, but also proper names. For example, *William the Conqueror* is *Guillaume le Conquérant* in French; the German town of *Aachen,* known as *Aachen* in English, is *Aix-la-Chapelle* in French; the Russian composer known as

Shostakovich in English is written *Chostakovitch* in French.

Other inclusion questions are strictly about the source language, still seen through the eyes of a nonspeaker. How should multiword expressions be dealt with? Should they be treated as separate entries, or nested under one of the elements and, if so, which? How should regular morphological derivation be represented? In Slavic languages diminutives are morphologically regular and are common in spoken language. Should diminutives be included even if their translations are identical to those of the standard word from which they are derived? Should archaic or rare words be included in the headword list? Should dialect variations? Where should phrases and idioms be entered? Should they be entered in a canonical form, or in the form of an example of actual usage? Should there be crossreferences to the actual location of a phrase from its components? It is impossible to predict where nonspeakers of a language will search for a phrase, and there is always the problem that they may not recognize a phrase as a lexicalized item at all. Even with the technological support and unrestricted space that an electronic dictionary can provide, these are issues that need to be addressed in a principled way. Often, there is no one right answer. Different dictionary editors make different decisions, depending on how they see their users' needs.

Issues Concerning the Translation Process

Along with coverage and presentation of information, it is the quality of the translations that determines the value of a bilingual dictionary. Depending on the activity of the user (encoding or decoding), the translations must be easily usable and preferably innocuous, that is to say, supplied with sufficient information/signposting to ensure that a nonspeaker of a language will be able to make correct translation choices.

Just as the analysis of the source language is performed at word level, a dictionary translation is expected to reflect the normal behavior of words. Unlike the translator, the bilingual lexicographer must work with very little context given and must select a large array of potential real contexts. The strategies used for the translation of continuous text (or speech) are not applicable for dictionaries. It is impossible to work at sentence level, let alone paragraph. Selecting the right translation in a context is a complex task. In a dictionary it is even more complex, because of the element of generalization. The foreign-language equivalent must be valid in as many contexts as possible, and the lexicographer cannot possibly predict all the contexts in which any given word will be used.

Several situations are possible, as summed up by Bo Svensén (1993).

The first case is when the source word is monosemous and has a monosemous equivalent in the target language, e.g., *squirrel* = *écureuil*. However, even in this simple case, some information is necessarily omitted. A person living in France, for instance, will have a mental representation of a red squirrel, whereas someone living in the U.K. or the U.S.A. will most likely visualize a grey squirrel. This does not matter as long as the same word applies in both cases.

The second case is when the source word is polysemous and has a polysemous equivalent with the same structure of meaning in the target language, e.g., *column* = *colonne*.

The third case is when the source word is polysemous and each meaning has a different translation equivalent. It is then necessary to signpost the translations for source-language speakers who need to select the appropriate one for their context, as shown in a simple entry from the *Oxford-Hachette French Dictionary* below:

blaireau, pl **blaireaux** /blɛʀo/ **nm**
1 (animal) badger;
2 (pour rasage) shaving brush;
3 (pinceau) badger-hair brush.

Things get more complicated when the relationship between the words in a source language and the translation equivalents in the target language are not in a one-to-one relationship – e.g., the French word *gâteau* corresponds to *cake, gateau,* or *biscuit* in English – or where the concept of the source language does not exist in the target language, e.g., the terms *Miranda warning* and *Miranda rights* in American English, which do not have an equivalent in French and other languages.

Other situations can arise: a word in the source language may need several translation equivalents because the target language does not have a term at an equivalent level of generalization; it requires more specific categorization. For example, the English phrasal verb *go away* cannot be translated into Russian with a single one-for-one equivalent. The appropriate Russian translation differs from case to case, because a verb denoting a specific manner of motion must be selected: on foot, on horseback, by transport, by plane, by swimming, or whatever.

Technical terms are also a source of difficulty, particularly in areas where cultures/systems are very different, e.g., law terms, even simple ones, like French *avocat,* which (according to context) may

be equivalent to English *lawyer*, *barrister*, *solicitor*, or *attorney*, or indeed to some other term. Often a specialist will be needed to help find correct solutions and to include a paraphrase in the target language. LSP (language for special purposes) dictionaries, devoted to a particular doman, will usually be better than general purpose dictionaries in such instances.

When selecting a translation, lexicographical translators have to consider how usable it will be to a nonspeaker of the language. A translation may be perfect, but only within a restricted context, while another one may be more general. In such a case, the dictionary translator/lexicographer will tend to select the more general one. Ideally, both will be given, signposted to help the user select the right one for the right context. However, space constraints do not always allow for the inclusion of multiple translations, and even if those do, there is always the danger of overloading the user with too much information and making the dictionary too cumbersome to be used effectively. For these reasons, it is often necessary to keep only one translation, the most 'all-purpose' one, which is why translations in dictionaries often seem very bland. What might be seen as a fault in a translated text is a virtue in a dictionary!

Issues Concerning the Third Phase: Synthesis

The final stage of work on a dictionary is dictated by the projected size and editorial policy of the work. What should be kept and in what form? Selecting what will remain in each dictionary article and how to organize it are activities geared towards making the user's task easier. For some language pairs it is easy to group senses together because both languages function in a similar way; for other language pairs, however, senses must be split to a finer grain, because the target language has a different sense structure. What should be kept and in what form also depends on the directionality of the dictionary. Lexicographers try to use the available space to cram in as much information as possible, insofar as this is compatible with usability.

Other Issues of Bilingual Lexicography

Typography Design and typography are extremely important for dictionaries and even more so for bilingual dictionaries because the risk of confusion between the source language and the target language is high, particularly when the two languages have similarities. Bilingual dictionaries also contain a great deal of metalanguage that must be clearly distinguished from the text so that inexperienced users do not confuse metalanguage and translation. In the case of bidirectional dictionaries, the design must also take into account the conventions of both cultures the dictionary is designed for. Sometimes a compromise between conflicting traditions must be found. The objective of good dictionary design is always to enhance accessibility and readability.

In paper dictionaries, improvements in typography in recent years have improved the clarity of the text in many ways. As for electronic dictionaries (handheld, online, and CD-ROMs), much is still to be done. The technology of electronic presentation is primitive compared with that of the printed dictionary page. Handheld dictionaries have a minuscule screen, usually no color, and very few fonts. Larger electronic dictionaries are still very much influenced by paper products (in particular, paper products with a much simpler structure than dictionaries), so they do not make full use of the computer screen's potential. Either the dictionary information is grossly oversimplified – for example with few or no discriminators – or the entries are too large to fit on a screen, so that users may get lost within entries or forget to look at many more senses not immediately visible, i.e., 'down the page.' These problems will no doubt eventually be solved by computer typographical designers. They will find ways of making the information more accessible, for example by using hypertext menus to show the size and shape of an article.

Symmetry in Bilingual Dictionaries: Nonreversibility The issue of symmetry and reversibility has been explored. Every publisher's dream of producing a cheap bilingual dictionary by reversing language A > language B is in fact unworkable, except for very simple technical glossaries in restricted domains. Why? Because a bilingual dictionary is the description of a source language (language A) using only some of the resources of the target language (language B). A compilation of those resources used for the target language does not itself constitute a framework for language B as a source language. There is no reason to believe that all the expressions of language B that need translation will be present in the terms used to translate language A. Another temptation is to use two dictionaries with the same source language A > B and A > C to create a B > C or C > B dictionaries. Again, this tends to result in an inadequate (and distorted) word list.

The Limitations of Bilingual Lexicography The limitations of bilingual dictionaries are quickly reached for such items as jokes, puns, and palindromes. Translators working within the context of a novel or a

story will work hard to find solutions, but a general bilingual dictionary cannot begin to deal with these things. Another area where bilingual dictionaries cannot provide all the help that is necessary or desirable for translators or foreign readers lies in cultural differences and connotations. A translation may be completely correct at the word level, but the background will remain unexplained. Worse still, there will be no usable equivalent terms, because of cultural differences. In order to compensate for these gaps, some bilingual dictionary publishers now add little cultural notes to supply extra-linguistic information. This stilll leaves translators to their own devices to find a suitable solution.

Bilingual Dictionaries Today and Tomorrow

The world of dictionaries is evolving at great speed with free online dictionaries, scientific project dictionaries, and all sorts of other independent enterprises, as well as commercial projects. Commercial dictionaries are classified either by the media in which they are presented (paper, CD-ROM, online, or handheld devices) or, more traditionally, according to their size or their macrostructure (or arrangement of headwords). They can also be distinguished by the way information is presented: alphabetically or thematically. The main subdivisions of alphabetical dictionaries are: general dictionaries, specialized (or LSP) dictionaries, and learners' dictionaries. The name 'general dictionaries' is self-explanatory; these dictionaries vary in size, according to the audience they are aimed at: travelers, businesspeople, translators, etc. Specialized or LSP dictionaries are aimed at users who are working within a subject field and only need access to a restricted, yet relevant, set of words or terms. These are sometimes called technical dictionaries (*see* **Terminology and Terminological Databases**). Learners' dictionaries are the subject of a separate article (*see* **Learners' Dictionaries**). A fourth kind of alphabetical dictionary – halfway between a monolingual and a bilingual dictionary – is called semi-bilingual by its publishers or bilingualized by the academic world. It combines the definitions of a monolingual learners' dictionary, adapted to the learner's level of competence, with the sort of headword translation equivalents supplied in a bilingual dictionary, thus helping the user understand the definition. However, it is not a translation dictionary in the traditional sense of the term. The translation complements the information about the source language; it is not usually given as a piece of directly usable information.

In the European tradition, thematic bilingual dictionaries are uncommon; they are usually designed for learners and are useful for learning words about a subject. Two types are worth mentioning. The first one is the series called Word Routes, published by Cambridge University Press, and several language pairs such as English–French, English–Greek, English–Italian, etc., are available. All the explanations are supplied in the language of the foreign (non-English) speaker. The foreign language to English section is very restricted; it is an index at the end of the book that references those pages where the word is used as a translation of an English headword.

The second category of thematic bilingual dictionaries is pictorial or visual. In these dictionaries, illustrations replacing headwords are grouped by theme and numbered. Numbers give access to words in two languages on the same page as the picture. At the end of the book, an index in each language crossreferences the page and item number of the pictures, the translation of each word, and the subject's vocabulary. Oxford University Press has published the original *Duden pictorial dictionary* in a variety of languages including the *Oxford Arabic-Duden pictorial English dictionary with Arabic index*, the *Oxford-Duden Thai and English dictionary*, and two other pictorial dictionaries – the English and Chinese and the Portuguese and English.

Currently available bilingual electronic dictionaries, whether on CD-ROM or handheld, tend to be based on the electronic files of an existing paper dictionary, usually alphabetical, with a few added functionalities for searches. These functionalities may include subject-based searches, making the dictionaries more versatile and giving them a thematic flavor.

Handheld dictionaries, which usually have a small screen showing only a few lines of text, are difficult to use for more complex entries. Electronic dictionaries on CD-ROM have a few more functionalities (notably full-text search and hypertext navigation), but at this time few, if any, have been designed only in electronic format. It is impossible to name all the projects currently being developed: commercial ones for obvious reasons of confidentiality, others simply because of their numbers. Searches on the Web give many site addresses of projects, some bilingual, some multilingual, which involve contributors all over the world. Their reliability varies and so does their user-friendliness. New projects are being devised such as a Dutch > English dictionary "conceived as an electronic device that will contain one central database including all relevant information for receptive and

productive use of the L2" (Bogaards and Hannay, 2004).

Finally, another direction of bilingual lexicography should be mentioned, namely dictionary projects for endangered languages, in particular the work and electronic tools of organizations such as SIL (the Summer Institute of Linguistics), "a faith-based organization that studies, documents, and assists in developing the world's lesser-known languages," and SULTRY (Sydney University Language Technology Research Laboratory), which focuses on Australian Aboriginal languages.

So long as dictionaries are published as books, their evolutionary scope is very limited. As dictionaries, particularly bilingual ones, move into the electronic era, however, their shape and contents will evolve until they are so different from those today that they may no longer even be called dictionaries. They will be called translation aids, translation tools, lexical databases ... and many other things, some difficult to imagine today as we stand on the threshold of these developments.

Bilingualism

What Is Bilingualism?

Bilingualism is a product of extensive language contact (i.e., contacts between people who speak different languages). There are many reasons for speakers of different languages to get into contact with one another. Some do so out of their own choosing, whereas others are forced by circumstances. Among the frequently cited factors that contribute to language contact are education, modern technology, economy, religion and culture, political or military acts, and natural disasters. One does not have to move to a different place to be in contact with people speaking a different language. There are plenty of opportunities for language contact in the same country, the same community, the same neighborhood, or even the same family.

However, although language contact is a necessary condition for bilingualism at the societal level, it does not automatically lead to bilingualism at the individual level. For example, Belgium, Canada, Finland, India, Luxembourg, Paraguay, and Singapore, to name but a few countries, are bi- or multilingual, but the degree or extent of bilingualism among the residents of these countries varies significantly. There are large numbers of bilingual or multilingual individuals in Luxembourg, Paraguay, and Singapore, but considerably fewer in the other officially bi- or multilingual countries. Mackey (1962) claims that there are actually fewer bilingual people in bilingual countries than there are in the so-called 'unilingual' ones, because the main concerns of bi- or multilingual states are often the maintenance and use of two or more languages in the same nation, rather than the promotion of bilingualism among their citizens. It is therefore important to distinguish bilingualism as a social or societal phenomenon from bilingualism as an individual phenomenon.

Who Is Bilingual?

People who are brought up in a society in which monolingualism and uniculturalism are promoted as the normal way of life often think that bilingualism is only for a few, 'special' people. In fact, one in three of the world's population routinely uses two or more languages for work, family life, and leisure. There are even more people who make irregular use of languages other than their native one; for example, many people have learned foreign languages at school and only occasionally use them for specific purposes. If we count these people as bilinguals, then monolingual speakers would be a tiny minority in the world today.

Yet the question of who is and who is not a bilingual is more difficult to answer than it first appears. Baker and Prys Jones (1998: 2) suggest that in defining a bilingual person, we may wish to consider the following questions:

- Should bilingualism be measured by how fluent people are in two languages?
- Should bilinguals be only those people who have equal competence in both languages?
- Is language proficiency the only criterion for assessing bilingualism, or should the use of two languages also be considered?
- Most people would define a bilingual as a person who can speak two languages. What about a person who can understand a second language perfectly but cannot speak it? What about a person who can speak a language but is not literate in it? What about an individual who cannot speak or understand speech in a second language but can read and write it? Should these categories of people be considered bilingual?
- Should self-perception and self-categorization be considered in defining who is bilingual?
- Are there different degrees of bilingualism that can vary over time and with circumstances? For instance, a person may learn a minority language as a child at home and then later acquire another, majority language in the community or at school. Over time, the second language may become the stronger or dominant language. If that person moves away from the neighborhood or area in which the minority language is spoken or loses contact with those who speak it, he or she may lose fluency in the minority language. Should bilingualism therefore be a relative term?

The word 'bilingual' primarily describes someone with the possession of two languages. It can, however, also be taken to include the many people in the world who have varying degrees of proficiency in and interchangeably use three, four or even more languages. In many countries of Africa and Asia, several languages coexist and large sections of the population speak three or more languages. Individual multilingualism in these countries is a fact of life. Many people speak one or more local or ethnic languages, as well as another indigenous language which has become the medium of communication between different ethnic

groups or speech communities. Such individuals may also speak a foreign language – such as English, French or Spanish – which has been introduced into the community during the process of colonization. This latter language is often the language of education, bureaucracy and privilege.

Multilingualism can also be the possession of individuals who do not live within a multilingual country or speech community. Families can be trilingual when the husband and wife each speak a different language as well as the common language of the place of residence. People with sufficient social and educational advantages can learn a second, third, or fourth language at school or university; at work; or in their leisure time. In many continental European countries, children learn two languages at school – such as English, German, or French – as well as being fluent in their home language – such as Danish, Dutch, or Luxembourgish.

It is important to recognize that a multilingual speaker uses different languages for different purposes and does not typically possess the same level or type of proficiency in each language. In Morocco, for instance, a native speaker of Berber may also be fluent in colloquial Moroccan Arabic but not literate in either of these languages. This Berber speaker will be educated in Modern Standard Arabic and use that language for writing and formal purposes. Classical Arabic is the language of the mosque, used for prayers and reading the Qur'an. Many Moroccans also have some knowledge of French, the former colonial language.

Theoretical Issues in Bilingualism Research

Chomsky (1986) defined three basic questions for modern linguistics:

i. What constitutes knowledge of language?
ii. How is knowledge of language acquired?
iii. How is knowledge of language put to use?

For bilingualism research, these questions can be rephrased to take in knowledge of more than one language (see also Cook, 1993):

i. What is the nature of language, or grammar, in the bilingual person's mind, and how do two systems of language knowledge coexist and interact?
ii. How is more than one grammatical system acquired, either simultaneously or sequentially? In what aspects does bilingual language acquisition differ from unilingual language acquisition?
iii. How is the knowledge of two or more languages used by the same speaker in bilingual speech production?

Taking the acquisition question first, earlier observers of bilingual children concentrated on documenting the stages of their language development. Volterra and Taeschner (1978), for example, proposed a three-stage model of early bilingual development. According to this model, the child initially possesses one lexical system composed of lexical items from both languages. In stage two, the child distinguishes two separate lexical codes but has one syntactic system at his or her disposal. Only when stage three is reached do the two linguistic codes become entirely separate. Volterra and Taeschner's model gave rise to what is now known as the 'unitary language system hypothesis.' In its strongest version, the hypothesis supposes that the bilingual child has one single language system that they use for processing both of their languages in the repertoire.

In the 1980s, the unitary language system hypothesis came under intense scrutiny; for instance, by Meisel (1989) and Genesee (1989). They argue that there is no conclusive evidence to support the existence of an initial undifferentiated language system, and they also point out certain methodological inconsistencies in the three-stage model. The phenomenon of language mixing, for instance, can be interpreted as a sign of two developing systems existing side by side, rather than as evidence of one fused system. Meisel's and Genesee's studies led to an alternative hypothesis, known as the 'separate development hypothesis' or 'independent development hypothesis.' More recently, researchers have investigated the possibility that different aspects of language (e.g., phonology, vocabulary, syntax, pragmatics) of the bilingual child's language systems may develop at different rates (e.g., Li and Zhu, 2001). Care needs to be taken in interpreting research evidence using children at different developmental stages.

Although the 'one-versus-two-systems' debate (i.e., whether bilingual children have an initially differentiated or undifferentiated linguistic system) continues to attract new empirical studies, a more interesting question has emerged regarding the nature of bilingual development. More specifically, is bilingual acquisition the same as monolingual acquisition? Theoretically, separate development is possible without there being any similarity with monolingual acquisition. Most researchers argue that bilingual children's language development is, by and large, the same as that of monolingual children. In very general terms, both bilingual and monolingual children go through an initial babbling stage, followed by the

one-word stage, the two-word stage, the multiword stage, and the multiclause stage. At the morphosyntactic level, a number of studies have reported similarities rather than differences between bilingual and monolingual acquisition. Garcia (1983), for example, compared the use of English morpheme categories by English monolingual children and bilingual children acquiring English and Spanish simultaneously and found no systematic difference at all. Pfaff and Savas (1988) found that their 4-year-old Turkish/German subject made the same errors in Turkish case marking as reported in the literature on monolingual Turkish children. Muller's (1990) study of two French/German children indicates that their use of subject–verb agreement and finite verb placement in both languages is virtually identical to that of comparable monolingual children. De Houwer (1990) found that her Dutch/English bilingual subject, Kate, used exactly the same word orders in Dutch as monolingual Dutch-speaking children, both in terms of types and in proportional use. Furthermore, De Houwer found in Kate parallels to monolingual children for both Dutch and English in a range of structures, such as nonfinite verb placement, preposed elements in affirmative sentences, clause types, sentence types, conjunctions, and question inversion.

Nevertheless, one needs to be careful in the kinds of conclusions one draws from such evidence. Similarities between bilingual and monolingual acquisition do not mean that the two languages a bilingual child is acquiring develops in the same way or at the same speed, or that the two languages a bilingual child is acquiring do not influence and interact with each other. Paradis and Genesee (1996), for example, found that although the 2–3-year-old French–English bilingual children they studied displayed patterns that characterize the performance of monolingual children acquiring these languages separately, and they acquired these patterns within the same age range as monolingual children, they used finite verb forms earlier in French than in English; used subject pronouns in French exclusively with finite verbs, but subject pronouns in English with both finite and nonfinite verbs, in accordance with the status of subject pronouns in French as clitics (or agreement markers) but full NPs in English; and placed verbal negatives after lexical verbs in French (e.g., 'n'aime pas') but before lexical verbs in English ('do not like'). Further evidence of cross-linguistic influence has been reported by Dopke (1992), for example, in her study of German–English bilingual children in Australia. These children tended to overgeneralize the –VO word order of English to German, which instantiates both VO and OV word orders, depending on the clausal structure of the utterance. Dopke suggests that children learning English and German simultaneously are prone to overgeneralize SVO word order in their German because the VO order is reinforced on the surface of both the German and the English input they hear.

Most of the studies that have examined cross-linguistic influences in bilingual acquisition focus on morphosyntactic features. One area that has hitherto been underexplored is the interface between phonetics and phonology in bilingual acquisition. Although most people seem to believe that the onset of speech by bilingual children is more or less the same as for monolingual children, there are indications that bilingual children seem to develop differently from monolingual children in the following three aspects: the overall rate of occurrence of developmental speech errors, the types of speech errors and the quality of sounds (Zhu and Dodd, 2005). For example, studies on Cantonese/English (Holm and Dodd), Putonghua/Cantonese (So and Leung), Welsh/English (Ball *et al.*), Spanish/English (Yavas and Goldstein), and Punjabi/English (Stow and Pert) (also in Zhu and Dodd, 2006) bilingual children seem to indicate that bilingual children tend to make not only more speech errors but also different types of speech errors compared with monolingual children of the same age. These speech errors would be considered atypical if they had occurred in the speech of monolingual children. Moreover, although bilingual children seem to be able to acquire monolingual-like competence at the phonemic level, there are qualitative differences at the phonetic level in terms of production. For example, using instrumental analysis, Khattab (also in Zhu and Dodd, 2006) finds that although Arabic–English bilingual children have similar patterns of production and use of VOT, /l/, and /r/ in some respects to those of monolinguals from each language, they also show differences that are intricately related to age, input, and language context. These studies and others are reported in Zhu and Dodd (2005).

There is one area in which bilingual children clearly differ from monolingual children; namely, code-mixing. Studies show that bilingual children mix elements from both languages in the same utterance as soon as they can produce two-word utterances. Researchers generally agree that bilingual children's mixing is highly structured and grammatically constrained, although there is no consensus on the nature of the specific constraints that organize their mixing. Vihman (1985), who studied her own son Raivo, who acquired English and Estonian simultaneously, argued, for example, that the language mixing by bilingual children is qualitatively different from that of more mature bilinguals. She invoked as evidence for this claim the fact that young bilingual children

indicate a propensity to mix function words over contentives (e.g., nouns, verbs, adjectives) – a type of mixing that is rare in older bilingual mixing. However, Lanza's (1997) study, although finding similar patterns in the mixing produced by her two Norwegian–English bilingual subjects, argued that children's mixing is qualitatively the same as that of adults; their relatively greater degree of mixing of function words is evidence of what Lanza called 'dominance' of one language over another rather than of a substantial difference from bilingual adults' mixing. Both Vihman and Lanza, as well as other studies of children's mixing, show that bilingual children mix their languages in accordance with constraints that operate on adult mixing. The operation of constraints based on surface features of grammar, such as word order, is evident from the two-word/two-morpheme stage onward, and the operation of constraints based on abstract notions of grammatical knowledge is most evident in bilingual children once they demonstrate such knowledge overtly (e.g., verb tense and agreement markings), usually around two years and 6 months of age and older. As Genesee (2002) points out, these findings indicate that in addition to the linguistic competence needed to formulate correct monolingual strings, bilingual children have the added capacity to coordinate their two languages in accordance with the grammatical constraints of both languages during mixing. Although these studies provide further evidence for the separate development, or two-systems, argument, they also indicate that there are both quantitative and qualitative differences between bilingual acquisition and monolingual acquisition.

Another area of interest in acquisitional studies of bilingual children is the role of input and social context in the rate and order of language acquisition. Earlier assumptions were that the bilingual child would have half, or less, of the normal input in each of their two languages, compared with the monolingual child. More careful examinations of bilingual children show considerable variations in the quantity and quality of input, interactional styles of the parents, and environmental policies and attitudes toward bilingualism. On the basis of Harding and Riley's work (1986), Romaine (1995) distinguished six types of early-childhood bilingualism according to the native language of the parents, the language of the community at large, and the parents' strategy in speaking to the child.

Type 1: One person, one language.

- Parents: The parents have different native languages, with each having some degree of competence in the other's language.
- Community: The language of one of the parents is the dominant language of the community.
- Strategy: The parents each speak their own language to the child from birth.

Type 2: Nondominant Home Language/One Language, One Environment

- Parents: The parents have different native languages.
- Community: The language of one of the parents is the dominant language of the community.
- Strategy: Both parents speak the nondominant language to the child, who is fully exposed to the dominant language only when outside the home, and in particular in nursery school.

Type 3: Nondominant Home Language without Community Support

- Parents: The parents share the same native languages.
- Community: The dominant language is not that of the parents.
- Strategy: The parents speak their own language to the child.

Type 4: Double Nondominant Home Language without Community Support

- Parents: The parents have different native languages.
- Community: The dominant language is different from either of the parents.
- Strategy: The parents each speak their own language to the child from birth.

Type 5: Nonnative Parents

- Parents: The parents share the same native language.
- Community: The dominant language is the same as that of the parents.
- Strategy: One of the parents always addresses the child in a language that is not his or her native language.

Type 6: Mixed Languages

- Parents: The parents are bilingual.
- Community: Sectors of community may also be bilingual.
- Strategy: Parents code-switch and mix languages.

The three headings Romaine used to classify the six types of childhood bilingualism – the languages of the parents, the sociolinguistic situation of the community, and the discourse strategies of the parents and other immediate carers – are critical factors not only in the process of bilingual acquisition but also in

Figure 1 Lexical association model.

Figure 2 Dual-store model.

the final product of that process (i.e., the type of bilingual speaker it produces). Arguably, the six types of bilingual children would grow up as different types of bilinguals with different mental representations of the languages and different patterns of language behavior.

Research on the cognitive organization and representation of bilingual knowledge is inspired and influenced by the work of Weinreich. Focussing on the relationship between the linguistic sign (or signifier) and the semantic content (signified), Weinreich (1953) distinguished three types of bilinguals. In type A, the individual combines a signifier from each language with a separate unit of the signified. Weinreich called them 'coordinative' (later often called 'coordinate') bilinguals. In type B, the individual identifies two signifiers but regards them as a single compound, or composite, unit of signified; hence 'compound' bilinguals. Type C refers to people who learn a new language with the help of a previously acquired one. They are called 'subordinative' (or 'subordinate') bilinguals. Weinreich's examples were from English and Russian:

```
(A) 'book'    'kniga'
      |          |
    /buk/     /kn'iga/

(B)   'book' = 'kn'iga'

        /\
     /buk/   /kn'iga/

(C) 'book'
      |
    /buk/
      |
    /kn'iga/
```

Weinreich's distinctions are often misinterpreted in the literature as referring to differences in the degree of proficiency in the languages, but in fact the relationship between language proficiency and cognitive organization of the bilingual individual, as conceptualized in Weinreich's model, is far from clear. Some 'subordinate' bilinguals demonstrate a very high level of proficiency in processing both languages, as evidenced in grammaticality and fluency of speech, and some 'coordinative' bilinguals show difficulties in processing two languages simultaneously (i.e., in code-switching or in 'foreign' word identification tasks). It must also be stressed that Weinreich's distinctions among bilingual individuals are distributed along a continuum from a subordinate or compound end to a coordinate end and can at the same time be more subordinate or compound for certain concepts and more coordinate for others, depending on, among other things, the age and context of acquisition.

Weinreich's work influenced much of the psycholinguistic modelling of the bilingual lexicon. Potter *et al.* (1984) presented a reformulation of the manner in which bilingual lexical knowledge could be represented in the mind in terms of two competing models: the Concept Mediation Model and the Word Association model. In the Concept Mediation Model, words of both L1 and L2 are linked to amodal conceptual representations. In the Lexical Association Model, in contrast, words in a second language are understood through L1 lexical representations. As can be seen in Figure 1, the models are structurally equivalent to Weinreich's distinction between coordinative and subordinative bilingualism. At the same time, several researchers (e.g., Kolers and Gonzalez [1980] and Hummel [1986]) presented evidence for the so-called dual-store model, as represented in Figure 2. This latter model has also generated considerable research on the existence of the putative 'bilingual language switch' postulated to account for the bilingual's ability to switch between languages on the basis of environmental demands (e.g., MacNamara, 1967; MacNamara and Kushnir, 1971).

Subsequent studies found conflicting evidence in favor of different models. Some of the conflicting evidence could be explained by the fact that different types of bilingual speakers were used in the experiments in terms of proficiency level, age, and context of acquisition. It is possible that lexical mediation is associated with low levels of proficiency, and concept mediation with higher levels, especially for those who have become bilingual in later childhood or adulthood. Some researchers called for a developmental dimension in the modelling of bilingual knowledge.

Figure 3 Revised hierarchical model.

Figure 4 Adapted from Grosjean, 1982: 129.

Kroll and Stewart (1994), for example, proposed the Revised Hierarchical Model, which represents concept mediation and word association not as different models but as alternative routes within the same model (see Figure 3).

An important distinctive feature of being bilingual is being able to make appropriate language choices. Bilingual speakers choose to use their different languages depending on a variety of factors, including the type of person addressed (e.g., members of the family, schoolmates, colleagues, superiors, friends, shopkeepers, officials, transport personnel, neighbors), the subject matter of the conversation (e.g., family concerns, schoolwork, politics, entertainment), location or social setting (e.g., at home, in the street, in church, in the office, having lunch, attending a lecture, negotiating business deals), and relationship with the addressee (e.g., kin, neighbors, colleagues, superior/inferior, strangers). However, even more complex are the many cases in which a bilingual talks to another bilingual with the same linguistic background and changes from one language to another in the course of conversation. This is what is known as code-switching. Figure 4 illustrates a decision-making process of the bilingual speaker in language choice and code-switching.

There is a widespread impression that bilingual speakers code-switch because they cannot express themselves adequately in one language. This may be true to some extent when a bilingual is momentarily lost for words in one of his or her languages. However, code-switching is an extremely common practice among bilinguals and takes many forms. A long narrative may be divided into different parts expressed in different languages, sentences may begin in one language and finish in another, and words and phrases from different languages may succeed each other. Linguists have devoted much attention to the study of code-switching. It has been demonstrated that code-switching involves skilled manipulation of overlapping sections of two or more grammars and that there is virtually no instance of ungrammatical combination of two languages in code-switching, regardless of the bilingual ability of the speaker. Some suggest that code-switching is itself a discrete mode of speaking, emanating from a single code-switching grammar.

One important aspect of the code-switching grammar is that the two languages involved do not play the same role in sentence making. Typically, one language sets the grammatical framework, with the other providing certain items to fit into the framework. Code-switching therefore is not a simple combination of two sets of grammatical rules but grammatical integration of one language in another. Bilingual speakers of different proficiency levels in their two languages or speaking two typologically different languages can engage in code-switching and, indeed, vary it according to their needs. The possible existence of a code-switching grammar calls into question the traditional view of the bilingual as two monolinguals in one person (for further discussions, see Grosjean, 1985). One consequence of the 'two-in-one' perspective is that bilingual speakers are often compared to monolinguals in terms of their language proficiency.

For example, some researchers have suggested that bilingual children have smaller vocabularies and less-developed grammars than their monolingual peers, while their ability to exploit the similarities and differences in two sets of grammatical rules to accomplish rule-governed code-switching was not considered relevant. In some experimental psycholinguistic studies, tests are given without taking into account that bilingual speakers may have learned their two languages under different conditions for different purposes and that they only use them in different situations with different people. It is important to emphasize that bilingual speakers have a unique linguistic and psychological profile; their two languages are constantly in different states of activation, and they are able to call on their linguistic knowledge and resources according to the context and adapt their behavior to the task at hand.

Bilingualism as a Sociopolitical Issue

Language choice is not a purely linguistic issue. In many countries of the world, much of the social identification of individuals, as well as of groups, is accomplished through language choice. By choosing one or another of the two or more languages in one's linguistic repertoire, a speaker reveals and defines his or her social relationships with other people. At a societal level, whole groups of people, and in fact, entire nations, can be identified by the language or languages they use. Language, together with culture, religion, and history, is a major component of national identity.

Multilingual countries are often thought to have certain problems that monolingual states do not. On the practical level, difficulties in communication within a country can act as an impediment to commerce and industry. More seriously, however, multilingualism is a problem for government. The process of governing requires communication both within the governing institutions and between the government and the people. This means that a language, or languages, must be selected as the language for use in governing. However, the selection of the 'official language' is not always easy, as it is not simply a pragmatic issue. For example, on pragmatic grounds, the best immediate choice for the language of government in a newly independent colony might be the old colonial language, as the colonial governing institutions and records are already in place in that language, and those nationals with the most government experience already know it. The old colonial language will not, however, be a good choice on nationalist grounds. For a people that has just acquired its own geographical territory, the language of the state that had denied it territorial control would not be a desirable candidate for a national symbol. Ireland has adopted a strategy in which both the national language, Irish, and the language of the deposed power, English, are declared as official; the colonial language is used for immediate, practical purposes, and the national language is promoted and developed. However, in many other multilingual countries that do not have a colonial past, such as China, deciding which language should be selected as the national language can sometimes lead to internal, ethnic conflicts.

Similarly, selecting a language for education in a multilingual country is often problematic. In some respects, the best strategy for language in education is to use the various ethnic languages. After all, these are the languages the children already speak, and school instruction can begin immediately without waiting until the children learn the official language. Some would argue, however, that this strategy could be damaging for nation-building efforts and disadvantage children by limiting their access to the wider world. It should be pointed out that there is no scientific evidence to show that multilingual countries are particularly disadvantaged, in socioeconomic terms, compared to monolingual ones. In fact, all the research that was carried out in the 1960s and 1970s on the relationship between the linguistic diversity and economic well-being of a nation came to the conclusion that a country can have any degree of language uniformity or fragmentation and still be underdeveloped, and a country whose entire population speaks the same language can be anywhere from very rich to very poor. It might be true, however, that linguistic uniformity and economic development reinforce each other; in other words, economic well-being promotes the reduction of linguistic diversity. It would be lopsided logic, though, to view multilingualism as the cause of the socioeconomic problems of a nation.

Multilingualism is an important resource at both the societal and personal levels. For a linguistically diverse country to maintain ethnic group languages alongside the national or official languages can prove an effective way to motivate individuals while unifying the nation. In addition, a multiethnic society is arguably a richer, more exciting, and more stimulating place to live in than a community with only one dominant ethnic group. For the multilingual speaker, the availability of various languages in the community repertoire serves as a useful interactional resource. Typically, multilingual societies tend to assign different roles to different languages; one language may be used in informal contexts with family and friends, while another for the more formal situations of work, education, and government. Imagine two friends who are both bilingual in the same 'home' and 'official' languages. Suppose that one of them also works for the local government and that her friend has some official business with her. Suppose further that the government employee has two pieces of advice to give to her friend: one based on her official status as a government representative, and one based on their mutual friendship. If the official advice is given in the 'government' language and the friendly advice in the 'home' language, there is little chance that there would be any misunderstanding about which advice was which. The friend would not take the advice given in the 'home' language as official.

There is a frequent debate in countries in which various languages coexist concerning which languages are a resource. The favored languages tend to be those that are both international and particularly valuable in international trade. A lower place is

given in the status ranking to minority languages, which are small, regional, and of less perceived value in the international marketplace. For example, French has traditionally been the number one modern language in the British school curriculum, followed by German and Spanish, and then a choice between Italian, Modern Greek, and Portuguese. One may notice that all of these are European languages. Despite large numbers of mother-tongue Bengali, Cantonese, Gujarati, Hakka, Hindi, Punjabi, Turkish, and Urdu speakers in England, these languages occupy a very low position in the school curriculum. In the British National Curriculum, the languages Arabic, Bengali, Chinese (Cantonese or Mandarin), Gujarati, Modern Hebrew, Hindi, Japanese, Punjabi, Russian, Turkish, and Urdu are initially only allowed in secondary schools (for 11–18 year olds) if a major European language such as French is taught first (Milroy and Milroy, 1985).

Clearly, multilingualism as a national and personal resource requires careful planning, as would any other kind of resource. However, language planning has something that other kinds of economic planning do not usually have: language as its own unique cultural symbolic value. As has been discussed earlier, language is a major component of the identity of a nation and an individual. Often, strong emotions are evoked when talking about a certain language. Language planning is not simply a matter of standardizing or modernizing a corpus of linguistic materials, nor is it a reassignment of functions and status. It is also about power and influence. The dominance of some languages and the dominated status of other languages are partly understandable if we examine who holds positions of power and influence, who belong to elite groups that are in control of decision-making, and who are in subordinate groups, on whom decisions are implemented. It is more often than not the case that a given arrangement of languages benefits only those who have influence and privileges.

For the multilingual speaker, language choice is not only an effective means of communication but also an act of identity (Le Page and Tabouret-Keller, 1985). Every time we say something in one language when we might just as easily have said it in another, we are reconnecting with people, situations, and power configurations from our history of past interactions and imprinting on that history our attitudes toward the people and languages concerned. Through language choice, we maintain and change ethnic group boundaries and personal relationships and construct and define 'self' and 'other' within a broader political economy and historical context.

Changes in Attitudes Toward Bilingualism

From the early nineteenth century to about the 1960s, there was a widespread belief that bilingualism has a detrimental effect on a human beings' intellectual and spiritual growth. Stories of children who persisted in speaking two languages in school having had their mouths washed with soap and water or being beaten with a cane were not uncommon. The following is a quote from a professor at Cambridge University that illustrates the dominant belief of the time, even among academics and intellectuals:

> If it were possible for a child to live in two languages at once equally well, so much the worse. His intellectual and spiritual growth would not thereby be doubled, but halved. Unity of mind and character would have great difficulty in asserting itself in such circumstances. (Laurie, 1890: 15)

Professor Laurie's view represented a commonly held belief throughout the twentieth century that bilingualism disadvantages rather than advantages one's intellectual development. Early research on bilingualism and cognition tended to confirm this negative viewpoint, finding that monolinguals were superior to bilinguals on intelligence tests. One of the most widely cited studies was done by Saer (1923) who studied 1400 Welsh–English bilingual children between the ages of 7 and 14 years in five rural and two urban areas of Wales. A 10-point difference in IQ was found between the bilinguals and the monolingual English speakers from rural backgrounds. From this, Saer concluded that bilinguals were mentally confused and at a disadvantage in intelligence compared with monolinguals. It was further suggested, with a follow-up study of university students, that "the difference in mental ability as revealed by intelligence tests is of a permanent nature since it persists in students throughout their university career" (Saer, 1923: 53).

Controversies regarding the early versions of IQ tests and the definition and measurement of intelligence aside, there were a number of problems with Saer's study and its conclusions. First, it appeared to be only in the rural areas that the correlation between bilingualism and lower IQ held. In urban areas, monolinguals and bilinguals were virtually the same; in fact, the average IQ for urban Welsh–English bilingual children in Saer's study was 100, whereas for monolingual, English-speaking children it was 99. The urban bilingual children had more contact with English both before beginning school and outside school hours than did the rural bilinguals. Thus, the depressed scores of the rural population were probably more a reflection of lack of opportunity

and contexts to use English and were not necessarily indicative of any sociopsychological problems.

More important, however, is the issue of statistical inference in this and other studies of a similar type. Correlations do not allow us to infer cause-and-effect relationships, particularly when other variables – such as rural versus urban differences – may be mediating factors. Another major factor is the language in which such tests were administered, particularly tests of verbal intelligence. Many such studies measured bilinguals only in the second or nondominant language.

At around the same time that Saer conducted studies on bilinguals' intelligence, some well-known linguists expressed their doubts about bilingual speakers' linguistic competence. The following is Bloomfield's characterization of a Menomini Indian man in the United States, whom he believed to have 'deficient' knowledge of Menomini and English:

> White Thunder, a man around 40, speaks less English than Menomini, and that is a strong indictment, for his Menomini is atrocious. His vocabulary is small, his inflections are often barbarous, he constructs sentences of a few threadbare models. He may be said to speak no language tolerably. (Bloomfield, 1927: 395)

This is one of the early statements of a view that became fashionable in educational circles; namely, that it was possible for bilinguals not to acquire full competence in any of the languages they spoke. Such an individual was said to be 'semilingual.' These people were believed to have linguistic deficits in six areas of language (see Hansegard, 1975; Skutnabb-Kangas, 1981):

1. Size of vocabulary
2. Correctness of language
3. Unconscious processing of language
4. Language creation
5. Mastery of the functions of language
6. Meanings and imagery.

It is significant that the term 'semilingualism' emerged in connection with the study of language skills of people belonging to ethnic minority groups. Research that provided evidence in support of the notion of 'semilingualism' was conducted in Scandinavia and North America and was concerned with accounting for the educational outcomes of submersion programs in which minority children were taught through the medium of the majority language. However, these studies, similar to the ones conducted by Saer, had serious methodological flaws, and the conclusions reached by the researchers were misguided.

First, the educational tests used to measure language proficiencies and to differentiate between people were insensitive to the qualitative aspects of languages and to the great range of language competences. Language may be specific to a context; a person may be competent in some contexts but not in others. Second, bilingual children are still in the process of developing their languages. It is unfair to compare them to some idealized adults. Their language skills change over time. Third, the comparison with monolinguals is also unfair. It is important to distinguish whether bilinguals are 'naturally' qualitatively and quantitatively different from monolinguals in their use of the two languages (i.e., as a function of being bilingual). Fourth, if languages are relatively underdeveloped, the origins may not be in bilingualism per se but in the economic, political, and social conditions that evoke underdevelopment.

The disparaging and belittling overtone of the term 'semilingualism' itself invokes expectations of underachievement in the bilingual speaker. Thus, rather than highlighting the apparent 'deficits' of bilingual speakers, the more positive approach is to emphasize that when suitable conditions are provided, languages are easily capable of development beyond the 'semi' state.

One of the specific issues Bloomfield raised in his comments on the language behavior of members of the Menomini Indians in North America was the frequent mixing of their own language and English. It has been described as 'verbal salad,' not particularly appealing but nevertheless harmless, or 'garbage' that is definitively worthless and vulgar. Unfortunately, although switching and mixing of languages occurs in practically all bilingual communities and all bilingual speakers' speech, it is stigmatized as an illegitimate mode of communication, even sometimes by the bilingual speakers themselves. Haugen (1977: 97), for example, reports that a visitor from Norway made the following comment on the speech of the Norwegians in the United States: "Strictly speaking, it is no language whatever, but a gruesome mixture of Norwegian and English, and often one does not know whether to take it humorously or seriously." Gumperz (1982: 62–63) reports that some bilingual speakers who mixed languages regularly still believe such behavior was "bad manners" or a sign of "lack of education or improper control of language." One of the Punjabi–English bilinguals Romaine interviewed said: "I'm guilty as well in the sense that we speak English more and more and then what happens is that when you speak your own language you get two or three English words in each sentence . . . but I think that's 'wrong'" (Romaine, 1995: 294).

Attitudes do not, of course, remain constant over time. At a personal level, changes in attitudes may occur when there is some personal reward involved. Speakers of minority languages will be more motivated to maintain and use their languages if they prove to be useful in increasing their employability or social mobility. In some cases, certain jobs are reserved for bilingual speakers only. At the societal level, attitudes toward bilingualism change when the political ideology changes. In California and elsewhere in the southwestern United States, for instance, *pocho* and *calo* used to serve as pejorative terms for the Spanish of local Chicanos. With a rise in ethnic consciousness, however, these speech styles have become symbolic of Chicano ethnicity and are now increasingly used in contemporary Chicano literature. Since the 1960s, there has been a political movement, particularly in the United States, advocating language rights. In the United States, questions about language rights are widely discussed not only in college classrooms and language communities but also in government and federal legislatures.

Language rights have a history of being tested in U.S. courtrooms. From the early 1920s to the present, there has been a continuous debate in U.S. courts of law regarding the legal status of language minority rights. To gain short-term protection and a medium-term guarantee for minority languages, legal challenges have become an important part of the language rights movement. The legal battles concerned not just minority language vs. majority language contests, but also children vs. schools, parents vs. school boards, state vs. the federal authorities, and so on. Whereas minority language activists among the Basques in Spain and the Welsh in Britain have been taken to court by the central government for their actions, U.S. minority language activists have taken the central and regional government to court.

The language rights movement has received some support from organizations such as the United Nations, Unesco, the Council of Europe, and the European Union. Each of these four organizations has declared that minority language groups have the right to maintain their languages. In the European Union, a directive (77/486/E EC) stated that member states should promote the teaching of the mother tongue and the culture of the country of origin in the education of migrant workers' children. The kind of rights, apart from language rights, that minority groups may claim include protection, membership of their ethnic group and separate existence, nondiscrimination and equal treatment, education and information in their ethnic language, freedom to worship, freedom of belief freedom of movement, employment, peaceful assembly and association, political representation and involvement, and administrative autonomy.

However, real changes in attitudes toward bilingualism will not happen until people recognize or, better still, experience the advantages of being bilingual. Current research indicates that there are at least eight overlapping and interacting benefits for a bilingual person, encompassing communicative, cognitive and cultural advantages (adapted from Baker and Prys Jones, 1998: 6–8):

Communicative advantages

Relationships with parents: Where parents have differing first languages, the advantage of children becoming bilingual is that they will be able to communicate in each parent's preferred language. This may enable a subtler, finer texture of relationship with the parent. Alternatively they will be able to communicate with parents in one language and with their friends and within the community in a different language.

Extended family relationships: Being a bilingual allows someone to bridge the generations. When grandparents, uncles, aunts and other relatives in another region speak a language that is different from the local language, the monolingual may be unable to communicate with them. The bilingual has the chance to bridge that generation gap, build closer relationships with relatives extended family.

Community relationships: A bilingual has the chance to communicate with a wider variety of people than a monolingual. Bilingual children will be able to communicate in the wider community and with school and neighbourhood friends in different languages when necessary.

Transnational communication: One barrier between nations and ethnic groups tends to be language. Language is sometimes a barrier to communication and to creating friendly relationships of mutual respect. Bilinguals in the home, in the community and in society have the potential for lowering such barriers. Bilinguals can act as bridges within the nuclear and extended family, within the community and across societies.

Language sensitivity: Being able to move between two languages may lead to more sensitivity in Communication. Because bilinguals are constantly monitoring which language to use in different situations, they may be more attuned to the communicative needs of those with whom they talk. Research suggests that bilinguals may be more empathic towards listeners' needs in communication. When meeting those who do not speak their language particularly well, bilinguals may be more patient listeners than monolinguals.

Cultural advantages

Another advantage of being a bilingual is having two or more worlds of experience. Bilingualism provides the opportunity to experience two or more cultures. The monolingual may experience a variety of cultures; for example, from different neighbours and communities

that use the same language but have different ways of life. The monolingual can also travel to neighbouring countries and experience other cultures as a passive onlooker. However, to penetrate different cultures requires the language of that culture. To participate and become involved in the core of a culture requires a knowledge of the language of that culture.

There are also potential economic advantages to being bilingual. A person with two languages may have a wider portfolio of jobs available. As economic trade barriers fall, as international relationships become closer, as unions and partnerships across nations become more widespread, all increasing number of jobs are likely to require a person to be bilingual or multilingual. jobs in multinational companies, jobs selling and exporting, and employment prospects generated by translational contact make the future of employment more versatile for bilinguals than monolinguals.

Cognitive advantages

More recent research has shown that bilinguals may have some advantages in thinking, ranging from creative thinking to faster, progress in early cognitive development and greater sensitivity in communication. For example, bilinguals may have two or more words for cacti object and idea; sometimes corresponding words in different languages have different connotations. Bilinguals are able to extend the range of meanings, associations and images, and to think more flexibly and creatively. Therefore, a bilingual has the possibility of more awareness of language and more fluency, flexibility and elaboration in thinking than a monolingual.

It would be misleading to suggest that there is no disadvantage to bilingualism. Some problems, both social and individual, may be falsely attributed to bilingualism. For instance, when bilingual children exhibit language or personality problems, bilingualism is sometimes blamed. Problems of social unrest may unfairly be attributed to the presence of two or more languages in a community. However, the real possible disadvantages of bilingualism tend to be temporary. For example, bilingual families may be spending significantly more of their time and making much greater efforts to maintain two languages and bring up children bilingually. Some bilingual children may find it difficult to cope with the school curriculum in either language for a short period of time. However, the individual, cognitive, cultural, intellectual, and economic advantages bilingualism brings to a person make all the effort worthwhile.

A more complex problem associated with bilingualism is the question of identity of a bilingual. If a child has both a French and an English parent and speaks each language fluently, is he or she French, English, or Anglo-French? If a child speaks English and a minority language such as Welsh, is he or she Welsh, English, British, European, or what? It has to be said that for many bilingual people, identity is not a problem. Although speaking two languages, they are resolutely identified with one ethnic or cultural group. For example, many bilinguals in Wales see themselves as Welsh first, and possibly British next, but not English. Others, however, find identity a real, problematic issue. Some immigrants, for instance, desperately want to lose the identity of their native country and become assimilated and identified with the new home country, while some others want to develop a new identity and feel more comfortable with being culturally hyphenated, such as Chinese-American, Italian-Australian, Swedish-Finn, or Anglo-French. Yet identity crises and conflicts are never static. Identities change and evolve over time, with varying experiences, interactions, and collaborations within and outside a language group.

Bilingualism is not a static and unitary phenomenon; it is shaped in different ways, and it changes depending on a variety of historical, cultural, political, economic, environmental, linguistic, psychological, and other factors. Our understanding of bilingual speakers' knowledge and skills will grow as research methodology is defined and refined and our attitudes toward bilingualism change to the positive.

Bilingualism and Aphasia

P C M Wong, Northwestern University, Evanston, IL, USA

Bilingual individuals, sometimes referred to as multilinguals or polyglots, are broadly defined as individuals who know (and use) two or more languages. These individuals possibly acquire (or are still acquiring) the two or more languages at different times in their lives and use these languages at different levels of proficiency. Although the term 'perfect bilingual' has been used to refer to individuals who are equally proficient in the languages they know, often proficiency and use depend on the social/functional situations (e.g., work vs. family settings). Thus, it has been argued that bilinguals are not truly 'two monolinguals in one person' but are holistic, unique, and specific speaker–hearers (Grosjean, 1989). In the case of aphasia (language deficits as a result of brain damage), the various languages can be affected and recovered differently. Consequently, assessing and rehabilitating bilingual aphasics warrant considerations that are different from (or additional to) those associated with monolingual aphasics.

Bilingual individuals, sometimes referred to as multilinguals or polyglots, are broadly defined as individuals who know (and use) two or more languages. These individuals possibly acquire (or are still acquiring) the two or more languages at different times in their lives and use these languages at different levels of proficiency. Although the term 'perfect bilingual' has been used to refer to individuals who are equally proficient in the languages they know, often proficiency and use depend on the social/functional situations (e.g., work vs. family settings). Thus, it has been argued that bilinguals are not truly 'two monolinguals in one person' but are holistic, unique, and specific speaker–hearers (Grosjean, 1989). In the case of aphasia (language deficits as a result of brain damage), the various languages can be affected and recovered differently. Consequently, assessing and rehabilitating bilingual aphasics warrant considerations that are different from (or additional to) those associated with monolingual aphasics.

Bilingualism and the Brain

In order to better understand how neurological injuries may affect the linguistic abilities of individuals who speak more than one language, it is important to consider how multiple languages may be organized in the brain. Traditionally, the debate has been centered on 'language laterality' or 'hemispheric specialization'; that is, whether one side of the brain (the left side) is mostly responsible for both languages, whether the right hemisphere contributes in the case of bilinguals more so than in monolinguals, and whether one hemisphere contributes mostly to only one language (Paradis, 1990). Although the issue of laterality has some bearing on predicting the presence or absence of aphasia as a result of brain injury, it only considers the brain in very gross neuroanatomic terms (i.e., left and right hemispheres). Recently, the precise neuroanatomic circuits within and across cerebral hemispheres have been considered, as have other structures in the nervous system, along with factors such as language use, age of acquisition, proficiency, and level and medium of exposure, which potentially have more extensive clinical implications. Recent neuroimaging studies, although involving only isolated linguistic tasks, suggest that attained proficiency and the age of language acquisition may be determining factors in whether the two languages are subserved by the same neural circuits. Wong *et al.* (2005) found that even though both native Mandarin-speaking and English-speaking adults (who do not speak Mandarin) were able to discriminate Mandarin lexical tone patterns, a feature of the Mandarin language, the two groups used regions near the inferior frontal gyrus but in opposite hemispheres when doing so, presumably due to their corresponding attained proficiency or lack thereof in Mandarin.

Kim *et al.* (1997) found that early but not late bilinguals showed spatially overlapping brain activations in the left inferior frontal gyrus associated with sentence generation in first (L1) and second (L2) languages. Late bilinguals also showed activation in the left inferior frontal gyrus, but the centers of activation were further apart relative to the early bilinguals. However, since early bilinguals tend to have a higher level of proficiency in both languages, other studies have suggested that attained proficiency might be the most important factor in determining whether or not the two languages are subserved by the same neural circuit (Perani *et al.*, 1998; for a review, see Abutalebi *et al.*, 2001). Converging evidence on brain and bilingualism is being built and shows great promise for the effective assessment and rehabilitation of bilingual aphasics, especially when combined with existing knowledge in the neurobiology of monolingual aphasia. For example, studies suggest that perilesional areas may be recruited in aphasia recovery (Warburton *et al.*, 1999). If, as Kim *et al.* (1997) suggested, L1 and L2 in late bilinguals (who likely speak L2 with relatively low proficiency) are in the same gross neuroanatomic region but nonoverlapping, then one language may be associated with the perilesional areas, areas that surround the injured area, in certain instances of brain injury (i.e., one language might be more preserved). Consequently, relying on these perilesional areas (and the less disrupted language) in rehabilitation of these individuals might be more productive than rehabilitation of their early bilingual or even monolingual counterparts whose injury might have caused disruption of all language(s) they speak. It is important to note that although some ideas have been proposed (Green and Price, 2001), little evidence exists to support one rehabilitation strategy over another in bilingual aphasia.

Types of Bilingual Aphasias and Patterns of Recovery

Different types of bilingual aphasia, as well as different patterns of recovery, have been reported, involving not only speaking and understanding speech but also reading and writing (Streifler and Hofman, 1976). In addition to cases in which the two or more languages are equally impaired, it has been reported that some individuals showed selective aphasia in which signs of aphasia were evident in one language but not the other (Paradis & Goldblum, 1989). Differential aphasia has also been reported where different types of aphasia were shown in different languages (Albert and Obler, 1978; Silverberg and Gordon, 1979) – for example, conduction aphasia in one language and global aphasia in another. In addition, some individuals showed involuntary blending of grammatical elements (e.g., syntactic and morphologic units) of two languages (Glonig & Glonig, 1965; Perecman, 1984) – for example, combining syllables of two languages, thus creating a new word (Paradis, 1998). This is different from 'code switching,' which involves the alternative use of two or more languages in the same conversation (Milroy and Myusken, 1995). Code switching can function to convey emotional content, to emphasize or clarify the references being made, and to quote (De Fina, 1989), and it is considered to be an important aspect of normal bilingual discourse in many communities (Heller, 1995). Patterns of code switching were also found to be different between bilingual aphasics and normal individuals (De Santi *et al.*, 1995; Muñoz *et al.*, 1999).

It has been suggested that the degree and type of linguistic impairments in bilingual aphasics may be specific to the structures of the language. For example, it has been found that although Mandarin–Cantonese bilinguals showed impairment in the production of lexical tones (pitch patterns used to contrast word meaning), a greater degree of deficit was found in Cantonese production, possibly because Cantonese contains six tonal contrasts, whereas Mandarin contains only four (Lim and Douglas, 2000). In Friulian–Italian bilingual aphasics, the most frequently made errors in Friulian but not Italian involved the omission of the second obligatory pronoun, which is a typical feature of Friulian but not Italian (Fabbro and Frau, 2001). In other words, a type of linguistic impairment may not be apparent in one language because it does not occur as often (or at all) in that language. This also reinforces the idea of assessing multiple languages in bilingual aphasic individuals because impairments in one language do not necessarily predict the same impairments in the other.

With regard to patterns of recovery, as well as improvements in both languages in terms of comparable rate and extent (parallel recovery), individuals show the following kinds of recovery: selective recovery, when only one language improves; successive recovery, when one language improves before the other language; or differential recovery, when one language improves more so than the other. Most interestingly, some individuals show antagonistic recovery, namely improvement in one language but deterioration in another (Paradis and Goldblum, 1989). Some even demonstrate alternating antagonism, in which the improvement–deterioration pattern of the two languages alternates (Paradis *et al.*, 1982). It has also been reported that some individuals showed paradoxical recovery, namely when the patient recovered a 'dead' language – that is, a language the individual once had some knowledge of but had never used it premorbidly for ordinary communicative purposes. For example, Grasset (1884) reported a case of a monolingual French-speaking Catholic woman who started to speak single Latin words and prayers (the language of the church) a few days following a left-hemisphere stroke but was unable to speak French. It is worth noting that it is not known what single factor influences the pattern of recovery (Paradis, 1998). For example, it is not always the case that the language spoken most proficiently premorbidly will be the language affected the most or the least by brain injury or the language that will be recovered first.

Bilingual Aphasia Assessment

When evaluating a bilingual aphasic individual, various important issues warrant special considerations. First, a 'direct translation' is not the same as cross-language equivalency. Different languages have different (nonoverlapping) grammatical structures and vocabulary that can potentially influence how thoughts are expressed; consequently, certain linguistic impairments may or may not manifest themselves depending on the language, as suggested previously in the Mandarin–Cantonese and Friulian–Italian bilingual cases. Furthermore, languages are used in different social and cultural contexts, resulting in context-dependent interpretations even for the same utterance. Second, because bilingual aphasics use the two or more languages in different social settings, and because the two or more languages can be affected and recovered differently, all languages the individuals speak premorbidly need to be assessed in order to gain a more complete picture of the aphasia. Third, in addition to any formal measures, a thorough case history detailing use and proficiency of each language needs to be taken because it can potentially affect the rehabilitation process.

Different formal/standardized test batteries are available for assessing aphasics who speak different languages. These include tests that are originally constructed in English but then translated into other languages with considerations of the appropriate linguistic and cultural contexts and/or normative data for the specific groups. For example, there is a Cantonese version of the Western Aphasia Battery (Yiu, 1992), a Spanish version of the Boston Naming Test (Taussig *et al.*, 1992), and a Japanese version of the Communication Abilities in Daily Living (Sasanuma, 1991). In addition, there are also tests designed for assessing bilingual individuals, including the Bilingual Aphasia Test developed by Paradis and colleagues for more than 65 languages and 170 specific language-pair combinations [e.g., an Urdu version (Paradis and Janjua, 1987) and a Bulgarian–French version (Paradis and Parcehian, 1991)] and the Multilingual Aphasia Examination in Chinese, French, German, Italian, Portuguese, and Spanish (Rey and Benton, 1991).

Rehabilitation

Traditional approaches employed in aphasia rehabilitation still apply to rehabilitating bilingual aphasic individuals, such as language stimulation approaches that emphasize individual linguistic units

and processes such as grammar and naming, as well as compensatory approaches that target the individual's participation in vocational and social settings despite linguistic impairments. However, additional challenges exist when more than two languages are present. For example, should rehabilitation focus on one or two languages? If one, which one? No one set of widely accepted guidelines exists for selecting one or all languages in aphasia rehabilitation, and evidence and arguments exist for either consideration (Bond, 1984; Chlenov, 1948; Linke, 1979; Wald, 1958). Similarly, it is still unclear whether skills acquired from the rehabilitation of one language can be transferred to another. Evidence suggests that skill transfer across affected languages may be optimal if the languages are closely related (e.g., Spanish and Italian) (Paradis, 1998). As stated previously, different individuals use their multiple languages in different social and vocational settings. In rehabilitation, the affected individual and her or his family should be counseled to consider the preponderating need of one language over another. For example, the social penalty of linguistic impairments in English may be greater for Spanish–English bilinguals whose immediate peers are English-speaking, even though Spanish might be the more proficient language.

Conclusion

Basic knowledge of how multiple languages are represented in the brain and what factors influence representation undoubtedly have bearing on the clinical process. Moreover, careful documentation of linguistic impairment characteristics and the course of recovery in the two languages can also inform us about how the brain is organized. With increasing interaction between individuals from diverse linguistic and cultural backgrounds, due to factors such as immigration, globalization, and state unionization, the number and proportion of individuals who know and use more than one language will most likely increase. The clinical population as well as clinical needs will likewise increase. Thus, a greater basic and clinical understanding of bilingualism and the brain is warranted.

Bilingualism and Second Language Learning

T K Bhatia, Syracuse University, Syracuse, NY, USA

Introduction

There is a widespread perception in monolingual societies, particularly in the United States, that bilingualism is a rare and exceptional occurrence in communication. By contrast, from a global perspective, bilingualism is a world-wide phenomenon. In fact, global communication is often carried out through a speaker's second, third, or even fourth language. According to David Crystal (1997) approximately two-thirds of the world's children grow up in a bilingual environment which, in turn, leads to adult bilingualism/multilingualism. However, childhood bilingualism is not the only reason for adult bilingualism. A host of different factors (such as marriage, religion, education, linguistic plurality of a particular region, migration, jobs, government policies, urbanization, etc.) also lead to adult bilingualism. How, then, do humans become bilingual? Is adult second-language learning different from child-language learning? Is bilingual-language acquisition different from monolingual-language acquisition? Is early bilingualism different from late bilingualism? Does second language learning have adverse cognitive effects on children? And how are two (or more) languages represented in the brain? This chapter attempts to answer these and other questions concerning bilingual language learning and use.

Key Concepts

Before discussing language development among bilinguals, it is crucial to give an overview of key fundamental concepts concerning language development in children and adults. Also, it should be mentioned that the term 'second language learning' is used in a wider sense to include the learning of any additional language during a period ranging from childhood to adulthood. An additional language may be a language of the country or spoken outside the country (i.e. foreign language).

Acquisition vs. Learning

A child's process of learning languages is different from an adult's process. A child can learn any language relatively effortlessly, while the same task becomes rather challenging for adults. For this reason, some second language researchers (Krashen,

Paradis M (1990). 'Language lateralization in bilinguals: enough already!' *Brain and Language 39*, 576–586.

Introduction

There is a widespread perception in monolingual societies, particularly in the United States, that bilingualism is a rare and exceptional occurrence in communication. By contrast, from a global perspective, bilingualism is a world-wide phenomenon. In fact, global communication is often carried out through a speaker's second, third, or even fourth language. According to David Crystal (1997) approximately two-thirds of the world's children grow up in a bilingual environment which, in turn, leads to adult bilingualism/multilingualism. However, childhood bilingualism is not the only reason for adult bilingualism. A host of different factors (such as marriage, religion, education, linguistic plurality of a particular region, migration, jobs, government policies, urbanization, etc.) also lead to adult bilingualism. How, then, do humans become bilingual? Is adult second-language learning different from child-language learning? Is bilingual-language acquisition different from monolingual-language acquisition? Is early bilingualism different from late bilingualism? Does second language learning have adverse cognitive effects on children? And how are two (or more) languages represented in the brain? This chapter attempts to answer these and other questions concerning bilingual language learning and use.

Key Concepts

Before discussing language development among bilinguals, it is crucial to give an overview of key fundamental concepts concerning language development in children and adults. Also, it should be mentioned that the term 'second language learning' is used in a wider sense to include the learning of any additional language during a period ranging from childhood to adulthood. An additional language may be a language of the country or spoken outside the country (i.e. foreign language).

Acquisition vs. Learning

A child's process of learning languages is different from an adult's process. A child can learn any language relatively effortlessly, while the same task becomes rather challenging for adults. For this reason, some second language researchers (Krashen,

1985) distinguish between two types of mechanisms in language development: a subconscious process resulting in tacit knowledge of the language (i.e., 'language acquisition'), and a more conscious process (i.e., 'language learning'). While children go through the former process, adults undergo the latter in their quest to become bilingual.

The Critical Period Hypothesis and Its Biological Basis

In addition to degree of effort, it has been frequently observed that even very proficient bilinguals fall short of being perfect bilinguals. In spite of the complete mastery of syntax, their speech is marked by traces of the first language accent. Similarly, it is also shown that in spite of considerable effort and motivation, the ultimate attainment of some grammatical structures by adults is seldom achieved. To explain these and other differences in language acquisition and recovery from aphasia Lenneberg (1967) proposed the "critical period hypothesis," which is sensitive to age. This hypothesis claims that there is a period in the maturation of human organism, lasting from two years to puberty, in which nearly effortless and complete language acquisition is possible. Afterwards, this hypothesis notes, language learning requires more effort and motivation, largely because of a loss of brain plasticity resulting in the completion of the lateralization of the language function in the left hemisphere. Recent research claims have additionally shown that there are different critical periods for different grammatical structures of language. Since the accent (phonetics and phonology) of a second language is the most difficult to attain, the critical period for phonetics and phonology (approximately from five to seven years) is earlier than that for morphology and syntax. See Johnson and Newport (1991) and Bhatia and Ritchie (1999) for details.

Access to Universal Grammar (UG)

Children are born to acquire human languages. Regardless of gender, race, ethnicity, or nationality, every normal child is capable at birth of acquiring any human language. In theoretical studies following from the Chomskyan mentalistic framework, this innate ability is termed the access to universal grammar (UG). In this case, a child has full access to universal grammar, whereas an adult has either limited or no access. These and other universal principles of grammatical structures and principles of learning largely lead a child's language development. The role of parental input then becomes to trigger an appropriate value for innately given or set parameters, specific to the language to which the child is exposed. One such parameter, called the 'head parameter,' describes how a child does not have to even learn the specific word order of his/her language, but only has to choose between already specified values – head-initial or head-final – based on the nature of the input language. Children begin to learn to set parametric values even from the one-word stage. A Japanese child learns to choose the head-final system, whereas an English-speaking child chooses the head-initial value. These principles are generally refereed to as a child's language acquisition device (LAD).

Input and Learning Environment: Natural vs. Unnatural Settings

Usually children become bilinguals or multilingual in a natural way. A normal child can become a fluent bilingual by the age of five, for instance, without any formal training. In the process of acquiring a language, the role of input (motherese, etc.) or imitation is important but limited. Children do not learn a language by mindlessly imitating the input provided by mothers or caretakers. That is, while the role of parental input cannot be ruled out, language acquisition studies show that neither motherese nor imitation plays a significant role in a child's language development. Instead, this burden is carried by the child himself/herself. Research on child-language acquisition reveals that the child learns the language by using the 'rule formulation strategy.' For instance, an English-speaking child learns on his/her own that by the addition of the inflection '-ed' to a verbal stem, one generates the corresponding past tense form of the verb. In this process, the child over-generalizes and produces utterances such as 'I go-ed' [go-PAST]. Even after being corrected [i.e. provided negative evidence] by the mother or caretaker that the child meant 'I went' [go.PAST], the child still does not reject the rule s/he has formulated in his or her mind and which s/he still produces in utterances such as 'I went-ed' [go.PAST-PAST]. The role of the adult is thus to prevent the child's grammar from overgeneralization. In other words, the child has an innate capacity to acquire languages in an environment which is termed a 'natural' environment, whereas, by contrast, adults and school-age children learn language in formal settings such as schools and colleges through a formal instructional method.

Defining and Measuring Bilingualism

What is bilingualism and who is bilingual? Defining and measuring bilingualism is a very complex task due to the number and types of input conditions, biological, socio-psychological, and other non-linguistic factors that can lead to a varying degree

of bilingual competencies. In short, there is no widely-accepted definition or measures of bilinguals.

Instead, a rich range of scales, dichotomies, and categories are employed to characterize bilinguals. If a bilingual can understand but cannot speak a second language, such an individual is called a receptive bilingual, whereas a productive bilingual demonstrates a spoken proficiency in two languages. If the second language is acquired in a natural setting before the age of five that individual is termed an early bilingual, in contrast with a late bilingual who learns his second language after the age of five either in home or in schools. Labels such as fluent vs. non-fluent, functional vs. non-functional, balanced vs. unbalanced, primary vs. secondary, and partial vs. complete refer, either to a varying command in different types of language proficiency (e.g., spoken, listening, writing, etc.), or an asymmetrical relationship (dominance) between two languages. A compound vs. coordinate bilingual refers to the way two languages are processed in the brain. The list is by no means exhaustive. Other major distinctions such as simultaneous vs. sequential are discussed in the next section. Similarly, bilingualism can be viewed from individual, societal (attitudes towards bilingualism), and political (i.e., government policies toward bilingualism) perspectives.

In general, a bilingual person demonstrates many complex attributes rarely seen in a monolingual person. For that reason, a bilingual is not equivalent to two monolinguals, but something entirely different. This working definition of bilingualism is offered by Bloomfield (1933), who claimed that a bilingual is one who has a native-like control of two languages, i.e., a balanced bilingual (see Grosjean 1982 or Edwards, 2004 for more details).

Patterns and Mechanisms in Bilinglual Language Development

Providing either a natural environment or inputs in monolingual/dominant language speech communities is not a challenging task. The same is also true for those societies where social and political systems are conducive to bilingualism. For instance, in India, where bilingualism is viewed as natural, approved by society, and further nurtured by government language policies, linguistic groups and communities do not need to take any special measures to assure that their children receive input from two languages. In sharp contrast, in societies where bilingualism is not valued or where the language of a minority is distinct, it becomes imperative for families to plan meaningful strategies to ensure the smooth exposure to the family language. One such strategy that families employ in this second setting, described by Bhatia and Ritchie (1999) as "discourse allocation," restricts the use of one language to one social agent or social setting and the other language to other social situations. The various manifestations of such strategies are the following: (a) one-parent/one-language (e.g., the child's mother speaks one language and, the child's father speaks the other. This strategy was employed by Leopold (1939–1949) in his classic study of bilingual language development of his daughter, Hildegard; (b) one-place/one-language (e.g. speaking one language in the kitchen and the other elsewhere); (c) a language/time approach; and (d) a topic-related approach. Although the discourse allocation approach is better than providing no input and thus raising a monolingual child, it leads to different patterns in bilingual language development than developing bilingualism in a natural setting. For instance, during the early stages of Hildegard's bilingualism, she developed a rule that fathers speak German and mothers speak in English.

Childhood Bilingualism

Other factors such as age and amount of exposure to the two languages also result in differences in the pattern of childhood bilingualism. The distinction between simultaneous and sequential bilinguals in research on bilingual language acquisition is based on age and the degree of exposure to two languages. When the child is exposed to two languages to more or less the same degree from birth onward, the pattern of language development is referred to as simultaneous, whereas sequential bilingualism describes the attainment of one language first and the second language later, preferably before the age of seven. Similarly, the term late bilingual is used for those sequential bilinguals who acquire their second language at a relatively younger age than adults learning a second language. Although there is unanimous agreement among researchers about the validity of the simultaneous and sequential bilinguals, there is no consensus among scholars about the exact line of demarcation between the two. See McLaughlin (1984) and De Houwer (1995) for either theoretical or methodological grounds.

One of the most intriguing aspects of the childhood bilingualism is how children learn to separate the two languages, particularly in a natural setting (i.e., a simultaneous bilingual) in initial stages. After all, when parents provide input, they do not tag or prime their input with a language identification label. Even if parents go to the absurd length of identifying the language of each word or sentence they use, these labels are semantically empty for

children. Furthermore, bilingual parents unwittingly make the task of separating the two languages even harder for children because of their normal tendency to mix two languages. In short, a child is provided with three distinct types of linguistic inputs: two languages, each in an unmixed/pure form, and one with a mixture of two languages. Given this state of affairs, how does the child learn to separate the two languages in question? This task is not challenging for a monolingual child because only one language serves as a source of input. The two hypotheses which attempt to shed light on this question are the unitary system hypothesis and the dual system hypothesis.

According the unitary system hypothesis (Volterra and Taeschner, 1978), the child undergoes three stages before s/he is able to separate two input languages. During the first two stages, the child experiences confusion. During the first stage, s/he is unable to distinguish the two lexicons and grammars of the linguistic systems. At this stage, they have a single lexicon made up of items drawn from the lexicons of both languages. Hence, no translational equivalents or synonyms are found in their vocabulary. Volterra and Taeschner claim that their two bilingual subjects at the ages of 1 year 10 months and 1 year 6 months had a hybrid list of 137 words with no translational equivalents. During the second stage, the child slowly learns to separate the two lexicons, but is still unable to separate the grammatical systems. Cross-linguistic synonyms emerge, but the child applies the same set of syntactic rules to both languages. It is only during the third stage that the child becomes capable of separating the two sets of vocabularies and grammars. Findings of recent research reveal that the unitary system hypothesis cannot sustain the scrutiny of the succeeding research and the evidence motivating the three stages of bilingual language development is full of shortcomings and contradictions both on methodological and empirical grounds.

The dual system hypothesis states that bilingual children, based on their access to Universal Grammar and language specific parameter setting, have the capacity of separating the two grammars and lexical systems right from the beginning. A wide variety of cross-linguistic studies (e.g., different input conditions – one parent/one language and mixed input condition; and different word order types) lends support to this hypothesis. For instance, in a study devoted to the language development of a Hindi-English bilingual child, it is clear that at age 2, the child is capable of developing two distinct lexicons using a syllabification strategy. At the age of 1 year 7 months, two different word orders develop – SVO [subject-verb-object] for English and SOV for Hindi. For a more detailed treatment of the shortcomings of the unitary system hypothesis and the strengths of the dual system hypothesis, see Bhatia and Ritchie 1999: 591–614.

Another fascinating feature of bilingual speech is that, not only are bilinguals capable of keeping the two linguistic systems separate, but they often mix them either within a sentence or inter-sententially. This behavior is often termed 'code-mixing' or 'code-switching' in sociolinguistic literature. Depending upon the theoretical and empirical objectives of their research, some researchers do not distinguish between the two terms and use them interchangeably; for those researchers who distinguish between the two, the code-mixing refers to intra-sentential mixing while the term code-switching refers to the intersentential mixing in bilinguals. Both bilingual children as well as adults show this behavior. What explains this behavior of language mixing? Earlier research attempted to explain it in terms of the language deficiency hypothesis: it was claimed that bilinguals in general and children in particular have language gaps. As claimed by the unitary system hypothesis the lack of synonyms compels them to mix the two lexical systems during stage I. Similarly, stage II yields the mixing of two language systems due to confusion. In other words, the lack of proficiency in either one language (i.e., the absence of balanced bilingualism) or both languages (i.e., semi-bilingualism) leads to mixing.

The language augmentation hypothesis is capable of offering deeper insights into the bilingual mixing behavior. As it has been shown earlier in the discussion of the dual system hypothesis, children do not go through the initial stages of treating the two linguistic systems as if they were one system, but begin to distinguish them immediately. The consideration of optimization leads bilinguals to mix language with an aim to get maximum mileage from the two linguistic systems at their disposal. An analogy drawn from the beverage industry further explains this point. The separation of juices (e.g., apple vs. orange juice) renders two distinct tastes. However, if one mixes the two juices, the result is a new taste, a distinct from the two pure juices. The same is true of bilingual language mixing. Research on the linguistic and sociolinguistic motivations for language mixing both in children and adults shows that such considerations as semantic domains and semantic complexity (an item less complex or salient in one language), stylistic effects, clarification, elaboration, relief strategy (i.e., a linguistic item is temporarily unavailable in one language), interlocutor's identification, discourse strategies of participants/topics, addressee's perceived linguistic capability and speaker's own linguistic

ability, and other complex socio-psychological reasons, such as attitudes, societal values, and personality, prompt bilinguals to mix two languages. The list of motivations is by no means exhaustive (see Bhatia and Ritchie, 1996, for more details).

Adult Bilingualism: Second Language Learning

In contrast to sequential childhood bilingualism, adults who learn a second language after they have learned their mother tongue experience the learning of a second language as a laborious and conscious task. As pointed out earlier, unlike children who are able to universally and uniformly acquire native competency in their mother tongue, adults rarely achieve native-like competency in their second language. Depending on the level of their motivation and hard work, adults can learn a second language with varying degrees of competence. However, there comes a point during the second language learning that even the most talented learner cannot bypass the stage of 'fossilization.' This stage is marked with second language errors which no amount of training can correct. For these reasons, second language (L2) learning is viewed as fundamentally different from first language (L1) acquisition. The hypothesis which aims at accounting for these differences between the child and the adult language is termed the fundamental difference hypothesis.

In spite of the asymmetrical relation between L1 and L2 learning, one should not draw a conclusion that there is nothing in common between the two. What is common between L1 and L2 learners is that both undergo stages of language development. In other words, like L1 learners, in the process of grammar construction, L2 learners undergo stages of development: the intermediate stages of grammar development between the initial stage and the ultimate stage are termed interlanguage grammars. Take the case of the development of negation in English L1 and L2 learners. The grammar of negation in L2 learners of English shows the same stages of development as in L1 English learners – Stage I: the sentence-initial placement of negation; Stage II: preverbal placement of negation with no auxiliary verb; and Stage III: preverbal placement of negation with an appropriate auxiliary verb.

Native Language Influence and Dominance

An important way in which L2 learning is different from L1 learning is the influence of the mother tongue on second-language learning. The mother tongue or L1 plays an important role in the process of L2 acquisition. Research on grammatical errors of L2 shows that L2 learners transfer the grammatical rules – phonetic, phonological, morphological, and syntactic rules – of L1 to their second language. An English-speaking learner of Hindi has difficulties in hearing and producing a four-way contrast between Hindi aspiration and voicing contrast (i.e., unvoiced unaspirates, unvoiced aspirates, voiced unaspirates, and voiced aspirates).

It would be a gross simplification to claim that L2 learners transfer all grammatical features of L1 to L2. Adult learners possess a relatively higher level of logical and cognitive ability than do children; therefore, these qualities color their second language learning. For instance, English-speaking learners of Hindi will not translate <u>there</u> in these sentences:

1. There is a chair in the room
2. The chair is over there

in an identical way (i.e. by choosing the remote locative adverb in both cases). Similarly, it would be an oversimplification to claim that childhood bilingualism is free from the dominance relationship between the two languages. Not only does the mother tongue influence second language acquisition in children, it also affects their school achievement.

Approaches to Second Language Learning

In adult language acquisition research, the term second language is used in a wider sense to include both the acquisition of a second language which may or may not be foreign to a country. However, in the context of language teaching the distinction between the two is made to highlight major differences in the learning aims, teaching methods, and the achievement levels to be attained.

A number of approaches have been developed to facilitate the learning of second/foreign languages. Some of the following are notable:

1. Grammar-translation method: Following the tradition of teaching classical languages such as Greek, Latin, and Sanskrit, this method places emphasis on memorization and rote learning. Learners memorize nominal and verbal paradigms of the second language and translate L1 into L2 or vice versa. Very little emphasis is placed on developing spoken proficiency in the foreign language, while reading and written comprehension receives overwhelming importance. This method is perhaps the oldest method of language teaching which dates back to the 19th century.
2. The direct method: Also known as oral or natural methods, it departs from the grammar-translation method in three important respects: one, memorization receives a back seat in the learning of the second language; two, special emphasis is placed on acquiring spoken and listening competencies;

and three, the introduction of the target language is free from any reference to the native language of learners. Native language is never used as a tool to explain either grammar or other intricacies of the target language usage. This model attempts to simulate the native speaker environment of the target language. However, in actual practice there are severe constraints on replicating the natural setting of the native speaker's learning environment in an actual classroom setting.

3. The audio-lingual method is a byproduct of World War II during which the United States experienced an urgent need to quickly train its troops in foreign languages for overseas military operations. An emphasis is placed on spoken and listening competencies, rather than on written ones.
4. The structural method: In order to speed up the acquisition of foreign languages, insights of structural linguistics were applied to language teaching. This method exposes learners to different structural patterns and transformation drills.

Audio-lingual structural models assume that L2 is acquired through imitation. The discussion in the key concept section shows the limitation of this model. A number of other methods such as the natural approach and 'suggestopedia' have been proposed, but the fact remains that no method has a grip on the complexity involving learning a second language.

Bilingual Education: Additive vs. Subtractive Bilingualism

Teaching children a school language, particularly if the school language is different from the child's home language, is one of the major challenges for bilingual education programs. Bilingual education programs in America aim at minority students learning English. Such programs have attracted a great deal of controversy on the basis of their merit and outcome. While there is rapid growth of bilingual education programs in the United States, the aim of such programs is not always to introduce additive bilingualism which ensures the maintenance of the child mother tongue, while learning the school/dominant language. A large number of bilingual education programs in the United States aim at subtractive bilingualism. In other words, while they offer children a transition to learning the school/majority language, in that process they do not ensure the maintenance of the child's mother tongue.

In contrast, the language policies of bilingual nations such as India, Canada, and Switzerland are very conducive to the promotion of language rights for minority languages. The government of India, for instance, favors the advancement of linguistic diversity and pluralism by the introduction of the Three Language Formula, which calls for trilingualism in education. In addition to learning two national languages, Hindi and English, students are expected to learn a third language beyond their native tongue. For example, in northern India, students are expected to learn one of the four Dravidian languages (Tamil, Telugu, Kannada, and Malayalam) from southern India.

While bi- or multi-lingual education programs like India's do not view bilingualism in general and the maintenance of minority languages in particular as a threat to national integration, this is not the case with bilingual education in the United States. U.S. educational policies are not conducive to linguistic and cultural diversity.

A notable feature of the Canadian bilingual education program is termed the language immersion program. Introduced in the 1960s in Quebec, the program was introduced at the request of the English-speaking minority to provide their children a high level of proficiency in schools in the dominant language of the region, French. Children were immersed in schools in the second language of students (i.e., French) in which children used their mother tongue to communicate with a bilingual teacher who would reply in French. This process leads children from what Cummins (1981) calls basic interpersonal communication skills (BICS) proficiency to cognitive-academic language proficiency (CALP) in the school language. BICS refer to the language proficiency level of students with restricted vocabulary and simpler syntax, whereas CALP requires a type of proficiency suitable for academic pursuits – a developed vocabulary and sufficiently complex syntax suited for abstract and analytical thinking. The success of the Canadian language immersion model continues to generate enthusiasm and controversy in bilingual education in the United States.

Socio-Psychological Factors

Successful language learning not only depends on teaching methods but also on learners' motivation, intelligence, opportunities, and other factors, such as their attitude toward the target language and culture. Keeping in mind the motivation and the learners' attitudes, there are two types of learners: instrumental and integrative learners. Instrumental learners, who learn a language for the purpose of gaining external rewards (monitory gains, good jobs, etc.), however, tend to be less successful learners than integrative learners, who have a positive attitude toward the culture of the target language. Psychological factors such as the affective filter (Krashen, 1985)

either inhibit or promote the learning of a second language: negative influences such as anxiety, lack of self-confidence, and inadequate motivation can create serious obstacles to successful language learning. Due to a lack of self-esteem and a higher level of performance anxiety, minority children tend to raise the affective filter, which results in the reduction of comprehensible input. Consequently, it takes a toll on their progress in language acquisition. Similarly, since adults show more self-consciousness than children, they put themselves in a disadvantageous position in terms of language acquisition.

Effects of Bilingualism

Does bilingualism have an adverse linguistic and cognitive effect, particularly on children? Earlier research in the United States pointed out that exposing children to more than one language during their childhood leads them to semi-bilingualism and confusion. Crowding their brain with two or more languages, this research suggested, not only leads children to linguistic deficiency, both in competence and performance levels (semi-lingualism, stuttering, etc.), but also to a wide variety of cognitive and psychological impairments such as low intelligence, mental retardation, left-handedness, and even schizophrenia.

Research by Peal and Lambert (1962), however, put to rest such a negative view of bilingualism: their findings and the work of succeeding researchers provide ample evidence that these negative conclusions of earlier research were premature, misguided (biased toward immigrant communities), and unnecessarily pessimistic. Solid on methodological grounds, Peal and Lambert's study revealed a positive view of bilingualism, including the conclusion that bilingual children demonstrate more cognitive flexibility than monolinguals. Contrary to previous studies, bilinguals performed better than monolinguals in both verbal and non-verbal measures. The study, which was conducted in Montreal, was revolutionary in its own right, changing the face of research on bilingualism forever (see Hakuta, 1985: Chap. 2 for details). This study has been replicated in a number of countries confirming the positive effects of bilingualism.

Conclusions

A number of diverse and complex conditions and factors lead to life-long bilingualism. These factors – biological, social, psychological, and linguistic – account for a varied pattern amongst bilinguals, witnessed around the world. Thus, a bilingual is neither two monolinguals in the brain, nor are two bilinguals clones of each other. These complexities indicate why no theory of language learning and/or teaching is capable of explaining bilingual verbal behavior and the mechanisms leading to bilingual language development.

Binding Theory

A Asudeh, Carleton University, Ottawa, Canada
M Dalrymple, Oxford University, Oxford, UK

What Is Binding?

Binding theory concerns syntactic restrictions on nominal reference. It particularly focuses on the possible coreference relationships between a pronoun and its antecedent (the nominal that a nondeictic pronoun depends on for its reference). For instance, in (1a) *himself* must refer to the same individual as *he*. In contrast, in (1b) *her* cannot refer to the same individual as *she*. Instead, the sentence must mean that some person voted for some other person.

(1a) He voted for himself.
(1b) She voted for her.

Pronouns like *himself* or *ourselves*, which must corefer with some other noun phrase in the sentence, are called reflexive pronouns or reflexives. Pronouns like *she*, *her*, and *us* are called nonreflexive pronouns. Two nominal expressions that corefer, or refer to the same individual or individuals, are annotated by identical subscripts; if two nominals do not corefer, they are annotated with different subscripts:

(2a) He$_i$ voted for himself$_i$.
(2b) She$_i$ voted for her$_j$.

In an example like *He$_i$ voted for himself$_i$*, we say that the reflexive pronoun *himself* is bound by *he*, and that *he* is the binder of *himself*.

Reciprocals like *each other* and *one another* must also be bound by a local antecedent and are grouped in binding-theoretic terms with reflexives:

(3a) They$_i$ voted for each other$_i$.
(3b) * I$_i$ voted for each other$_j$.

Reflexives and reciprocals are together called anaphors.

Some major works on binding are Faltz (1977), Wasow (1979), Chomsky (1981, 1986), Reinhart (1983), Dalrymple (1993), Reinhart and Reuland (1993), and Pollard and Sag (1994). Huang (2000) contains a rich cross-linguistic survey of pronominal systems. Büring (2004) provides a recent comprehensive overview of the syntax and semantics of binding and presents a new synthesis.

Binding Conditions

Binding theory is typically stated in terms of conditions that refer to three key aspects: the class of nominal involved, the syntactic region that constitutes the domain of binding, and a structural condition on the syntactic relation between a nominal and its potential binder.

Classes of Nominals

For the purposes of binding theory, nominals are traditionally partitioned into several classes, as shown here:

(4)

The first major division is between pronouns and nonpronouns. Pronouns are then further subdivided into reflexives and reciprocals, which are collectively referred to as 'anaphors,' and nonreflexive pronouns, often simply called 'pronominals' or 'pronouns' (in opposition to anaphors). We will here refer to nonreflexive pronouns as 'pronominals,' reserving the term 'pronoun' for the class that includes anaphors and other pronouns. This yields three classes for the purposes of binding theory: anaphors, pronominals, and nonpronouns. Each class is governed by its own binding condition.

Binding Domains

Traditional definitions of binding domains distinguish local from nonlocal domains. Consider the following sentence:

(5) Bill$_i$ said that [Gonzo$_j$ voted for himself$_{*i,j}$]

The reflexive *himself* must be bound in its local domain, here the subordinate clause *Gonzo voted for himself*. The only appropriate binder in this domain is *Gonzo*. The reflexive cannot be bound by the higher subject *Bill*, which is outside the reflexive's local domain. This is indicated by placing the marker of ungrammaticality (*) beside the illicit index.

A pronominal in the same position must not be bound in its local domain:

(6) Bill$_i$ said that [Gonzo$_j$ voted for him$_{i,*j}$]

The local domain for the pronominal is also the subordinate clause, and it cannot be bound in this domain. It can, however, be bound by the matrix subject, which lies outside the local domain.

Command

Besides a syntactic domain condition, binding involves the requirement that the binding nominal be in a structurally dominant position. This required relation between a pronoun and its binder is called 'command' and is defined in different ways in different theories. The structural condition on binding means that certain elements cannot be binders, even if they fall within the correct syntactic domain:

(7) Gonzo$_i$'s friend$_j$ voted for himself$_{*i,j}$.

The entire subject *Gonzo's friend* can bind the reflexive, but the possessor *Gonzo* cannot, because the possessor does not command the reflexive.

We have thus far seen that anaphors must be bound within some local domain and that pronominals cannot be bound within some local domain. Nonpronouns cannot be bound in any domain, whether local or nonlocal:

(8a) * He$_i$ voted for Bill$_i$.
(8b) * He$_i$ said that Gonzo voted for Bill$_i$.
(8c) When he$_i$ voted for George, Gonzo$_i$ was drunk.

In (8a) and (8b), the pronoun is in the proper structural relation to command the name. Since this results in the nonpronoun being bound, the sentences are ungrammatical on the indexation indicated. In (8c), by contrast, the pronoun is not in the proper structural relation to command the name, because the pronoun is too deeply embedded. Although the pronoun and the name corefer, as indicated by the coindexation, there is no binding relation, and the sentence is grammatical.

Bringing these ideas together, a typical statement of binding conditions is as follows (based on Chomsky, 1981):

A. An anaphor (reflexive or reciprocal) must be bound in its local domain.
B. A pronominal (nonreflexive pronoun) must not be bound in its local domain.
C. A nonpronoun must not be bound.

Following Chomsky (1981), these binding principles are often referred to as Principle A, the condition on anaphors; Principle B, the condition on pronominals; and Principle C, the condition on nonpronouns. Principles A, B, and C are also called Conditions A, B, and C.

Variation in Structural Relation

All versions of binding theory incorporate some notion of structural domination or superiority as a component of the binding relation. We referred to this relation above as command. One commonly assumed version of command is the tree-configurational relation of c-command (Reinhart, 1983):

(9a) A c-commands B if and only if A does not dominate B and the first branching node dominating A also dominates B.

(9b)

In the tree in (9b), the first branching node dominating A, labeled X, also dominates B, and A does not dominate B. Therefore, A c-commands B. B does not c-command A, because the first branching node dominating B is Y, and Y does not dominate A.

Other tree-based definitions of command have been proposed; in them, command is relativized to nodes other than the first branching node. For example, the similar relation of m-command makes reference to the first maximal projection dominating A. Thus, in diagram (9b), A m-commands B if X is a maximal projection (*see* **X-Bar Theory**). Notice also that if X is a maximal projection and Y is not a maximal projection, then B also m-commands A because the first maximal projection dominating B dominates A and B does not dominate A. Some literature on binding continues to use the term 'c-command' but defines it as m-command.

Other theories define a command relation on linguistic structures other than trees. In lexical functional grammar (LFG), command is defined on f(unctional)-structures, which represent predicates and their adjuncts and subcategorized grammatical functions. The command relation relevant for binding in LFG is called 'f-command' and is defined as follows:

(10a) An f-structure A f-commands an f-structure B if and only if A does not contain B and every f-structure that contains A also contains B.

(10b)

$$X\begin{bmatrix} F_1 & A[\ ] \\ F_2 & Y\begin{bmatrix} F_3 & B[\ ] \end{bmatrix} \end{bmatrix}$$

In the f-structure in (10b), the f-structure labeled A f-commands B: A does not contain B, and the f-structure X that contains A also contains B. B does not f-command A because there is an f-structure Y that contains B but not A. Notice that in (10), A and Y f-command each other, just as in a tree there

is mutual c-command between sisters. Since A can be the subject and Y the object, we need an additional principle to ensure that the subject binds the object but not vice versa. Otherwise a perfectly grammatical sentence like (11) would be a Principle B violation because the object reflexive would bind the subject pronominal.

(11) He$_i$ injured himself$_i$.

Cases of mutual f-command like the above occur not just between subjects and objects but among all coarguments of a given predicate. Such cases are handled by an independently motivated relational hierarchy of grammatical functions based on the notion of obliqueness, in which the subject outranks the object, which in turn outranks the other arguments.

In head-driven phrase structure grammar (HPSG), grammatical functions are encoded on SUBCAT (subcategorization) lists, which are ordered according to the aforementioned obliqueness hierarchy: the subject is the first member of SUBCAT, the object is the second, and so on. Early work in HPSG defined a version of command called o-command on the SUBCAT list, in terms of this obliqueness relation. A simplified definition of o-command follows:

(12a) A o-commands B if and only if A does not contain B and A precedes B on a SUBCAT list, or A o-commands X and X contains B.

(12b)

$$\text{SUBCAT}\left\langle \text{A}, \ldots, \text{X}[\ldots \text{B} \ldots] \right\rangle$$

In the SUBCAT list in (12b), A o-commands B because A o-commands X and X contains B. B does not o-command A, on the other hand, because B does not precede A on a SUBCAT list and B does not o-command anything that contains A. The o-command relation in HPSG and LFG's f-command relation are similar in that they are defined on structures that encode grammatical functions. The two theories are also similar in using the relational hierarchy to define binding constraints.

More recent work in HPSG (Manning and Sag, 1999) defines binding on the ARG-ST (argument structure) list, a basic representation of argument structure, rather than on SUBCAT. The ARG-ST version of HPSG binding replaces o-command with a-command, where a-command can be defined by replacing all mention of o-command in (12) with a-command and all mention of SUBCAT with ARG-ST. To the extent that ARG-ST encodes thematic relations like agent (logical subject) and patient (logical object), the a-command version of HPSG binding is related to proposals that define the structural binding relation on a thematic hierarchy, such as Agent > Goal > Theme (Jackendoff, 1972; Wilkins, 1988).

Variation in Binding Domain

Some theories assume that the local domain for the anaphoric and pronominal binding conditions (Principles A and B) is the same: anaphors are required to be bound in exactly the same domains in which pronouns are required not to be bound. For example, Chomsky (1981) proposed that the local binding domain for both anaphors and pronominals is the governing category, where a governing category for an element is the minimal domain containing a subject and the head that selects the element. This predicts that anaphors and pronominals are in complementary distribution, a prediction that seems to be borne out by examples like the following:

(13a) Gonzo$_i$ saw himself$_i$/*him$_i$.
(13b) Gonzo$_i$ thought that George liked him$_i$/ *himself$_i$.

Huang (1983) subsequently pointed out that the prediction above is incorrect, based on examples like the following:

(14a) They$_i$ saw each other$_i$'s pictures.
(14b) They$_i$ saw their$_i$ pictures.

(15a) They$_i$ saw pictures of each other$_i$/themselves$_i$.
(15b) They$_i$ saw pictures of them$_i$.

In (14) and (15), the anaphors and pronominals occur in identical positions: there is no complementary distribution. Chomsky (1986) addressed this problem by proposing that the local domain for anaphoric and pronominal binding is the smallest domain in which the binding constraint in question could be satisfied. For the anaphoric cases in (14a) and (15a), there is no possibility of satisfying Principle A within the noun phrase that contains the anaphor. Therefore, the anaphor's local domain becomes the domain of the containing NP; since the anaphors in (14a) and (15a) are bound in this slightly larger domain, the sentences are grammatical. In contrast, the local domain for the pronominals in (14b) and (15b) is the smaller domain constituted by just the NP containing the pronominal since Principle B is satisfiable within this domain.

Although the English examples above are amenable to a treatment along these lines, data from other languages indicate that a unified notion of local binding domain for all anaphora is inadequate. Some languages have several anaphors, each with a different local domain. Consider the two Norwegian reflexives *seg* and *seg selv*:

(16a) Jon$_i$ fortalte meg om seg selv$_i$ /*seg$_i$
J. told me about self
'Jon told me about himself.'

(16b) Jon$_i$ hørte oss snakke om seg$_i$ /*seg selv$_i$
J. heard us talk about self
'Jon heard us talk about him.'

Based on data like the above, Manzini and Wexler (1987), Dalrymple (1993), and others argued that binding constraints must be parameterized as lexical properties of particular pronouns. Thus, part of the lexical entry for *seg selv* specifies that it must be bound to an argument of the same syntactic predicate, whereas the lexical entry for *seg* specifies that it must be bound in the minimal finite clause in which it is contained but cannot be bound by a co-argument. Thus, a single language can have various anaphors, each with its own binding domain. Indeed, Norwegian has a third reflexive (*ham selv*) that has yet a different binding domain.

Furthermore, many languages have long-distance reflexives that must be bound within the same sentence but place no further restrictions on their binding domain (Koster and Reuland, 1991; Cole *et al.*, 2001). The possibility for a reflexive to allow long-distance binding has been claimed to correlate with its morphological form (Faltz, 1977; Pica, 1987): morphologically complex reflexives like English *himself* or Norwegian *seg selv* allow only local binding, whereas morphologically simple reflexives like Norwegian *seg* allow long-distance binding.

A puzzle that has gone largely unaddressed in the literature on binding is the local nature of reciprocal binding. Although there are many examples of reflexive pronouns that need not be locally bound, there seem to be no comparable examples of long-distance reciprocals. Treating reflexives and reciprocals as anaphors that must obey the same binding principle does not lead us to expect this difference in behavior.

Defining the Binding Relation

In all of the examples we have examined so far, the relation between the pronoun and its potential antecedent has involved either coreference or noncoreference. In more complicated cases involving plurals, the possibility of partial overlap of reference arises. Lasnik (1981) discussed examples like (17), which he marked as ungrammatical:

(17) * We like me.

In this example, the speaker is included in the referent of the subject, leading to the impossibility of a pronoun referring to the speaker in object position. Lasnik also claimed that in (18), the group of people referred to as *they* cannot include the referent of *him*:

(18) They like him.

Examples such as these have prompted some researchers to revise the treatment of the binding relation by introducing a more complicated indexing system.

Higginbotham (1983) proposed that the symmetrical coindexation mechanism be replaced with an antisymmetrical linking mechanism, represented by an arrow notation:

(19) John said that he thought Mary liked him.

This mechanism is particularly adept at representing split antecedents—cases in which a plural pronoun's antecedent is made up of two syntactically separate nominals:

(20) John told Mary that they should leave.

The referential dependency of the pronoun on the two nominals is represented by linking it to both antecedents simultaneously.

The most extensively explored revision to the standard coindexation mechanism is the proposal to represent the index for plural noun phrases as a set containing an index value for each individual in the set (Lasnik, 1981). In (21), *they* refers to two individuals, *i* and *j*. This index value is used to prevent the object *him* from referring to either individual *i* or individual *j*:

(21) They$_{\{i,j\}}$ like him$_{*\{i\}/*\{j\}/\{k\}}$.

This move necessitates a corresponding adjustment to the binding condition for pronominals, which must now refer to overlap of set-valued indices rather than simply to identity of atomic indices. For example, Principle B would be reformulated to require that the index of a pronominal must not overlap with the index of a commanding nominal in the pronominal's local domain. Overlap is understood in set-theoretic terms: a set index A does not overlap with a set index B if and only if the intersection of A and B is empty. Notice that this treatment of indexation also blocks readings in which there is overlapping reference between plural pronouns:

(22) They$_{\{i,j\}}$ like them$_{*\{i,j\}/*\{i,k\}/*\{j,k\}/\{k,l\}}$.

With the move to set-valued indices and a notion of overlap based on intersection, the binding relation no longer concerns coreference and noncoreference, but rather coreference and disjoint reference. Principle B requires disjoint reference, as discussed above, whereas Principle A still requires coreference, i.e., total overlap/equality of set indices:

(23a) They$_{\{i,j\}}$ like himself$_{*\{i\}/*\{j\}}$.
(23b) They$_{\{i,j\}}$ like themselves$_{\{i,j\}}$.
(23c) They$_{\{i,j\}}$ like themselves$_{*\{i,k\}/*\{i,j,k\}}$.

Example (23a) is ungrammatical because there is no coindexation that can make the set index of the reflexive equal to the set index of the antecedent (*himself* cannot be plural). Example (23b) is, by contrast, grammatical: the set index of the reflexive and its antecedent are equal. Example (23c) illustrates that overlap of reference or intersection is not sufficient for reflexive binding, since the sentence cannot have an interpretation in which a group of people likes another group of people that includes only some of the first group.

A problem for this approach is that there are grammatical examples that appear to be structurally identical to the ungrammatical examples above. Berman and Hestvik (1997) presented the following example, which, while syntactically similar to (18), is acceptable for many speakers:

(24) John and Mary often connive behind their colleagues' backs to advance the position of one or the other. This time they got her a job in the main offce.

Since *they* refers to John and Mary and *her* refers to Mary, the grammatical sequence *they*$_{\{i,j\}}$ *got her*$_{\{j\}}$ *a job* appears to be identical in binding-theoretic terms to the ungrammatical indexing *they*$_{\{i,j\}}$ *like him*$_{\{j\}}$ for (18).

Reinhart and Reuland (1993) and Kiparsky (2002) proposed that the crucial difference between ungrammatical and grammatical instances of overlapping reference lies in whether the predicate taking the pronominal as an argument is interpreted collectively or distributively. If the predicate is a collective predicate, then overlapping reference is possible, but if it is a distributive predicate, then overlapping reference is impossible. This is meant to derive the difference between the grammatical (25a) and the putatively ungrammatical (25b):

(25a) We elected me.
(25b) * We voted for me.

The idea is that *elect* is a collective predicate and the overlapping reference is allowed, but *vote for* involves each individual voting separately and is therefore distributive, rendering the sentence ungrammatical. Similarly, the context of (24) makes it clear that John and Mary together got her a job – the predicate is interpreted collectively. However, many speakers find (25b) just as grammatical as (25a), even though *vote for* is presumably equally distributive for these speakers. In addition, certain grammatical instances of overlapping reference do not obviously involve collective predication or do not involve predicates whose collective reading is logically distinct from their distributive reading (Büring, 2004), and certain ungrammatical instances of overlapping reference similarly do not involve obviously distributive predicates.

Semantic Approaches to Binding Theory

Bach and Partee (1980) provided a semantic alternative to syntactic binding theories, couched in Montague semantics. They argue that functional application in the semantics yields a sufficiently rich structural relation to model binding theory, provided that certain auxiliary assumptions are made. These assumptions can be thought of as analogous to binding constraints. Bach and Partee principally sought to show that a semantic binding theory achieves a coverage equal to syntactic binding theories (of the time), but they noted that one advantage of their semantic binding theory is that it generalizes readily to languages whose syntactic structure is less configurational. These languages nonetheless have rules of semantic composition similar to those of configurational languages, even if notions like subject and object in these languages are not defined configurationally. In this respect, their binding theory is similar to syntactic binding theories that define binding in terms of grammatical functions rather than on structural configurations, which only indirectly model grammatical functions. The HPSG and LFG binding theories discussed in an earlier part of this article are two such theories.

Keenan (1988) also offered a semantic binding theory, but one based on his semantic case theory rather than on Montague semantics. His binding theory deals principally with reflexives and shares with the Bach and Partee theory (1980) the advantage of applying readily to nonconfigurational languages. The basic insight behind Keenan's theory of reflexivization is that a reflexive denotes a function SELF that when applied to a binary relation R returns the set of x such that $\langle x, x\rangle$ is in R. The function SELF thus reduces the arity of the relation that it applies to. This treatment of reflexivization as an arity-reducing function is shared by Bach and Partee (1980).

Reinhart and Reuland (1993) offered a mixed syntactic/semantic approach to binding theory. Their theory centers around the notion of predication, with syntactic predicates distinguished from semantic predicates. A semantic predicate is a predicate and its semantic arguments. A syntactic predicate is a head, all of its selected internal arguments, and, crucially,

an external argument (a subject). Reinhart and Reuland proposed the following two binding conditions:

1. A reflexive-marked syntactic predicate is reflexive.
2. A reflexive semantic predicate is reflexive-marked.

A predicate is reflexive-marked if and only if one of its arguments is a reflexive. A predicate is reflexive if and only if two of its arguments are coindexed.

Given these conditions, a sentence like *Gonzo$_i$ injured himself$_i$* is allowed since *injured* is a reflexive-marked predicate (marked by *himself*), that is reflexive (the arguments of the predicate are coindexed). The sentence **Gonzo$_i$ injured him$_i$* is disallowed because the predicate is reflexive but not reflexive-marked. And the sentence **Gonzo$_i$ said Kate injured himself$_i$* is unacceptable since *injured* is reflexive-marked but not reflexive (*Kate* and *himself* are not coindexed).

Exemption and Logophoricity

Certain formulations of binding theory allow some occurrences of anaphors to be excluded from the purview of binding constraints. For example, HPSG's Principle A states that a locally commanded anaphor must be locally bound (where the command relation is either o-command or a-command, depending on the version of the theory, as discussed above). If an anaphor is not locally commanded, HPSG's Principle A does not apply to it: the anaphor is exempt from binding (Pollard and Sag, 1994). For example, the reflexive in the following sentence is an exempt anaphor:

(26) Gonzo$_i$ downloaded a picture of himself$_i$.

Similarly, in (27) the reflexive is in noncomplementary distribution with a pronoun and is treated as exempt from binding constraints:

(27) Gonzo$_i$ saw a snake near him$_i$/himself$_i$.

The binding theory of Reinhart and Reuland (1993) is similar in treating some anaphors as exempt. Recall that their Principle A requires a reflexive-marked syntactic predicate to be reflexive. Crucially, a syntactic predicate must have a subject. Therefore, although the noun *picture* in (27) is reflexive-marked, it does not count as a syntactic predicate, and Reinhart and Reuland's Principle A does not apply to it. Theories like these, in which some anaphors are exempt from binding constraints, contrast with approaches like that of Chomsky (1986), sketched earlier. In Chomsky's view, reflexives in examples like (27) are not exempt from binding but rather must be bound in a slightly larger syntactic domain. The binding theory of LFG is similar in this regard.

Constraints on the distribution of exempt anaphors are often claimed to be defined in nonsyntactic terms. For example, Pollard and Sag (1994) argued that exempt anaphors are used to refer to an antecedent whose point of view is being reported. In this view, exempt anaphors are subject to discourse and pragmatic constraints, as discussed extensively by Kuno (1987). In cases of noncomplementary distribution, such as (27), Kuno argued that the reflexive indicates that the speaker has taken on the subject's point of view but the pronoun does not. The encoding of point of view in pronominal systems is typically discussed under the rubric of logophoricity.

Theories of exemption differ on the treatment of the specifier or possessor of a noun phrase. Reinhart and Reuland's theory (1993), like Chomsky's (1986), treats specifiers of noun phrases as subjects for purposes of binding theory. This predicts that sentences like (28) are ungrammatical:

(28) * Gonzo$_i$ downloaded her picture of himself$_i$.

Since the specifier *her* is in the right structural position to count as a subject, the reflexive must be bound in the NP, either because it can be bound in this minimal domain (in Chomsky's 1986 account) or because the head noun counts as a syntactic predicate and is reflexive marked (in the Reinhart and Reuland account).

Recent psycholinguistic evidence has been shown to bear on this issue; speakers in fact find sentences like (28) grammatical (Asudeh and Keller, 2001; Runner *et al.*, 2003):

(29) Gonzo$_i$ downloaded her picture of himself$_i$.

Asudeh and Keller (2001) argued that the result exemplified by (29) supports predication-based binding theories that do not treat possessors as subjects, such as certain versions of HPSG and LFG binding theory. They noted that the possessor in the noun phrase is not an argument of the head noun and concluded that if the possessor is not a semantic argument, then it is not a subject in predication-based theories. In an HPSG binding theory, the reflexive in (29) is exempt. In an LFG account, the reflexive is not exempt but must be bound in the minimal domain containing a subject, which corresponds to the matrix clause.

Pragmatic and Blocking Approaches to Binding

In the binding theories reviewed thus far, Principle A and Principle B derive a kind of blocking effect: pronouns are in general barred where reflexives are

required. Pronouns and reflexives are thus predicted to be in mostly complementary distribution, although the complementarity is relaxed in certain situations, using a variety of mechanisms. Kiparsky (2002) noted that this derivative notion of blocking has the conceptual disadvantage of lacking deep motivation: the general complementarity seems merely coincidental. He argued that the grammar should include blocking principles that explicitly compare structures containing pronouns to ones containing reflexives. He gave an overview of the issues involved and offered a hybrid binding theory that includes blocking principles.

Huang (2000) presented an alternative sort of blocking account based on a theory of neo-Gricean pragmatics. Huang's analysis followed in an established tradition of pragmatic approaches to binding, which he reviewed extensively. His account contrasts with that of Kiparsky (2002), in which the blocking constraints rely on notions of featural and morphological economy rather than on pragmatic principles.

Although blocking accounts arguably provide an explanation of pronoun/reflexive complementarity that nonblocking accounts lack, they are by the same token seriously challenged when the complementarity breaks down. Reflexives and pronouns must be shown to give rise to different meanings or pragmatic effects in such environments, with the result that the blocking relation fails to apply since it chooses only between semantically or pragmatically equivalent options (Kiparsky, 2002; Huang, 2000).

Reflexives and Valence Reduction

Reflexive forms do not always fill a syntactic and semantic role of a predicate. In many languages, the same form can play two roles. It can be a reflexive pronoun with an independent syntactic and semantic role in some cases, and it can mark intransitivity or valence reduction, with no associated semantic role, in other cases. For example, the Swedish form *sig* serves as an argument long-distance reflexive in (30a). However, in (30b) it simply marks the verb as intransitive. Examples (30c) and (30d) show that the verb is intransitive, since the verb cannot take a full local reflexive or a free object.

(30a) Johan$_i$ hörde oss prata om sig$_i$.
J. heard us talk about self
'Johan heard us talk about him.'

(30b) Johan skyndade sig.
J. hurried self
'Johan hurried up.'

(30c) * Johan$_i$ skyndade sig själv$_i$.
J. hurried self

(30d) * Johan skyndade Maria.
J. hurried M.

A question raised by this pattern of data is why the long-distance reflexive is used for valence reduction. Reinhart and Reuland (1993) offered an explanation of these facts based on the observation that long-distance reflexives are morphologically simple (Faltz, 1977; Pica, 1987). However, in languages like English, which lack morphologically simple reflexives, full reflexives seem to serve a similar function:

(31a) Gonzo behaved himself.
(31b) * Gonzo behaved David.

A detailed study of reflexivization and its relation to syntactic and semantic valence reduction was presented by Sells *et al.* (1987).

Binding and Movement

Binding theory is invoked in certain treatments of A-movement (movement to an argument position) and A-bar movement (movement to a nonargument position) in transformational grammar. Such treatments assume that the passive example of A-movement in (32a) and the *wh*-question example of A-bar movement in (32b) involve transformations, in which the *t* represents the original position – the trace – of the coindexed element:

(32a) Gonzo$_i$ was accosted t_i.
(32b) Who$_i$ did someone accost t_i?

The fact that binding theory applies to these examples might initially appear puzzling since binding theory is about anaphors, pronominals, and nonpronouns, and traces do not seem to fit into any of these categories. However, Chomsky (1982) gave a featural breakdown of overt noun phrases in terms of the features [± a(naphor)] and [± p(ronominal)] and then applied the classification to covert noun phrases, i.e., empty categories. The passive trace is grouped with anaphors using the feature assignment [+ a, −p]. The trace in *wh*-movement is grouped with nonpronouns using the feature assignment [−a, −p]. This classification enables the statement of locality relations on transformations in terms of binding requirements on traces of moved elements.

The binding-theoretic treatment of empty categories has been considerably revised in more recent transformational work. Hornstein (2001) revived the connection by claiming that anaphors are the result of overt A-movement. In this view, pronominals and reflexives are both claimed to be grammatical formatives introduced during derivations, not by lexical insertion. This treatment of binding has the

advantage for transformational grammar of reducing binding to movement, which is independently motivated in transformational theory. However, it faces a number of challenges. The account does not readily extend to long-distance, intransitivizing, or exempt/logophoric reflexives. In addition, it treats deictic pronouns differently from anaphors and pronominals, as lexical items introduced through lexical insertion. This raises the question of why nondeictic personal pronouns, which are purely grammatical formatives, uniformly have the same morphological realization as deictic personal pronouns.

Despite these challenges, further evidence for binding as movement apparently comes from resumptive pronouns, as in the following Swedish example:

(33) Vilken elev trodde Maria att han fuskade?
which student thought M. that he cheated?
'Which student did Maria think cheated?'

This example seems to indicate that *wh*-movement has left a pronoun in the extraction site. This could be explained by treating resumptive pronouns as overt traces that result from a last-resort attempt to save a derivation. Boeckx (2003) offered an alternative movement-based account in which a resumptive pronoun is the result of spelling out a head whose complement has moved away to become the resumptive's antecedent. However, resumptive pronouns do not obey standard constraints on movement and do not possess other characteristics of *wh*-traces. They therefore do not lend straightforward support to the binding-as-movement view. In a recent overview of resumption, Asudeh (2004) argued that resumptive pronouns are not last-resort grammatical devices, overt traces, or the result of movement but are rather ordinary, lexically inserted pronouns that are bound by the *wh*-phrase and whose distribution is explained on the basis of semantic composition.

Lastly, binding is also relevant to movement as a diagnostic tool for the extraction site for movement. Reconstruction, as in (34a), and connectivity, as in (34b), are two particular phenomena in which binding has been crucial:

(34a) Which picture of himself$_i$ does nobody$_i$ like$_i$?
(34b) What nobody$_i$ was was sure of himself$_i$.

The locality of reflexive binding has been used as evidence that the *wh*-phrase in (34a) must be reconstructed in its base position. Similarly, the free relative's subject in its surface position in (34b) does not command, and therefore cannot bind, the reflexive. In order to bind the reflexive, the free relative's subject must at some nonsurface level be the subject of the second copula. Büring (2004: chapter 12) gave an extensive overview of reconstruction and connectivity, as well as other issues concerning binding and movement.

Biosemiotics

S Brier, Copenhagen Business School, Copenhagen, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Semiotics develops a general theory of all possible kinds of signs, their modes of signification and information, whole behavior and properties, but is usually restricted to human communication and culture. Biosemiotics (*bios*, life and *semion*, sign) is a growing field that studies the production, action, and interpretation of signs, such as sounds, objects, smells, and movements, as well as signs on molecular scales, in an attempt to integrate the findings of biology and semiotics to form a new view of life and meaning as immanent features of the natural world. Life and semiosis are seen as coexisting. The biology of recognition, memory, categorization, mimicry, learning, and communication are of interest for biosemiotic research, together with the analysis of the application of the tools and notions of semiotics such as interpretation, semiosis, types of sign, and meaning. The biosemiotic doctrine accepts nonconsciously intentional signs in humans, nonintentional signs, also between animals as well as between animals and humans, and signs between organs and cells in the body and between cells in the body or in nature. Thus the biological processes between and within living beings transcend the conceptual foundation of the other natural sciences.

In the tradition of Peirce, who founded semiotics as a logic and scientific study of dynamic sign action in human and nonhuman nature, biosemiotics attempts to use semiotic concepts to answer questions about the biologic and evolutionary emergence of meaning, intentionality, and a psychic world. Peircian biosemiotics builds on Peirce's unique triadic concept of semiosis, where the 'interpretant' is the sign concept in the organism that makes it see/recognize something as an object. This is its interpretation of what the outer sign vehicle stands for in a motivated context by relating to a code that is connected to that specific functionality. For instance, why a small gazelle, and not an elephant, is seen as prey for a cheetah. As Peirce's semiotics is the only one that deals systematically with nonintentional signs of the body and of nature at large, and therefore accepts involuntary body movements (such as instinctive motor patterns in animal courtship) and patterns of and within the body (such as plumage for another bird and smallpox for a physician) as signs, and further patterns and differences in nature (such as the track of a tornado), it has become the main source for semiotic contemplations of the similarities and differences of signs of inorganic nature, signs of the living systems,

Semiotics develops a general theory of all possible kinds of signs, their modes of signification and information, whole behavior and properties, but is usually restricted to human communication and culture. Biosemiotics (*bios*, life and *semion*, sign) is a growing field that studies the production, action, and interpretation of signs, such as sounds, objects, smells, and movements, as well as signs on molecular scales, in an attempt to integrate the findings of biology and semiotics to form a new view of life and meaning as immanent features of the natural world. Life and semiosis are seen as coexisting. The biology of recognition, memory, categorization, mimicry, learning, and communication are of interest for biosemiotic research, together with the analysis of the application of the tools and notions of semiotics such as interpretation, semiosis, types of sign, and meaning. The biosemiotic doctrine accepts nonconsciously intentional signs in humans, nonintentional signs, also between animals as well as between animals and humans, and signs between organs and cells in the body and between cells in the body or in nature. Thus the biological processes between and within living beings transcend the conceptual foundation of the other natural sciences.

In the tradition of Peirce, who founded semiotics as a logic and scientific study of dynamic sign action in human and nonhuman nature, biosemiotics attempts to use semiotic concepts to answer questions about the biologic and evolutionary emergence of meaning, intentionality, and a psychic world. Peircian biosemiotics builds on Peirce's unique triadic concept of semiosis, where the 'interpretant' is the sign concept in the organism that makes it see/recognize something as an object. This is its interpretation of what the outer sign vehicle stands for in a motivated context by relating to a code that is connected to that specific functionality. For instance, why a small gazelle, and not an elephant, is seen as prey for a cheetah. As Peirce's semiotics is the only one that deals systematically with nonintentional signs of the body and of nature at large, and therefore accepts involuntary body movements (such as instinctive motor patterns in animal courtship) and patterns of and within the body (such as plumage for another bird and smallpox for a physician) as signs, and further patterns and differences in nature (such as the track of a tornado), it has become the main source for semiotic contemplations of the similarities and differences of signs of inorganic nature, signs of the living systems,

and the cultural and linguistic signs of humans living together in a society.

Semiotics is also defined as the study – or doctrine – of signs and sign systems, where sign systems are most often understood as codes. Examples of biological codes are those for the production of proteins from the information of the genome, for the reception and effects of hormones, and neurotransmitters spring to mind as obvious biological sign systems. Marcello Barbieri (2001) has pointed to the importance of codes in living systems such as the genetic code, signal codes for hormones and between nerve cells, and between nerve cells and muscles, codes for recognition of foreign substances and life form in the immune system, etc. He defines codes as rules of correspondence between two independent worlds such as the Morse code standing for letters in the alphabet. A code gives meaning to differences or information in certain contexts. But information is not a code in itself. He also points to the peculiar fact that the proteins in the living cell are different from proteins created through external spontaneous chemical processes. Living systems are not natural in the same way as physical and chemical systems because the protein molecules they are self-constructed from are manufactured by molecular machines (the ribosomes and connected processes). The ribosomes, that is an organelle in the cell constructed by huge RNA molecules connected with several enzymes, are systems that are capable of assembling molecules by binding their subunits together in the order provided by a template. Cell proteins have the sequences of their amino acids determined by the internal code system in the cell connected to the genes in the nucleus's DNA. The ribosomal system for building proteins uses the base sequence of messenger-RNA, which comes out to the ribosome from inside the nucleus, in itself a template of the gene in the DNA, to determine the amino acid sequence in the proteins. Living systems are thus built out of artificially produced, code-based molecules from the cell's molecular assembler machine. They are autopoietic (self-creating) – as pointed out by Maturana and Varela – as they produce their own elements and internal organization. A living system's structure, organization, and processes are determined by internal codes and they are therefore in a certain way artificial.

Thus a code is a set of process rules or habits (for instance, how the ribosome works) that connects elements in one area (e.g., genes) with another area (e.g., proteins) in a specific meaning context (here the creation, function, and survival of the cell). As the biosemiotician Kalevi Kull (1999) points out, codes are correspondences that cannot be inferred directly from natural laws. To most biosemioticians, it is crucial that the correspondence is not a universal natural law but is motivated from a living signifying system. Thus machines do not make codes themselves. A sequence of differences such as the base pairs in DNA can be information for coding, but is not a code in itself. Biosemiotics argues that codes are triadic sign processes where an interpretant makes the motivated connection between objects and signs (representamens). Living systems function based on self-constructed codes. This differentiates them from physical, chemical, and technological systems (computers do not make their own codes as they function causally after the codes we have made and installed). As Alexis Sharov (1998) notes, a sign is an object that is a part of some self-reproducing system. A sign is always useful for the system and its value can be determined by its contribution to the reproductive value of the entire system. Thus semiosis is a crucial part of those processes that make systems living and lift them out of the physical world's efficient causality through the informational realm of formal causality in chemistry into the final causation in semiotic processes. Thus, biosemiotics works with more types of causation than classical sciences inspired by Peirce's semiotic philosophy.

In Peirce's philosophy, efficient causality works through the transfer of energy and is quantitatively measurable. Formal causality works through pattern fitting, difference, and with signals as information in a dualistic proto-semiotic matter. Final causation is semiotic signification and interpretation. Semiosis, both in the form of signification and communication, is viewed as an important part of what makes living systems transcend pure physical, chemical, and even the informational explanations of how computers function. Molecules are composed of sequences of atoms and make three-dimensional shapes. They interact informationally through formal causality. The biological macromolecules are composed of minor molecules often put in sequences. Cells interpret the molecules as coded signs and interact with them through final causation in semiosis.

Thus far, biosemiotics considers the living cell to be simplest system possessing real semiotic competence. Biosemiotics sees the evolution of life and the evolution of semiotic systems as two aspects of the same process. The scientific approach to the origin and evolution of life has overlooked the inner qualitative aspects of sign action, leading to a reduced picture of causality. The evolution of life is not only based on physical, chemical, and even informational processes, but also on the development of semiotic possibilities, or semiotic freedom as one of the founding biosemioticians, Jesper Hoffmeyer (1996), calls it. It is the evolution of semiotic freedom that creates the

Figure 1 The model classifies types of semiosis and proto-semiotic (informational) processes. On the left side is Luhmann theory of viewing the body, the psyche, and the linguistic system as autopoietic (closed and self-organized). The localization of the processes in this diagram is symbolic and not really related to actual physical locations; for example, the head is also part of biological autopoiesis and the location of endosemiotic processes. To simplify this model, I have placed all the cybernetic-autopoietic concepts on the left and all the biosemiotic ones on the right, although all concepts concern both persons. Each person is placed within a signification sphere (*Umwelt*). When these spheres are combined through sociocommunicative autopoietic language games, a common signification sphere of culture is created. One part of exosemiotic signification is based on the linguistic processes of conceptualization and classifications. Underneath the language games is the biological level of instinctually based sign games, and under that is the informational exchange through structural couplings. Thus, exosemiotics also has a level of biopsychological, or emphatic, signification, as well as a level of structural couplings that the organism, or rather the species, has developed through evolution. Endosemiotics is made up of the processes between cells and organs in the body. Phenosemiotics is prelinguistic sign processes in the mind such as emotions and imaging, where thought semiosis is conceptualized thinking. On the far left side are the signification processes toward the environment that consists of nonintentional potential signs that become the signification sphere when they are interpreted as signs.

zoosemiotic system of sign games, as the bio- and cybersemiotician Søren Brier (1995) calls it. These sign games are the primary system behind the foundation of human language games and the tertiary system of culture such as Thomas Sebeok and Marcel Danesi (2000) have thoroughly shown in their Modeling System Theory.

Multicellular living individual beings are then understood as swarms of communicatively organized semiotic cellular units. The human body is seen as organized in swarms of swarms of biological and as layer upon layer of internal (endo) semiotic processes, as well as external (exo) signification processes building up a signification sphere (*Umwelt*) and finally exo-semiotic social processes between individuals constructing language and first-person experiences (see Figure 1).

Complex self-organized living systems are not only governed by physically efficient causation; they are also governed by formal and final causality. They are governed by formal causality in the sense of the downward causation from a higher level structure (such as a tissue, an organ, or the entire organism) to its individual cells, constraining their action, but also endowing them with functional meanings in relation to the entire metabolism (as systems science has shown). Organisms are governed by final causality in the sense that they tend to take habits and generate future interpretants of the present sign actions, as in learning. In this sense (Brier, 1998), biosemiotics draws upon the insights of fields such as systems theory, theoretical biology, and the physics of complex self-organized systems. As Sharov (1998) points out, biosemiotics can be viewed as a root of biology and semiotics rather than a branch of semiotics (in its conventional limit to human languages). As such, biosemiotics also represents a suggestion for a deeper foundation that can connect biology with the humanities in another way than sociobiology and evolutionary psychology do.

Biological systems are then understood as being held together for communicative reasons and are therefore not natural in physical–chemical understanding. They are communicative structures, as Kull (2001) argues. One could also call them discursive material systems. As we can call humans language-cyborgs because our minds are artificially formed by language, we can call all other living systems sign-cyborgs because they are made of coded molecules and organized communicatively by semiotic processes. But computers only work on and are organized around differences or informational bits. Thus, they are dualistic and therefore proto-semiotic (Nöth, 2002), as genuine semiosis is triadic according to Peirce. The same goes for information in natural systems, for example dissipative structures such as tornadoes.

Biosemiotics offers a rich field of exploration and ongoing research into the life of signs as they are found in the actual world's ecological, mental, and artificial systems (Emmeche, 1998). Examples of relevant topics are sign functions in physical, chemical, biological, and computational systems such as molecular biology, cognitive ethology, cognitive science, robotics, and neurobiology; communication of all living systems including the area of ethology; the semiotics of cellular communication in the body among organs, the immune system, and in the brain such as psychoneuroimmunology, the representational dynamics of disease and possible relevance for medical diagnose and treatment; the study of the semiotics of complex systems, anticipatory systems, artificial life, and real life; the semiotics of collective biological phenomena such as emergent signs in swarm intelligence; the metaphysics of Darwinism: can semiotics provide a foundation for a new evolutionary paradigm through Peirce's idea of Thirdness, and the emergence of interpretants in biotic evolution? Biosemiotics can help develop the theory of biological self and its relation to the emotional and sign-producing systems in animals as well as the linguistic thinking system in humans, the theory of the embodiment of consciousness and language and internal mental causation. Such may be a short and bold formulation of the biosemiotic view combining several researchers' contribution to a view that is as close to consensus as possible for the leading researchers in this still young research program.

Apart from C. S. Peirce, early pioneers of biosemiotics are Jakob von Uexküll (1864–1944), Charles Morris (1901–1979), Heini Hediger (1908–1992), and Giorgio Prodi (1928–1987); the founding fathers are Thomas A. Sebeok (1920–2001) and Thure von Uexküll (1908–2004), and the founders of the second wave are contemporary scholars such as Jesper Hoffmeyer and Claus Emmeche (who formed the biosemiotic group in Copenhagen in the 1980s), Kalevi Kull (the Jakob von Uexküll center), Alexei Sharov, Søren Brier, Marcello Barbieri, Anton Markos, Dario Martinelli (zoosemiotic musicology), and semioticians such as Floyd Merrell, John Deely, Myrdene Anderson, Lucia Santaella, Frederik Stjernfelt, Tommi Vehkavaara, and Winfried Nöth have also contributed as part of their more general work. In the following, we look into the foundations and specific theories. However, it is interesting that F. S. Rothschild (1899–1995), who did not notably influence the development of biosemiotics, was the first to use the term in 1962 in the *Annals of the New York Academy of Sciences* 96: 774–784.

Thomas Sebeok's Development of Zoosemiotics and Biosemiotics

Ever since Umberto Eco formulated the problem of the semiotic threshold, Peircian semiotics has developed further into the realm of biology. The efforts of Thomas Sebeok (1920–2001) have led to the development of a biosemiotics encompassing all living systems, including plants and microorganisms as sign users (Petrilli and Ponzio, 2001). Sebeok's name is associated most of all with the term 'zoosemiotics,' the study of animal sign use (Sebeok, 1972). It was coined in 1963 and it deals with species-specific communication systems and their signifying behaviour. Zoosemiotics is concerned more with the synchronic perspective than the ethology of Lorenz and Tinbergen, which focuses more on the diachronic dimension. Sebeok's research succeeded in broadening the definition of semiotics beyond human language and culture to a biosemiotics encompassing not only human nonverbal communication but also all sign processes between and within animals (Sebeok, 1990). He pointed out that we are living in a world of signs: a 'semiossphere.' Sebeok argued that the biosphere and the semiossphere are linked in a closed cybernetic loop where meaning itself powers creation in self-excited circuits. With Sebeok's enthusiastic support as editor, the two large special volumes of *Semiotica* on biosemiotics (Sebeok *et al.*, 1999), and on Jakob von Uexküll's contribution to the foundation of biosemiotics (Kull, 2001) were edited by first the Copenhagen and next the Tartu school of biosemiotics. Later, through the collaboration of these schools of biosemiotics, a series of annual conferences under the name Gatherings in Biosemiotics has been developed since 2000, now also in collaboration with biosemioticians in Prague. In 2004, through further cooperation with the Italian school

of semantic biology (Barbieri), work on starting a *Journal of Biosemiotics* has begun.

Hoffmeyer and Emmeche's Theory of Code Duality

Later Sebeok decided that that zoosemiotics rests on a more comprehensive science of biosemiotics. This global conception of semiotics, namely biosemiotics, equates life with sign interpretation and communication. It is carried by an inspiration from Jakob von Uexküll's theory that all living beings are the center of a phenomenal *Umwelt* (Sebeok, 1989). This idea was carried on through Thure von Uexküll, with whom Sebeok interacted in creating the foundations for a modern biosemiotics. In the late 1980s, these ideas merged with the ideas of the Danish biochemist Jesper Hoffmeyer's communicative view of life and his and the biophilosopher Claus Emmeche's theory (Emmeche and Hoffmeyer, 1991; Hoffmeyer and Emmeche, 1991) of the foundational code duality of living systems: they see living systems defined by the interactions through evolution between a digital code in the gene or genotype and an analog code in the whole individual or phenotype. The gene is a code for memory and self-representation and the individual living body is a code for action and interaction with the real world and its ecology. Thus life appears also to be an interplay of different types of self- and other-descriptions. The egg and the hen as two interacting aspects of a living system evolving through time and space is another example. Thus signs and not molecules are the basic units of the study of life and the semiotic niche is the species home. Biological evolution is a development toward more semiotic freedom. Hoffmeyer's contribution to biosemiotics is summarized in Emmeche *et al*. (2002).

The Roots from Uexküll and Ethology

Although biosemiotics is already prefigured in Jakob von Uexküll's *Umweltlehre*, although not in semiotic terms, Sebeok fruitfully combined the influences of von Uexküll and Charles S. Peirce, to merge them into an original whole, in an evolutionary perspective, arriving at the thesis that symbiosis and semiosis are one and the same (Sebeok, 1989). Biosemiotics finds its place as a master science, which encompasses the parallel disciplines of ethology and comparative psychology. As Uexkull was one of Konrad Lorenz's most important teachers, the ethology he and Tinbergen developed fitted nicely into biosemiotics as it developed from Sebeok's studies of animal communication and ethology.

Figure 2 Jakob von Uexküll's functional circle that demonstrates his (phenomenal constructivistic) concept of objects (von Uexküll 1957: 10–11; referred to as 'Figure 3.') In cybernetic recursive e processes between receptors and effectors, the perceptual object is created on the basis of a functional tone.

In J. and T. von Uexküll's writings (J. von Uexküll, 1934; T. von Uexküll *et al*., 1982) on the species-specific and subjective *Umwelt* in animals, one finds the roots of important concepts such as sign stimuli, innate release mechanisms, and 'functional tones' that are later utilized in Lorenz's ethological research program as the concept of motivation. J. von Uexküll's 'tone' concept is the root of Lorenz's specific motivation, but it seems even more closely related to Gibson's affordances, although it is unclear whether Gibson ever read von Uexküll. The functional tones are the number of functions an animal can distinguish in its surroundings, which creates its functional images of 'thing' that thus becomes 'object' in the animals *Umwelt*. Brier (1999) has coined the term 'signification sphere' to give a modern semiotic term to Uexküll's presemiotic concepts. Figure 2 shows the presemiotic Uexküll model of object perception.

As von Uexküll's concept of 'tone' becomes Lorenz's 'motivation,' the 'subjectively defined object' becomes the 'sign stimuli' in ethology, and finally the 'functional relation between receptors and effectors' becomes the 'IRM' (innate response mechanism). However, it is clear that von Uexküll's biophenomenological concepts differ from the biocybernetic and partially mechanistic framework found in the theoretical foundation of Lorenz and Tinbergen's articles from around 1950. First in the new biosemiotics, this conceptual difference can be solved using Peirce's philosophy (Brier, 2001).

Animal Languages or Sign Games?

The empiricist and natural science readings Sebeok offers for communication were new to the semiotics field. References to animal models are made throughout his work in the context of ethology. The approaches of ethology and sociobiology have been controversial and, in their applicability to human culture and society, accused of reductionism. Sebeok shows that some of this controversy may find itself

played out in the new transdisciplinary framework of biosemiotics. In 1992, he and his wife Jean Umiker-Sebeok published 'The semiotic web 1991' as a volume titled *Biosemiotics*. This volume was predicated on a book they edited in 1980, *Speaking of apes*, which presented a detailed critical evaluation of current investigations of the ability of apes to learn language. Sebeok showed in a profound critique of the way the experiments were constructed that it is very doubtful that apes have such capabilities. Thus biosemiotics does not entail that there are no significant differences between human and ape linguistic capabilities. But through biosemiotics, Sebeok and Danesi (2000) argued that a zoosemiotic system exists as the foundation of human language, which has to be called the primary one; thus languages become secondary and culture tertiary, as already mentioned.

Anthroposemiotics as Part of Biosemiotics

But biosemiotics does not only deal with animals in zoosemiotics; it also deals with signs in plants in phytosemiotics, with bacterial communication. According to one standard scheme for the broad classification of organisms, five super kingdoms are now distinguished: bacteria, protists (protozoa-like slime molds and primitive algae, all with a nucleus), plants; animals; and fungi. Thus the major classification categories in biosemiotics are: bacteriosemiotics, protistosemiotics, phytosemiotics (Krampen, 1981), mycosemiotics, and zoosemiotics (Deely, 1990). Within zoosemiotics, anthroposemiotics encompasses the human race. There are two biosemiotic interpretations of anthroposemiotics. One is that it encompasses the traditional area of semiotics of language and culture plus the embodiment of human signification. The other one, that leading biosemioticians share, is that it only deals with the human body and the biological parts of human cognition and communication. Going into the body of multicellular organisms, *endosemiotics* (T. von Uexküll *et al.*, 1993) deals with communication between the cells in the body of all living systems, including human physiology. In the framework of endosemiotics, there is, for instance, a special area of immunosemiotics dealing with the immunological code, immunological memory, and recognition. The way that we now know that the nervous system's, the hormone system's, and the immunological system's communicative codes work on each other is considered to be the basis of the biological self: an endosemiotic self-organized cybernetic system with a homeostasis.

The Peircian Influence

The majority of biosemiotics builds on Peirce's unique triadic concept of semiosis, where the interpretant is the sign concept in the organism's mind, which is the interpretation of what the outer sign vehicle stands for: its object. For instance, that a raised fist's object is a physical threat. Peircean biosemiotics is based on Peirce's theory of mind as a basic part of reality (in Firstness) existing in the material aspect of reality (in secondness) as the inner aspect of matter manifesting itself as awareness and experience in animals and finally as consciousness in humans. Peirce's differentiation between the immediate object of semiosis and the dynamic object – that is all we can get to know about it in time – is a differentiation between the object of the organism and the environment or universe outside it. Biosemiotics begins with the process of knowledge: how signification occurs within living systems, making perception and cognition possible.

Peircian Biosemiotics

Modern Peircian biosemiotics is very different from the symbolic semiotics of human language that cyberneticians distanced themselves from many years ago. The theories of Heinz von Foerster on recursive functions in the nervous system establishing perceptual objects as eigen functions of this recursive cognitive interplay between nervous system and environment has supported Uexküll's older concept of object (Brier, 1996). Humberto Maturana and Francisco Varela's concept and theory of autopoiesis, the cell as a self- and closure-organizing system recursively reproducing the closure and internal organization of living systems, have had a significant influence on the development of the Copenhagen school of biosemiotics (Brier, 1995). The interaction between the autopoiesis, the genome, and semiosis in an animal (here a small fish) as understood through biosemiotics can be modeled as shown in **Figure 3**.

Peircian biosemiotics is distinct from other semiotic paradigms in that it not only deals with intentional signs of communication, but also encompasses non-intentional signs such as symptoms of the body and patterns of an inanimate nature. Peircian semiotics breaks with the traditional dualistic epistemological problem of first-order science by framing its basic concept of cognition, signification, within a triadic semiotic philosophy. Triadic semiotics is integrated into a theory of continuity between mind and matter (Synechism) where the three basic categories (Firstness, Secondness, and Thirdness) are not only inside the perceiver's mind, but also in the nature

Figure 3 Brier's model showing two autopoietic systems (males) of the same species (gene pool) see the same sign in an object, creating the interpretant of a female of the same species. This occurs through the partially inherited structural coupling that ethology calls the innate response mechanism (IRM), which is tuned to anticipate certain differences as significant for survival and proliferation, i.e., as sign stimuli. The whole model is within one life form (naturalizing Wittgenstein's concept), mating, which again generates the mating sign game or ground (Peirce). I have excluded here, for simplicity, the female's point of view as a species-specific autopoietic system.

perceived. This is connected to the second important ontological belief in Peirce's philosophy, namely Thycism that sees chance and chaos as basic characteristics of Firstness. This is combined with an evolutionary theory of mind (Agapism), where mind has a tendency to form habits in nature. Chaos and chance are seen as a First, which is not to be explained further (for instance, by regularities). It is the basis of habit-forming and evolution. The chaos of Firstness is not seen as the lack of law, as it is in mechanicism and rationalism, but as something full of potential qualities to be manifested individually in Secondness and as general habits and knowledge in dynamic objects and semiosis in Thirdness. This is the deep foundation of Peirce's pragmaticism (Brier, 2003).

Biosemiotics and Information in Computer and Physiosemiotics

The essential question for the current debate about the possibility of a transdisciplinary information/signification science is whether the Percian biosemiotics can comprise uninterpreted natural objects, dissipative structures, and other spontaneous generations of order and patterns in nature as signs. These objects were previously described in physical–chemical terms. Now some adherents of the paninformational paradigm want to explain them in purely informational terms (Brier, 1992). From a Peircian point of view, these phenomena are proto-semiotic, or quasi-semiotic, when compared to the semiosis of living systems, because they are only displays of Secondness in the well-argued view of Winfred Nöth (2002). There is thus competition between the informational and the semiotic approaches in producing that new transdisciplinary framework that can unite the traditional views of nature by the sciences, with the new understandings of computers and cognition and finally the social aspects of language and consciousness in communication.

But some scholars even accept to use the sign concept on processes between nonliving entities in nature and machine: physiosemiotics. John Deely (1990) is one of the more prominent promoters of a Peircean view of semiotics as a transdisciplinary theory encompassing both the human mind and its text production as seen from phenomenology and hermeneutics as well as all of nature and life seen from a biosemiotic as well as a physiosemiotic viewpoint. That is not the discussion of whether any natural thing can become a sign when placed in a meaningful context by a living system, but if the objects and their processes are signs *per se*.

It is interesting to see that semiotics thus has moved from the humanities into biology and from there even into the other natural sciences at the same time as the

Figure 4 The relevance of the bottom-up informational view and the top-down semiotic view in the area of the foundation of information science. On the left side is a hierarchy of sciences and their objects, from physics to humanities and vice versa. On the right is an illustration of the two most common scientific schemas for understanding and predicting communicative and organizational behavior: (1) the semiotic top-down paradigm of signification, cognition, and communicative and (2) the informational bottom-up functionalistic view of organization, signal transmission, and AI. The width of the two paradigms in correlation with the various subject areas shows an estimate of how the relevance of the paradigm is generally considered, although both claim to encompass the entire spectrum.

formulation of objective informational concepts has been used as the basis of understanding all types of cognitive processes in animals, machines, humans, and organizations in the information processing paradigm. Information science is thus moving from computer science down into nature and up into cognitive systems, human intelligence, consciousness and social systems, and communication in competition with semiotics that is moving in the other direction (see Figure 4).

Information theory is now an important part of the consciousness research program, but there is a great deal of work to do for serious philosophy, considering how many central philosophical topics of mind, language, epistemology, and metaphysics will be affected by the biosemiotic development. Peircian biosemiotics may contribute to a new transdisciplinary framework in understanding knowledge, consciousness, meaning, and communication. But to do this, new elements have to be integrated, making it possible to unite the functionalistic approaches to information and communication coming from cybernetics and computer science with the semantic pragmatic approaches coming from the linguistic point of view and semiotics if we want to bridge this gap in our culture and knowledge. Concepts of closure, self-organization, and differentiation of biological, psychological, and social systems developed in second-order cybernetics and autopoiesis theory need to be integrated into theories of embodiment and Peircian biosemiotics.

Cyber(bio)semiotics

Søren Brier (2003) has developed such a philosophy of information, cognition, and communication science framework that encompasses biosemiotics and information science and well as second-order cybernetics and autopoiesis to this transdisciplinary area, which he calls Cybersemiotics.

Peircean cybersemiotics is based on Peirce's theory of mind as a basic part of reality (in Firstness) existing in the material aspect of reality (in Secondness) as the inner aspect of matter (hylozoism) manifesting itself as awareness and experience in animals and finally as consciousness in humans. Combining this with a general systems theory of emergence, self-organization, and closure/autopoiesis, and a semiotized version of Luhmann's triple autopoietic theory of communication (see Figure 1) combined with pragmatic theories of embodied social meaning, it forms an explicit theory of how the inner world of an organism is constituted and, therefore, how first-person views are possible and are just as real as matter. Such a theory has been missing from the modern discussions of a science of consciousness. Through this foundation for semiosis, a theory of meaning and interpretation including mind – at least as immanent in nature – is possible, and cybernetic views of information as well as autopoietic views on structural couplings can be combined with pragmatic theories of language in the biosemiotic perspective.

The term 'pro- and quasi-semiotic objects' recognizes that systems in nature and culture work with differences, often in the form of coding, instead of through either physical causality or meaningful semiosis. Systems of Secondness have established an information level above the energetic and causal level of nature. This area, delimited from a semiotic point of view, is part of what classical first-order cybernetics considers their subject area: goal-oriented machines and pattern-forming, self-organized processes in nature that are based on information. The terms 'informational,' 'coding,' and 'signal' are used mainly in cybernetic contexts for these systems, before attempts, foreshadowed by Wiener, to create a

paninformational paradigm (Brier, 1992). In Peircean biosemiotic philosophy, these levels can be bound together by Synechism, Tychism, and Agapism, combined with an evolutionary view of the interactions between Firstness, Secondness, and Thirdness. The view of Firstness as a blend of qualities of mind and matter containing qualia and living feeling and a tendency to form habits is crucial for understanding the self-organizing capabilities of nature and how what seems to be dead matter can, through evolutionary self-organization, become autopoietic and alive with cognitive/semiotic and feeling abilities (Brier, 2003).

To summarize, cybersemiotics develops a semiotic and informational theory accepting several levels of existence, such as a physical and a conscious social linguistics, now placed in the broader cybersemiotics framework that combines Peirce's triadic semiotics with systemic and cybernetic views including autopoiesis and second-order cybernetics. When talking about reality, I think we should distinguish between:

1. The first level of quantum vacuum fields entangled causality is not considered physically dead, as is usually the case in physicalistic physics. Cybersemiotics conceives it as a part of Firstness, which also holds qualia and pure feeling. Although physicists may be bothered by this new metaphysical understanding of this level of reality, they cannot claim that there is no room for new interpretations, because physics has a complete understanding of it. On the contrary, this is one of the most mysterious levels of reality we have encountered, and its implications and interaction with the observers' consciousness have been discussed since the 1930s and were central in the disputes between Bohr and Einstein, and now some researchers are attempting to exploit the entanglement to explain the possibility of teleportation.
2. The second level of efficient causation is clearly what Peirce describes as Secondness. This realm is ontologically dominated by physics as classical kinematics and thermodynamics. But for Peirce, it is also the willpower of the mind. It is mainly ruled by efficient causation. Thus Peircean cybersemiotics does not accept a level of pure mechanical physics; nor did Ilya Prigogine.
3. The third level of information is where the formal causation manifests clearly and where the regularities and Thirdness becomes crucial for interactions through stable patterns that are as yet only proto-semiotic. This level is ontologically dominated by the chemical sciences. This difference in ontological character may be one of the keys to understanding the differences between physics and chemistry. It is not only a matter of complexity but also of organization and type of predominant causality, which here is formal causation.
4. On the fourth level, where life has self-organized, the actual semiotic interactions emerge. First internally in multicellular organisms, such as in endosemiotics, and between organisms such as in sign games. This framework – based on biosemiotics – points out that the informational concept may be useful for analyzing life at the chemical level, but it is not sufficient to capture the communicative, dynamic organizational closure of living systems. This is one of the reasons why Maturana and Varela do not want to use the information concept in their explanations of the dynamics of life and concept. But they do not use a semiotic either. Final causation dominates here as in the next level where it emerges as purpose.
5. Finally on the fifth level with syntactic language games, human self-consciousness emerges and with that rationality, logical thinking, and creative inferences (intelligence). Intelligence is closely connected to abduction and conscious finality. Abduction is crucial to signification. It is the ability to see something as a sign for something else. This something else has to be a habit of nature, mind or society. Some kind of regularity or stability in nature that the mind can recognize as somewhat lawful is necessary for it to be a fairly stable eigen value in the mind (an interpretant) and be useful for conscious purposeful action and interaction in communication as well as in ethical social praxis (Phronesis).

Birdsong: a Key Model in Animal Communication

M Naguib, Universitat Bielefeld, Bielefeld, Germany
K Riebel, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The melodious beauty and complexity of birdsong have long attracted amateurs, naturalists, and scientists alike. Despite the almost ubiquitous presence of birdsong in both natural and anthropogenous environments, few people are aware that birdsong is one of the most elaborate acoustic communication systems in the animal kingdom. Birdsong shows some basic and almost unique similarities to human speech, an aspect that has attracted considerable interdisciplinary scientific attention from biologists, psychologists, and linguists. As in human speech acquisition, vocal learning by songbirds plays a prominent role in song development (Catchpole and Slater, 1995). There is a sensitive period in which the basic species-specific structure is acquired, in much

the same way that humans have to acquire the phonemes of their language in the first few years of life. The only other well-established examples of animal communication in which learning plays such a central role in signal acquisition are found in parrots, hummingbirds, bats, and marine mammals (Janik and Slater, 1997).

Using birdsong as a model system allows us to study the complexity of animal behavior from both mechanistic and functional perspectives. Because it is the best studied vertebrate communication system on almost all levels of scientific investigation, from molecular biology to evolutionary ecology, birdsong development has become a textbook example for illustrating basic biological processes (Alcock, 2001; Campbell and Reece, 2001; Barnard, 2004). In most songbirds that breed in the temperate zones, only the males sing; their songs function to defend a territory against other males and to attract and stimulate females (Catchpole and Slater, 1995), but there is an enormous variation in song structure and phenomenology, development, and delivery. The taxonomic order of perching birds (passerines) can be subdivided into two distinct groups: the oscines (over 4000 species), which in general learn their song, and the sub-oscines (about 1000 species), for which there is limited evidence that key structural components of the species-typical song are learned (Kroodsma, 2004). Many of the sub-oscines are tropical birds and their song is often much simpler than is the highly complex song common in oscine species. Songbirds in the tropics also differ from those in the temperate zones in how and when they sing: singing tends to occur all year round and often females also sing. Even more strikingly, mated pairs may combine their songs into highly coordinated duets (Hall, 2004). The speed and precision in coordination of timing of duets results in a composite signal that, even for an experienced human listener, sounds like the song of a single individual. This article will mainly focus on song by males in temperate zone passerines, as these are much better studied than tropical birds and are ideal to illustrate general principles of songbird vocal communication.

Birdsong versus Bird Calls

Birdsong is distinguished from the remainder of songbird vocalizations, which are generally referred to as calls. Calls have been defined based on both structural and functional criteria. Calls are given by both sexes, they are simple in structure, and in many cases they are highly context specific, such as begging calls or alarm calls (Marler, 2004). Other than song, which is normally delivered only in the breeding season, calling occurs all year. Calls have long been thought to be affected little, if at all, by vocal learning. However, with more studies addressing call learning, it has emerged that there is much more developmental plasticity than previously thought. Among the various calls given by birds, the alarm calls given in response to predators have received specific attention, because they can vary gradually with the urgency of the threat and even provide functionally referential information (*see* **Alarm Calls**), a trait that has long been viewed to be specific to human language.

Singing Versatility

Birdsong structure and versatility vary enormously, from structurally simple songs with only one repeated element (e.g., grasshopper warblers, *Locustella naevia*) to highly complex songs (e.g., nightingales, *Luscinia megarhynchos*) in which each male sings around 200 different song types, each of which is composed of many different elements (**Figure 1**). For the purpose of comparative studies, it has proved useful to categorize birds into continuous and discontinuous singers (Hartshorne, 1973; Catchpole and Slater, 1995). Continuous singers such as reed warblers (*Acrocephalus scirpaceus*) produce long, almost continuous streams of elements (the basic units of vocal production). The elements in the song repertoire of a continuous singer are usually recombined in various ways, so that each new sequence is slightly different from the previous ones. Most male songbirds, however, are discontinuous singers, i.e., they alternate songs (which are a specific combination of song elements) with silent intervals (**Figure 1**). Among different species of discontinuous singers, there are two discrete singing styles. In some species, males repeat the same song type several times before switching to a song of a different type. This way of singing is most characteristic for species in which males have a small to medium repertoire of different song types (i.e., a repertoire of 2 to 10 acoustically distinct songs/male). There are some exceptions to this rule, though; for example, Carolina wren (*Thryothorus ludovicianus*) males have a repertoire of about 40 distinctly different song types, but deliver their repertoire with eventual variety. Birds following this repetitive mode are generally said to be singing with 'eventual variety.' Examples are song sparrows (*Melospiza melodia*), yellowhammers (*Emberiza citrinella*), chaffinches (*Fringilla coelebs*), and great tits (*Parus major*). In other species, males hardly ever repeat the same song type in immediate succession but instead, after each song, switch to a different song type within their repertoire. This singing style is 'referred to as showing 'immediate variety' and is characteristic of species that have larger song repertoires, such as mockingbirds (*Mimus polyglottus*), European blackbirds (*Turdus merula*), or nightingales.

Figure 1 Sound spectrograms of 25-s singing sequences by males of five different species of songbirds. (A) Grasshopper warbler, *Locustella naevia*, (B) Carolina wren, *Thryothorus ludovicianus*, (C) song sparrow, *Melospiza melodia*, (D) yellowhammer, *Emberiza citrinella*, (E) nightingale, *Luscinia megarhynchos*; (B)–(D) show singers with eventual variety and (E) shows a species with immediate variety.

Song Development

Songbirds have an exceptional faculty for vocal learning (Figure 2). Song learning consists of a phase of acquisition (sensory phase: memorization of song patterns) and a phase of production learning, i.e., the sensorimotor learning phase of the complex motor pattern. The timing of these two processes during development varies across species, from tightly overlapping to completely separate in time. The acquisition process is often limited to a sensitive phase during the first year of life (which is the time to maturation in most songbird species), with no additional learning after the first breeding season ('closed-ended learners'; e.g., chaffinches or zebra finches (*Taeniopygia guttata*)). In other species, learning might continue throughout life ('open-ended learners'; e.g., canaries (*Serinus canaria*) or starlings (*Sturnus vulgaris*)). Often this entails repertoire size increasing with age.

Song acquisition learning seems to take place during a sensitive phase without apparent external reinforcement ('channeled' or 'pre-programmed' learning). Unlearned biases (varying in their specificity across species) guide what types of vocalizations are preferentially learned. Generally, the first auditory memories are laid down during the first weeks of life, often around the time when the young birds fledge from the nest, and the sensory learning phase precedes the motor learning phase. In seasonal species, this might not occur until months after the offspring heard adult birds sing. Early singing consists of quiet, amorphous warbling (subsong) that proceeds to more structured and phonologically varied song (plastic song). Whereas these first two phases may take several weeks, the last transition, to the fully crystallized song, often occurs rather rapidly, within a few days. After that, phonology, phonological syntax, and timing fully are those of adult song (Figures 3 and 4). The onset of motor practice and song crystallization correlates with changes in steroid hormone levels, which are triggered by photoperiod in temperate zones but exhibit less clear circannual patterns in tropical nonseasonal species. Where song

Figure 2 Culturally transmitted song types in the zebra finch (*Taeniopygia guttata*). Columns show spectrograms of tutors' songs in the top row (adult males w709 and o554, respectively) and their respective tutees. Young males were housed with their respective tutors throughout the sensitive phase for song learning (days 35–65 posthatching); as a result, songs of tutees resemble the song of their tutor and each other more than do those of full brothers.

Figure 3 An example of changes in one song motif in the course of ontogeny in a chaffinch, *Fringilla coelebs*. The crystallized song type was also in the final song type repertoire of this individual (illustrated in **Figure 4**, tutee song type 2).

and testosterone titers are seasonal, a brief phase of subsong is observed before the onset of the breeding season even in adult birds.

In the sensorimotor model of song learning, a crude early template sets the sensory predispositions that filter the types of acoustic stimuli that are laid down as specific song memories (the 'template') during the sensory learning phase. The template is adjusted by learning and plays an important role in the development of full song in the subsequent sensorimotor phase. This is in line with observations that song developed by young birds deprived of adult song tutors contains species-specific characteristics (a song-deprived nightingale sounds different from a song-deprived starling) but lacks the fine detail of normal adult song. With the onset of the motor learning phase, auditory feedback is crucial to adjust the song output until it matches the template. Interrupting the auditory feedback by masking it with noise or by blocking the central nervous connections, thus making the bird unable to hear its own song, will result in the development of song that is even more impoverished than the song of isolate-raised birds. The original model of song learning has been updated and altered over the years, but both behavioral and neurobiological findings seem to support the principle underlying ideas of a two-phase process (sensory and sensorimotor learning phases), and this still serves well as an appropriate description of the basic pattern observed in many species.

Consequences of vocal learning are increased interindividual and geographic variation arising from imprecise song copying (see individual w83 in **Figure 2** and differences between tutor's and tutee's songs in **Figure 4**). As in human speech, birds can have local dialects that are discretely different from

Figure 4 Four song types were played on tape to young fledgling chaffinches (tape tutor). The final repertoire of one of the respective tutees in the subsequent spring is shown (for song development, see **Figure 3**). Redrawn from Riebel K and Slater P J B (1999), *Ibis 141*, 680–683.

other dialects in the same species, with clear-cut dialect boundaries (*see* **Dialects in Birdsongs**). Population changes in time and space have been relatively well studied due to short avian generation times, and cultural changes in song can be easily observed and documented. Songbirds thus provide an important study system for nonhuman gene-culture co-evolution studies and diachronic and geographic change such as dialect formation.

Development of Vocalizations in Non-oscine Birds

In contrast to the extensive vocal learning process in most songbirds, their closest relatives, the sub-oscines, seem to be able to develop species-specific song even when deprived of adult song or auditory feedback, although vocal learning now also has been shown to occur in some sub-oscines. Vocal learning in songbirds seems to have evolved independently several times and has also been reported for at least two other avian orders, parrots (Psittacidae) and hummingbirds (Trochilidae). Vocal learning has been little investigated in other avian taxa and may be even more widespread than reported (Kroodsma, 2004). Developmental changes during maturation also occur in taxa not described as vocal learners. For example, specialized juvenile vocalizations (such as begging calls) may disappear from the vocal repertoire or the characteristics of the vocal tract may change during growth. An analogue to human 'voice breaking' has been described in a number of bird species. Even in bird species in which the sexes do not exhibit substantial morphological differences, adult males and females often show consistent differences in acoustic parameters such as fundamental frequencies and harmonic composition. These differences often seem to come about rather suddenly during sub-adult development and possibly coincide with steroid hormone-induced changes of the vocal tract (Ballintijn and ten Cate, 1997).

Song Production

Birds have a larynx located at the top of their trachea, but vocalize with the aid of a specialized organ, the syrinx, located much lower down where the two bronchi join to form the trachea (*see* **Vocal Production in Birds**). The tonal character of many bird vocalizations and the existence of a unique sound-producing organ have triggered a wealth of hypotheses as to possible fundamental differences in sound production mechanisms between birds and mammals. Recent findings suggest that the basic mechanism is the same: cyclic opening and closing of the gap between the vocal membranes lead to harmonic sound at the source, which undergoes filtering by the vocal tract. However, whereas a larynx consists of only one pair of vocal folds, there are two sets (one in each bronchus) of each of the several pairs of membranes involved in birdsong production (Goller and Larsen, 2002). The two halves of the syrinx are innervated

independently, creating two potential sound sources that can, within certain limits, be operated independently. In most songbirds, one side of the syrinx seems dominant over the other, and this lateral dominance might even differ from syllable to syllable and even within a syllable. As in mammal sound production, including human speech, the settings of the songbird vocal tract act as a vocal filter and movements of the neck, tongue, and beak contribute to changes in resonance properties.

Neurobiological Correlates of Singing and Song Learning

Songbird brains show special adaptations for the production and acquisition of song (Figure 5). A number of interconnected brain nuclei (the 'song system') are absent in non-vocal-learning bird species and are sexually dimorphic in those species in which producing song is a behavioral dimorphism. The brain areas involved are highly specialized and easy to distinguish from surrounding brain tissue using standard tissue staining techniques. Two main pathways are involved in sound production (Figure 5A). The posterior (or motor) pathway descends from cerebral areas to control the syrinx via the hypoglossal nerve (XII); two cerebral regions (HVC and RA; see Figure 5 for abbreviations) show neuronal activation synchronized with singing. The anterior pathway plays an important role in song learning, and lesions in either Area X or MAN in young birds disrupt song acquisition; such lesions do not affect singing in adult birds. The well-delineated sensitive phases of sensory learning in many songbird species allow controlled experimental assessment of the quantity and quality of the sensory input. Avian song learning is thus a prime model to study the neurobiological basis of vocal learning and adult neuronal plasticity (seasonal changes, neurogenesis). Insights from neurophysiology and anatomy and from studies on effects of differential gene expression mediating neuroanatomical and functional change have greatly advanced our understanding of the subtle neuroanatomical changes involved in learning (Jarvis, 2004).

Sex Differences

The avian song system has provided examples of the most extreme sex differences in functional brain anatomy in vertebrates documented so far. The pronounced sex difference related to song systems and the pronounced seasonal changes in neuronal number and volume (up to threefold) and of the song nuclei (Tramontin and Brenowitz, 2000) provide interesting insights into the role of steroid hormones in neuronal

Figure 5 Song system. Schematic drawings of a parasagittal section of the songbird brain. Abbreviations are based on the revised nomenclature of Reiner *et al.* (2004), *Journal of Comparative Neurology 473*, 377–414: CMM, caudal medial mesopallium (former: caudal medial hypertriatum ventrale, CMHV); DLM, medial part of the dorsolateral thalamus; HVC, high vocal center; L, Field L2; LaM, lamina mesopallialis (former: lamina hyperstriatica, LH); MAN, magnocellular nucleus of the anterior nidopallium; MLd, mesencephalic lateral dorsal nucleus (dashed lines indicate the nucleus is located more medially than the illustrated section); NCM, caudal medial nidopallium; nXIIth, nucleus hypoglossalis partis tracheosyringalis; Ov, nucleus ovoidalis; RA, magnocellular nucleus of the arcopallium; V, lateral ventricle. (A) Anterior and posterior pathway. Arrows connect nuclei of the conventional 'song system' that consists of the posterior (motor) pathway and the anterior forebrain pathway. Two main pathways are involved in sound production and learning; the posterior (motor) pathway is activated during singing and descends from the HVC (pallium): HVC → RA → nXIIts → syrinx. The anterior pathway, HVC → Area X → DLM → MAN → RA, is involved in vocal learning. (B) Auditory pathway: input from cochlea via auditory nerve (VIII) and brain stem nuclei (not shown) → MLd (mesencephalon) → OV (in the thalamus) → L (with primary and secondary auditory cells of the pallium) → tertiary auditory areas of the nidopallium (NCM, CMM, HVC shelf, and RA cup). From the HVC shelf there is also a descending pathway via the RA cup to the auditory regions of the midbrain. The gray areas show neuronal activation when the bird is exposed to conspecific song. Figure kindly provided by Terpstra N and Brittijn M (2004), *Journal of Neurosciences 24*, 4971–4977.

development and differentiation. Large differences between closely related species, ranging from species in which females have never been observed to sing to those in which females sing as much as males, provide excellent opportunities for comparative studies in neuroethology (Brenowitz, 1997; MacDougall-Shackleton and Ball, 1999). They also provide a prime model for the study of hormonal and genetic effects in gender differentiation. When song is sexually dimorphic, it is possible to differentiate production and perception learning and to identify specialized adaptations of the brain. In a cross-species comparison across 20 or so species, sex differences in the neuronal song system were found to be correlated with sex differences in song output and repertoire size (MacDougall-Shackleton and Ball, 1999). However, it is unclear whether this is due to sex differences in song output or to vocal learning. Most studies so far have been based on sex differences related to quantity and quality of adult song output and not to song learning (Gahr *et al.*, 1998). Though many species show clear sex differences in song usage, there have been few studies investigating female vocal learning abilities, but this is a rapidly growing field of research (Riebel, 2003). Evidence is quickly accumulating that early learning greatly influences adult female song and its perception. Future studies will thus have to show whether females differ from males in when and what they learn, or only in how much they sing.

Hearing and Perception

The Avian Ear and the Auditory Pathway

For any communication system, the study of physical properties of signals and their production needs to be paralleled by the study of the corresponding receptors. Bird ears are similar to mammal ears in many respects, but differ in a number of key features. The outer ear lacks an external pinna, and its opening in the skull is covered by feathers and there is only a single middle ear bone (the columella). Moreover, the basilar papilla is straight rather than coiled and shows a greater diversity of sensory hair cell types compared to mammal ears (Causey Whittow, 2000). These differences might explain why the range of audible frequencies seems little curtailed despite the remarkably short basilar papilla, which is only about 2–3 mm long (compared to up to 9 mm in owls and 30 mm in humans). Despite these differences, in general, birds' ears work like those of mammals. Sound waves set the membrane separating the inner from the outer ear vibrating. This motion is transmitted via the columella to the fluid of the inner ear. The pressure changes and motions within the fluid excite the hair cells on the sensory epithelium; the hair cells act as transducers, leading to sound-specific patterns of discharge in the auditory nerve (the (nVIIIth)). From nVIIIth, the auditory pathway (Figure 5B) continues, ascending via a number of nuclei in the brain stem, the mesencephalon, and the thalamus (ovoidalis) to primary and secondary auditory cells of the pallium. From there, auditory information is transmitted to tertiary auditory areas of the nidopallium. Thus, in line with songbirds' sensory learning abilities, there is a full ascending sensory pathway to higher forebrain regions.

Hearing Range and Perception

The hearing ranges of birds have been determined using both electrophysiological methods (recording neuronal activities on sound playback) and behavioral methods (training birds to indicate behaviorally whether they can discriminate between two sounds). Bird hearing is remarkably acute both in the low- and high-frequency ranges, despite the short basilar papilla. Audiograms show species-specific peaks and troughs, with specialists such as night-hunting owls showing higher sensitivities. Inspection of avian audibility curves reveals no ultra- or infrasonic hearing (Figure 6). Though birds might hear from roughly 0.5 to 10 kHz, they generally hear best between 1 and 6 kHz, with absolute sensitivity approaching 0–10 dB SPL at the most sensitive frequency, which is usually at around 2–3 kHz (Dooling, 2004). Generally, the sounds that birds produce map

Figure 6 Avian and human audibility curves. Owls (Strigiformes) have a higher sensitivity compared to an average songbird and to humans. Redrawn from Dooling R J *et al.* (2000), in Dooling R J, Fay R R, and Popper A N (eds.) *Comparative hearing: birds and reptiles*, 308–359, New York: Springer Verlag; and Dooling (2004).

well onto the frequency range of their most sensitive hearing.

Despite their small head size, songbirds also show good directional hearing. Instead of integrating the information of directionality using differential arrival times of a sound at both ears, songbirds' ears are connected via the air cavities in the skull bones so that sound is incident on the inner surface of the tympanic membrane at the opposite ear. Two different pressures build up on either side of the membranes; by moving its head until the two pressures are equalized, the bird localizes the sound. The magnitude of spatial masking release is similar to that in humans (10–15 dB, with tone and masking noise 90° apart). Masking effects of noise are frequency specific and strongest when overlapping with the actual signal (Klump, 1996). Compared to humans, birds do less well in detecting changes in intensity, but when discriminating between complex sounds, birds demonstrate fine temporal resolution, exceeding that of humans. However, birds' perception also shows some interesting parallels with human abilities, and there is good experimental evidence for auditory stream analysis (filtering of auditory objects from general background noise) and categorical perception (both for avian and non-avian vocalizations; i.e., birds show categorical perception of human phonemes). Birds also superficially show complex serial pattern recognition (for example, in the discrimination of musical tunes), but use different strategies for categorization than humans. Unlike humans, who focus on differences in relative pitch, in bird species tested so far, absolute pitch and absolute frequency range were more important in classification of complex sounds.

Development of Hearing and Perception The development of hearing and perception has not been widely studied, compared to song production. However, even in species not known as vocal learners, perception is modulated by experiences during development. In ducklings (*Anas platyrhynchos*), preferences for and recognition of the species-specific maternal call are greatly impaired in birds that are deprived of hearing their mother's and their own calls while still in the egg (Gottlieb, 1978). Development and learning are of even greater impact when complex vocalizations, such as the learned songs in songbirds, are concerned. During the sensorimotor learning phase, auditory neurons develop specific responsiveness to elements of, first, the tutor and, later, the bird's own song. Song discrimination abilities are impaired in both males and females if they are deprived of species-specific song during development, suggesting that the fine tuning of song perception also depends on early experiences in non-singing females. Moreover, evidence is accumulating that female preferences for specific variants of conspecific songs are also greatly influenced by social learning processes (Riebel, 2003).

Evolution and Functions of Birdsong

Functions of Birdsong

So far we have dealt with the proximate causation of song: its development, control and perception. But why do birds sing? And what kind of information do they signal and extract from a song that they hear? It is well documented that birdsong is an advertisement signal with a dual function: territory defense and mate attraction. However, the precise functions of song can differ among species. Moreover, within species, the function of song may differ with time of day or season and it may differ depending on how birds sing, i.e., which song patterns they sing and how they use them when interacting with each other. Song encodes information about the singer and such information can be relevant for other males and females. Nevertheless, females and males may attend to different aspects of song so that, even though song may be addressed to both sexes, the specific traits that are used to assess a singer may differ, depending on which sex is listening.

Birdsong as a Long-Range Signal

Unlike human speech, birdsong, in common with other advertisement signals in the animal kingdom, is used as a long-range signal, often over 100 or more meters. During transmission through the environment, acoustic signals inevitably attenuate and degrade (Wiley and Richards, 1982; Slabbekoorn, 2004) (Figure 7). Thus the structure of a song at the position at which a receiver makes a decision differs from its structure at its source. The nature of these environmentally induced changes in a song depends on habitat structure and weather conditions. The differences in the acoustic properties of a given habitat are of evolutionary significance, and certain signal structures will be more effective than others in long-range communication. As a consequence, songbirds in forests sing differently from those that live in open areas, such as woodlands or fields. The reflecting surfaces of the vegetation in forests are the main cause of sound degradation (signal reverberation); in contrast, open habitats cause negligible reverberation. Rapid repetitions of elements with the same frequency structure, i.e., trills, are particularly susceptible to being blurred by reverberation. Indeed, birds in closed habitats have been found to sing trills with slower repetition rates compared to birds in

Figure 7 Undegraded and degraded sound spectrograms and oscillograms of a chaffinch song. Upper panel: song as recorded from a singing male within a distance of 10 m is undegraded. Lower panel: song as recorded at a distance of 40 m in a deciduous forest. Here the oscillogram (top) and spectrogram (bottom) show temporal smearing of the sound.

open habitats. Because vegetation also causes additional attenuation of sound, and specifically of the higher frequencies, there should be strong selection to avoid higher frequencies for long-range communication in forests. Empirical findings show that birds in open habitats use, on average, more high frequencies than do birds in closed habitats. However, the environmental effects on song transmission not only mask information coded in the song but also provide additional relevant information. Degradation and attenuation with distance are to some extent predictable, so that birds, like humans, have been shown to use cues from degradation and attenuation as distance cues (Figure 8). This can be crucial for an effective defense of large territories against rival males (Naguib and Wiley, 2001). Because they can assess the distance to a singing rival, males need only invest time and energy in repelling a rival that is nearby and therefore is a likely threat; energy need not be wasted when the rival is far away and beyond the territorial boundary.

Figure 8 Response scores of Carolina wrens to playback of undegraded (clear) song and song with added distance cues. Scores on the principal component (shown on the *Y* axis) indicate strength of response. Birds, like humans, use reverberation and high-frequency attenuation as separate cues to distance. Reproduced from Naguib M (1995), *Animal Behaviour 50*, 1297–1307.

Territorial Function and Communication among Males

Song in most passerine birds is used as a territorial signal, i.e., to advertise an area that will be defended against rival males. In a classic study on the territorial function of birdsong, Krebs and colleagues (Krebs, 1977) removed male great tits from their territories; installed loudspeakers then played recorded conspecific song or a control sound, or no sound was broadcast (Figure 9). Territories in which no song or the control song (a tune on a tin whistle) was broadcast were occupied by new males earlier than when conspecific songs were broadcast. This and subsequent experiments provided convincing evidence that male song keeps out rival males. Moreover,

Figure 9 Schematic representation of a classic experiment on the territorial function of song in great tits. Males were removed from their territory and were replaced by loudspeakers either playing great tit songs ('experimental') or playing back a control stimulus, or no stimulus was broadcast. Shaded areas on the right indicate re-occupation of the territory by other males after 8 or 10 hours. Males settle only in those areas ('control silent', 'control sound') in which no great tit songs were broadcast. Redrawn from Krebs J R and Davies N B (1992), *An introduction to behavioural ecology*, Oxford: Blackwell Scientific.

playback experiments in the field and observations of undisturbed singing in different contexts have shown that males obtain important information from a rival's song on which they base their decision on how to respond to that rival. As in all social behavior, individual specific information is of central relevance when repeated encounters occur. Birds can use such information to distinguish between familiar and unfamiliar individuals. Moreover, males discriminate not only between neighbors and strangers, but also become more aggressive when they hear their neighbor's song from the opposite side of their territory (Figure 10). Thus, information on familiarity with song is linked to a location from which it is usually heard. The reduced response to a neighbor's song when received from the 'correct' direction is termed the 'dear enemy effect' (Stoddard, 1996). Neighbors are rivals in competition for space and matings, but, once a relation is established, neighboring males benefit by reduced aggression toward each other. In addition, neighbors also can act as an early warning system when a stranger starts singing somewhere in the territorial neighborhood, an issue that has received specific attention in studies using birdsong as a model in investigating communication networks (Naguib, 2005; Peake, 2005).

During territorial conflicts, males can signal their readiness to escalate a contest by a range of different singing strategies. There is variation within and among species as to which strategy has which signal value (Todt and Naguib, 2000). Males may time their songs during an interaction so that they overlap songs of their opponent. In almost all species studied to date, song overlapping is used and perceived as an agonistic signal. Another way of agonistically addressing a rival is to match his song type, i.e., to reply with the same song pattern the rival has just sung. Song rate and the rate of switching among different song types can likewise signal changing levels of arousal. In barn swallows (*Hirundo rustica*), the structure of the song can be correlated with levels of testosterone (Figure 11), and thus song may be used as a predictor of fighting vigor. The importance of song in territory defense also may vary with time of the season and

Figure 10 Response strength of male territorial song sparrows to playback, at different locations in their territory, of song of neighbors and strangers. Neighbor/stranger discrimination usually occurs only at the boundary toward the territory of the neighbor whose song is broadcast. At the center of a territory or at the opposite boundary, no discrimination is observed, suggesting that intrusions at these sites are assessed as equally threatening regardless of the identity of the intruder. Redrawn from Stoddard P K *et al.* (1991), *Behavioural Ecology and Sociobiology 29*, 211–215.

Figure 12 Nocturnal singing activity of male nightingales. Bars indicate the period of the breeding cycle when males sing at night. Males cease nocturnal song after pairing but resume it when their females lay eggs. Males that remain unpaired ('bachelors') continue nocturnal song throughout the entire breeding season (bachelors, $N = 12$; mated males, $N = 18$). Modified from Amrhein *et al.* (2002), *Animal Behaviour 64*, 939–944.

Figure 11 Relation between levels of plasma testosterone and number of impulses per rattle in barn swallow songs. Males with more impulses in the rattles of their song had higher testosterone levels, suggesting that song codes information on the physiological state of the singer. Redrawn from Galeotti P *et al.* (1997), *Animal Behaviour 53*, 687–700.

with time of the day. The dawn chorus, for instance, a marked peak of singing activity early in the morning in many temperate-zone songbirds, has a specific function in territory defense in some species (Staicer *et al.*, 1996).

Function in Mate Attraction

Song provides information on male motivation and quality and there is now good evidence that females use this information for pairing and mating decisions. Females may choose a male partner on the basis of his song and, once paired, still mate additionally with other males with more attractive song, in so-called extra-pair copulations. There are two lines of evidence showing the function of song in female choice. Field studies have shown that song traits are linked to mating success and to paternity, and laboratory studies have shown that females are more responsive to specific song traits. In many bird species, males change their singing behavior after pairing, suggesting that the function of song differs between the period of mate attraction and the period thereafter. Many warblers show a marked decrease in singing activity after pairing, and nocturnally singing birds such as the nightingale cease nocturnal song the day after a female has settled within their territory (Amrhein *et al.*, 2002) (Figure 12).

Sedge warbler (*Acrocephalus schoenobaenus*) males become paired earlier when they have large vocal repertoires (Figure 13), suggesting that repertoire size is a trait used by females in mating decisions. Great reed warbler (*Acrocephalus arundinaceus*) females exhibit more display behavior in response to complex songs than to simple ones (Figure 14) and have been shown to copulate only with those neighboring males that have a song repertoire larger than their social mate has (Figure 15). Dusky warblers (*Phylloscopus fuscatus*) that produce song elements at a higher relative amplitude gain more extra-pair matings than do

Figure 13 Pairing and song repertoire in sedge warblers. Males with larger song repertoires pair earlier, suggesting that song repertoire is used in female choice. Redrawn from Catchpole C (1980), *Behaviour 74*, 149–166.

Figure 14 Female copulation solicitation displays in response to playback of songs of different complexity in great reed warblers. Female displays last longer in response to larger song repertoires, suggesting that males with larger song repertoires are more attractive. Redrawn from Catchpole C *et al.* (1986), *Ethology 73*, 69–77.

males that sing their elements 'less well'. Furthermore, studies have shown that males usually increase their song output when their mate disappears or is removed experimentally. In addition, studies under controlled laboratory conditions have shown that females show strong preferences for specific song traits. Females show more copulation solicitation displays (a specific posture females use to elicit copulations) when hearing large song repertoires than when hearing smaller, less complex song repertoires, as in great reed warblers (Figure 14). In canaries, a substructure of the song, a complex syllable category (a trill), has been identified as a 'sexy syllable' to which females pay specific attention. More recent studies have used operant techniques in which females were allowed to peck a key to release playback of songs of different complexity, and with this technique it is possible to test female preference for song in more detail (Riebel, 2003).

Comparison to Human Speech

Both human speech and birdsong consist of finite sets of smaller units (humans: phonemes; birds: elements or syllables) that are arranged by a species-specific combinatorial system into larger units (humans: words and sentences; birds: phrases and songs). Despite the very different functions fulfilled by birdsong (territorial and mate-attracting signal) and human speech (physical carrier of human language), there are many parallels. Both types of communication are acquired by a form of channeled social learning, whereby some sounds are more likely to be copied than others. Learning of speech by humans and song by birds takes place without obvious external reward, occurs at specific phases during development, and relies on auditory feedback and a prolonged phase of motor learning (birds: subsong; humans: babbling). As in the (prelinguistic) acquisition of phonemes in humans, in birds a sensory learning phase precedes the first production attempts. Babbling babies, like young birds, undergo a long phase of motor practice during which initial phonological (over)production moves toward producing phonological units that become more and more similar to the phonologies that are heard. In human speech acquisition, learning to produce the phonetic units precedes the mapping of meaning onto these units. It is thus in the acquisition of auditory memories and in the first (prelinguistic) phase of motor learning that birdsong and speech development can perhaps best be seen as an analogue.

Next to similarities on the behavioral level, highly specialized brain regions control vocal learning, memory, production, and perception, both in human speech and in birdsong. Songbirds' vocal learning ability is mirrored in highly specialized forebrain areas solely dedicated to the acquisition and perception of vocalizations and to the control of the complex motor patterns underlying song. Both song and speech acquisition have sensitive periods during which learning is greatly enhanced and sensory experience leads to learned representations guiding vocal output via complex feedback mechanisms. Increasing experience and sub-adult hormonal changes later slow down or stop further acquisition learning. These similarities of the acquisition of vocal units suggest that similar neural mechanisms might underlie vocal learning in birds and in humans. In line with this, studies on functional morphology of the bird brain now suggest that avian forebrain areas are functionally much more equivalent to mammalian forebrain areas than previously thought. Moreover, central and peripheral control of both song and speech show lateralization, which is a clear indication of evolutionarily highly derived systems. Birdsong phonology is often highly complex and can show

Figure 15 Relation between male song repertoire and survival of their offspring in great reed warblers. Offspring survival (measured as recruits to the next year's breeding population) is positively related to the father's song repertoire size, suggesting that song repertoire is an indicator of male quality. Data from Hasselquist *et al.* (1996), *Nature 381*, 229–232.

more than one hierarchical level (elements show specific associations resulting in phrases and songs; these higher units will also show nonrandom sequential organization). However, in birdsong there is no evidence of the recursiveness (the embedding of units of the same hierarchical category within each other) that is found in human language. Moreover, alternative combinations of units do not normally create different semantic meanings, except in a very limited sense: Different combinations of units may code for general information such as species, age, gender, and motivation. Song is thus best seen as an analogue to human speech (not language) and to nonverbal aspects of acoustic communication. In this respect, it is a valuable model for comparative studies (Doupe and Kuhl, 1999; Hauser *et al.*, 2002) on mechanisms (behavioral, neurobiological, gene regulatory, and hormonal) as well as on the evolution of vocal learning (Fitch, 2000). In addition, how learning processes affect diachronic change and geographical variation of signaling provides interesting opportunities for comparative research into gene-culture co-evolutionary processes (*see* **Dialects in Birdsongs**).

Bislama, an English-lexifier pidgin-creole, is the national language of Vanuatu, a republic in the southwest Pacific within the region of Melanesia. Along with English and French, it is also one of the official languages of the country. As the national language, it is spoken by the majority of the population as either a first or second language. There are as many as 100 distinct languages spoken in Vanuatu (81 actively spoken languages according to Lynch and Crowley, 2001) for a population of only 186 678 (1999 census), and as a result Bislama is vital as a lingua franca between speakers of different language groups. In urban areas and even in some rural areas, it is fast becoming the main language used in daily life. According to the 1999 census, in urban areas, where there is a great deal of intermarriage, Bislama is the main language used at home in 58% of households; in rural areas, this figure is considerably lower, at 13.3%. However, even in the most remote areas of the country only a minority of elderly people are not fluent in Bislama. Currently, English and French are the principal languages of education in Vanuatu and Bislama is generally banned in schools. However, Bislama is used for many other government and community services. For example, the majority of radio broadcasts are in Bislama, although only some of the content of newspapers is published in Bislama. Parliamentary debates are conducted in the language, as are local island court cases.

Bislama is a dialect of Melanesian Pidgin, mutually intelligible with Solomons Pijin (Pijin), spoken in Solomon Islands, and Tok Pisin, spoken in Papua New Guinea. Thus, the language is not just an important lingua franca of Vanuatu, but also a common regional language that allows for communication among most peoples of Melanesia. Only in New Caledonia is Melanesian Pidgin not spoken.

For example, the majority of radio broadcasts are in Bislama, although only some of the content of newspapers is published in Bislama. Parliamentary debates are conducted in the language, as are local island court cases.

Bislama is a dialect of Melanesian Pidgin, mutually intelligible with Solomons Pijin (Pijin), spoken in Solomon Islands, and Tok Pisin, spoken in Papua New Guinea. Thus, the language is not just an important lingua franca of Vanuatu, but also a common regional language that allows for communication among most peoples of Melanesia. Only in New Caledonia is Melanesian Pidgin not spoken.

The formation and development of Bislama, and of Melanesian Pidgin generally, took place within Vanuatu and other regions of Melanesia and also in Australia and other countries of the Pacific. A pidgin first started to emerge in Vanuatu (known as the New Hebrides at the time) in the mid-1800s as a result of the sandalwood and sea slug trade. Further development took place in the second half of the 19th century, with increasing numbers of Ni-Vanuatu being recruited to work on plantations both inside Vanuatu and in other areas of the Pacific, particularly in the sugarcane plantations of Queensland and Fiji (Crowley, 1990a). During the early decades of the 20th century, the language stabilized, such that its structure today is very close to what it was then. The status of and need for Bislama as a lingua franca within the country increased in the period leading up to independence in 1980, to the extent that today it has become the unifying language of the nation.

The majority of the Bislama lexicon, approximately 84–90%, is derived from English, reflecting its history of development alongside English-speaking traders, plantation owners, and colonists. Only approximately 3.75% of the vocabulary originates from the vernacular languages and 6–12% derives from French (Crowley, 2004). Of those words that derive from local languages, the majority describe cultural artifacts and concepts and endemic floral and faunal species that have no common names in English, such as *nasara* 'ceremonial ground,' *navele* '*Barringtonia edulis*,' and *nambilak* 'buff-banded rail.' Note that many of these words start with *na-*, the form of an article or noun marker in many Vanuatu languages.

Although the majority of the lexicon is derived from English, the grammar of Bislama is greatly influenced by the vernacular languages. For example, in the pronominal system there is an inclusive-exclusive distinction in the first person, *yumi* 'we (inclusive)' is distinguished from *mifala* 'we (exclusive).' Dual and trial number is also distinguished from the plural, as *yutufala* 'you (two),' *yutrifala* 'you (three),' and *yufala* 'you (pl.).' Another feature that Bislama inherits from the substratum languages is reduplication. Reduplication is a productive process for both verbs and adjectives, but it is rarer for nouns. In verbs, reduplication can mark an action as being continuous, habitual, reciprocal, or random. It can mark intensity in both verbs and adjectives, and it also marks plurality in adjectives.

Like English and many Vanuatu languages, Bislama is characterized by AVO/SV word order, and this is the only means of recognizing the subject and object of the clause. Peripheral arguments are marked by prepositions. The preposition *long* has a wide general use; it marks the locative, allative, ablative, and dative. It can also mark the object of comparison in a comparative construction, the instrumental, and a number of other less easily defined functions. The preposition *blong* also has a number of functions, marking the possessor in a possessive construction, a part-whole relationship, and a purposive role. Prepositions marking other semantic roles are *wetem* 'with' (instrumental and comitative), *from* 'for, because of' (reason), and *olsem* 'like' (similitive).

As is true of most pidgin languages, there is little marking of tense, aspect, and mood. The preverbal markers *bin* and *bae* mark the past and future tense, respectively. However, it is possible for an unmarked verb, preceded only by its subject, to indicate either past, present, or future tense, depending on the context. A number of auxiliaries also occur, with aspectual or modal functions, such as *stap,* marking a continuous or habitual action; *mas* 'must'; *save* 'be able'; and *wantem* 'want.' Verb serialization is a productive process in Bislama, encoding various meanings and functions such as a cause-effect relationship; a causative; or direction, position, or manner of action.

Black Islam

R Turner, University of Iowa, Iowa City, IA, USA

The involvement of black Americans with Islam reaches back to the earliest days of the African presence in North America. The history of black Islam in the United States includes successive and varied presentations of the religion that document black Americans' struggles to define themselves independently in the context of global Islam. This article is a historical sketch of black Islam that focuses on the following topics: Islam and transatlantic slavery, early 20th-century mainstream communities, early 20th-century racial separatist communities, and mainstream Islam in contemporary black America.

Islam and Transatlantic Slavery

Muslim slaves – involuntary immigrants who had been the urban-ruling elite in West Africa, constituted at least 15% of the slave population in the United States in the 18th and 19th centuries. Their religious and ethnic roots could be traced to ancient black kingdoms in Ghana, Mali, and Songhay. Some of these West African Muslim slaves brought the first mainstream Islamic beliefs and practices to America by keeping Islamic names, writing in Arabic, fasting during the month of Ramadan, praying five times a day, wearing Muslim clothing, and writing and reciting the Qur'an.

The fascinating portrait of a West African Muslim slave in the United States who retained mainstream Islamic practices was that of a Georgia Sea Island slave, Bilali. He was one of at least 20 black Muslims who are reported to have lived and practiced their religion in Sapelo and St. Simon's Islands during the antebellum period. This area provided fertile ground for mainstream Islamic continuities because of its relative isolation from Euro-American influences. Bilali was noted for his religious devotion: for wearing Islamic clothing, for his Muslim name, and for his ability to write and speak Arabic. Islamic traditions in his family were retained for at least three generations.

Fascinating portraits of outstanding African Muslim slaves in the United States, which exist in the historical literature, also include Job Ben Solomon (1700–1773), a Maryland slave of Fuble Muslim origins; Georgetown, Virginia, slave Yarrow Mamout, who was close to 100 years old when his portrait was painted by Charles Wilson Peale; Abd al-Rahman Ibrahima (1762–1825), a Muslim prince in Futa Jallon, who was enslaved in Mississippi; Omar Ibn Said (1770–1864), a Fuble Muslim scholar who was a slave in North Carolina and pretended a conversion to Christianity; and numerous others.

By the eve of the Civil War, the black Islam of the West African Muslim slaves was, for all practical purposes defunct, because these Muslims were not able to develop community institutions to perpetuate their religion. When they died, their presentation of Islam, which was West African, private, with mainstream practices, disappeared. But they were important nonetheless, because they brought black Islam to America.

Early 20th-Century Mainstream Communities

In the late 19th century, the Pan-Africanist ideas of a Presbyterian minister in Liberia, Edward Wilmot Blyden (1832–1912), which critiqued Christianity for its racism and suggested Islam as a viable religious alternative for black Americans, provided the political framework for Islam's appeal to black Americans in the early 20th century. Moreover, the internationalist perspective of Marcus Garvey's Universal Negro Improvement Association and the Great Migration of more than one million black southerners to northern and midwestern cities during the World War I era provided the social and political environment for the rise of black American mainstream communities from the 1920s to the 1940s. The Ahmadiyya Movement in Islam, a heterodox missionary community from India, laid the groundwork for mainstream Islam in black America by providing black Americans with their first Qur'ans, important Islamic literature and education, and linkages to the world of Islam.

Mufti Muhammad Sadiq, the first Ahmadiyya missionary to the United States, established the American headquarters of the community in Chicago in 1920. He recruited many of his earliest black American converts from the ranks of Marcus Garvey's Universal Negro Improvement Association. By the mid-1920s, Sadiq and black American converts, such as Brother Ahmad Din and Sister Noor, had established *The Muslim Sunrise*, the first Islamic newspaper in the United States, and thriving multiracial communities in Detroit, Michigan; Gary, Indiana; and St. Louis, Missouri.

There were several dynamic early 20th-century communities to which black American Sunni Muslims can trace their roots. These communities – the Islamic Mission to America, Jabul Arabiyya, and the First Cleveland Mosque – were influenced by Muslim

immigrants and their own constructed presentations of mainstream Islam in black communities.

Four things influenced the Islamic Mission to America in New York City: the local Muslim immigrant community; Muslim sailors from Yemen, Somalia, and Madagascar; the Ahmadi translation of the Qur'an; and the black American community. Shiek Daoud was born in Morocco and came to the United States from Trinidad. Daoud's wife, 'Mother' Sayeda Kadija, who had Pakistani Muslim and Barbadian roots, became president of the Muslim Ladies Cultural Society. The Islamic Mission to America published its own literature about mainstream Islam. Sheik Daoud believed that black American Muslims should change themselves not only spiritually, but also in "language, dress, and customs" to connect them to Islamic civilization and revivalism in Asia and Africa. Daoud immersed himself in the complex experiences of, and boundaries between, Muslim immigrants and black converts to Islam in New York City and Brooklyn from the 1920s to the 1960s.

Muhammad Ezaldeen, an English teacher and principal, was a Moorish Science Temple member in Newark, New Jersey, in the 1920s. After several years of Arabic and Islamic studies in Egypt, he returned to the United States to promote the Islamic connections between Arab and black American culture in the Adenu Allahe Universal Arabic Association. In 1938, he and his followers established Jabul Arabiyya, a Sunni Muslim community ruled by Islamic law in rural West Valley, New York. Communities of this association were founded in New Jersey (Ezaldeen Village); Jacksonville, Florida; Rochester, New York; Philadelphia, Pennsylvania; and Detroit, Michigan. These communities emphasized the hijra – the movement of early Arabian Muslims from Mecca to Medina in 622 C.E. – as the centerpiece of their spiritual philosophy.

Tensions between black American and immigrant leaders in the Ahmadiyya Movement in Islam resulted in the establishment of the Sunni First Cleveland Mosque by Imam Wali Akram in 1936 and the First Muslim Mosque in Pittsburgh by Nasir Ahmad and Saeed Akmal in the same period. Wali Akram was one of the first black American Muslim converts to sever all ties with the immigrant community in order to establish mainstream Islam in a black American community. The imam and his wife, Kareema, learned Arabic and taught the language and the recitation of the Qur'an to black converts. One of Akram's unique contributions to the black American community was the Muslim Ten Year Plan, which utilized the faith and discipline of Sunni Islam to get black people off welfare and to make black American Muslim communities economically and socially self-sufficient.

In 1943, Wali Akram conducted the first session of the Uniting Islamic Society of America in Philadelphia. This national group was established to unify disparate black American mainstream organizations against the agenda of foreign Muslims. The Uniting Islamic Society of America met several times from 1943 to 1947 to develop a united platform on doctrine, politics, women's issues, leadership, and relations with the immigrant community. Ultimately, this organization failed because of personality conflicts and different visions of the black American mainstream Islamic community.

The grassroots work of these mainstream groups with their emphasis on study of the Arabic language and the Qur'an, the transformation of domestic space and community life, adoption of Islamic dress and customs, and cosmopolitan travels to Egypt, Morocco, Trinidad, India, Barbados, Jamaica, and New York City are key to understanding the Muslim lifestyles of these early Sunni black American converts as expressions of global Islam. These early black American Sunni communities were overshadowed by the successful missionary work of the heterodox Ahmadiyya movement and later by the ascendancy of the Nation of Islam in the 1950s. Mainstream Islam did not become a popular option for black American Muslims until the 1960s.

Early 20th-Century Racial Separatist Communities

Noble Drew Ali (1886–1929) was the founder of the Moorish Science Temple of America in Newark, New Jersey, in 1913. This was the first mass religious community in the history of black American Islam and the black nationalist model for the Nation of Islam. In the late 1920s, the Moorish American community in the United States grew to approximately 30 000 members and was the largest Islamic community in the United States before the ascendancy of the Nation of Islam in the 1950s.

The Moorish Americans, who established branches of their community in several northern cities and made their headquarters in Chicago in the 1920s, claimed to be descendants of Moroccan Muslims and constructed a nationalist identity by changing their names, nationality, religion, diet, and dress. Their esoteric spiritual philosophy was constructed from Islam, Christianity, and black Freemasonry. In 1927, Ali wrote their sacred text, the *Holy Koran of the Moorish Science Temple*, also called the *Circle Seven Koran*, to teach his followers their preslavery religion, nationality, and genealogy. To support his

case for a Moorish American identity, he emphasized two important points: first, black Americans were really 'Asiatics' – the descendants of Jesus, and second, the destiny of western civilization was linked to the rise of the 'Asiatic' nation – Asians, Africans, Native Americans, and black Americans.

In the *Holy Koran of the Moorish Science Temple*, Noble Drew Ali also argued that truth, peace, freedom, justice, and love were the Islamic ideals that his followers should emulate. The Moorish Science Temple survived in factions after Noble Drew Ali's mysterious death in 1929 and received official recognition for its Islamic linkages to Morocco from the Moroccan ambassador to the United States in 1986. Major communities exist today in Baltimore, Pittsburgh, and Los Angeles.

The Nation of Islam began in Detroit, Michigan, in 1930 as the Allah Temple of Islam – a small black nationalist Islamic movement founded by W. D. Fard, an immigrant Muslim missionary, who preached a philosophy of political self-determination and racial separatism to the newly arrived black southerners of the Great Migration. Fard believed that Western civilization would soon end in a race war, and he established an institutional framework – the Fruit of Islam, The Muslim Girls Training Corps, and the University of Islam to separate black Muslims from white Christian America. Although his ethnic and Islamic identity remains undocumented, Fard might have been a Druze, a sectarian branch of the Ismaili Shii Muslims, who have a long documented tradition of human divinity and esoteric interpretations of the Qur'an.

A victim of police brutality, he disappeared mysteriously in 1934, after he assigned leadership of his community to Elijah Muhammad (1897–1975), who led the Nation of Islam from 1934 to 1975 from its Chicago headquarters and was an important figure in the development of black nationalism and Islam among black Americans in the 20th century. The members of the Nation of Islam believed that their descendants were the Asiatics, who were the original Muslims and the first inhabitants of the earth, and they claimed a divine identity for their founder, W. D. Fard, and prophetic status for Elijah Muhammad.

During World War II, the Nation of Islam's membership decreased dramatically as Elijah Muhammad and his son, Herbert, became involved politically with Satokata Takahashi, a Japanese national organizer among black Americans, and they were prisoners in the federal penitentiary in Milan, Michigan, from 1943 to 1946. In the 1950s and 1960s, as black Americans and Africans cracked the political power of white supremacy in the United States and abroad, Elijah Muhammad's institutional quest for economic power made the Nation of Islam into the wealthiest black organization in American history. In this era, the Nation of Islam provided a community model and political inspiration for the black power movement. Malcolm X's phenomenal organizing efforts among young lower-class black men and women in the northern cities created powerful constituencies for the Nation of Islam across the United States, and the *Muhammad Speaks* newspaper, which was edited by a leftward-leaning staff, provided exemplary coverage of international news and anticolonial struggles in Asia and Africa. Malcolm X provided a powerful message of racial separatism, self-discipline, and black community development in the midst of the integrationist strategies and nonviolent demonstrations of the civil rights movement. However, as the political tactics and strategies of the civil rights and the black power movements became more sophisticated Elijah Muhammad's economic agenda for his community resulted in a conservative vision regarding political activism; this was one of the primary factors that led to Malcolm X's departure from the Nation of Islam.

In the wake of President Kennedy's assassination in 1963, a public controversy between Elijah Muhammad and Malcolm X evolved into a permanent separation. Establishing a new spiritual and political identity, Malcolm abandoned the heterodox, racial-separatist philosophy of the Nation of Islam and converted to multiracial Sunni Islam during the last year of his life.

In March, 1964, he founded the Sunni Muslim Mosque, Inc. in Harlem as the base for a spiritual program to eliminate economic and social oppression against black Americans. Then, Malcolm made the hajj, the Islamic pilgrimage to Mecca, Saudi Arabia, in April 1964. There, he changed his name from Malcolm X to El Hajj Malik El-Shabazz, which signified the adoption of a new identity that was linked to mainstream Islam. Malcolm's Sunni Islamic identity became a significant model for many black Americans who have converted to mainstream Islam since the 1960s.

After Mecca, Malcolm traveled extensively through North and West Africa establishing important religious and political linkages with Third World nations. These profound international experiences deepened his Pan-African political perspective. When Malcolm returned to the United States, he founded the Organization of Afro-American Unity in New York City on June 29, 1964, to promote his political perspective, which linked the black American struggle for social justice to global human rights issues in Africa, Asia, Latin America, and the Caribbean.

During the final weeks of Malcolm's life in 1965, he began to talk about the black American freedom struggle as an aspect of "a worldwide revolution" against racism, corporate racism, classism, and sexism. Because of his potential (if he had lived) to unite many black Muslims and black Christians in America and abroad in a global liberation struggle that could have involved the United Nations, there is no question that the American intelligence community had the incentive to be involved in Malcolm X's murder.

Since 1978, Louis Farrakhan has led the revived Nation of Islam and published the *Final Call* newspaper. Farrakhan speaks fluent Arabic and travels frequently to the Middle East and West Africa to promote the issues of black American Muslims. His greatest achievement as leader of the Nation of Islam was the Million Man March in 1995, which brought the healing spirit of Islam to more than one million black men who gathered in Washington, D.C. This was the largest political gathering of black Americans in American history. On Saviours' Day in Chicago in February 2000, Farrakhan announced changes in the Nation of Islam's theology and ritual practices that will bring his community closer to the center of mainstream Islam in North America.

Major factions of the Nation of Islam are led by John Muhammad in Highland Park, Michigan; Silis Muhammad in Atlanta, Georgia; and Emmanuel Muhammad in Baltimore, Maryland. The Five Percenters, also called the Nation of Gods and Earths, are popular among rap musicians and the hip-hop community; they were founded by Clarence 13X in New York City in 1964.

Mainstream Islam in Contemporary Black America

Large numbers of black Americans have turned to mainstream Islamic practices and communities since Malcolm X's conversion to Sunni Islam in 1964. Like Malcolm X, black American Sunni Muslims see themselves as part of the mainstream Muslim community in the world of Islam and study Arabic, fast during the month of Ramadan, pray five times a day, make the hajj to Mecca, practice charity and social justice, and believe in one God and Muhammad as his last prophet. The dramatic growth of mainstream Islam in black America is also related to the arrival of more than three million Muslims in the United States after the American immigration laws were reformed in 1965.

Elijah Muhammad's son, Warith Deen Mohammed, has played an important role within mainstream Islam in the United States. He became the Supreme Minister of the Nation of Islam after his father's death in 1975. During the first years of his leadership, he mandated sweeping changes, which he called the "Second Resurrection" of black Americans, in order to align his community with mainstream Islam. He refuted the Nation of Islam's racial-separatist teachings and praised his father for achieving the "First Resurrection" of black Americans by introducing them to Islam. But now the community's mission was directed not only at black Americans, but also at the entire American environment. The new leader renamed the Nation of Islam the "World Community of Al-Islam in the West" in 1976; the American Muslim Mission in 1980; and the "American Society of Muslims" in the 1990s. Ministers of Islam were renamed 'imams', and temples were renamed 'mosques' and 'masjids'. The community's lucrative financial holdings were liquidated, and mainstream rituals and customs were adopted. Although Warith Deen Mohammed's positive relationships with immigrant Muslims, the world of Islam, and the American government are important developments in the history of mainstream Islam in the United States, his group has diminished in members since the 1980s, and he resigned as the leader of the American Society of Muslims in 2003. In the wake of Mohammed's departure, Mustafa El-Amin, a black American imam in Newark, New Jersey, has attempted to revive this black mainstream Islamic community.

Darul Islam, founded in Brooklyn, New York, in 1962 and having branches in many major American cities, is probably the largest and most influential community of black American Sunni Muslims. Prestige and leadership are based on knowledge of the Qur'an, the hadith, and the Arabic language. Darul Islam is a private decentralized community, which did not allow immigrants in its midst until the mid–1970s. The Hanafi Madh-hab Center, founded by Hammas Abdul Khalis in the 1960s, is a black American Sunni group that made headlines in the 1970s because of its conversion of the basketball star Kareem Abdul Jabbar and the assassination of Khalis's family in their Washington, D.C., headquarters. Siraj Wahhaj leads an important black Sunni community in Bedford Stuyvesant in Brooklyn, New York.

Although black American Muslims populate multiethnic Sunni masjids and organizations across the United States, reportedly there are subtle racial and ethnic tensions between black American and immigrant Muslims. Immigrant Muslims talk about 'a color- and race-blind Islam' and the American dream, whereas black American Muslims continue to place Islam at the forefront of the struggles for social justice, as the United States has entered a new century of frightening racial profiling and violence

in a post–September 11 world. Certainly, black American and immigrant Muslims have a lot to learn from each other and need to present a united front on social justice issues, as mainstream Islam's appeal and ascendancy in the United States in this century may depend on American Muslims' ability to claim a moral and political high ground on social justice and racial issues that have historically divided the American Christian population. In the wake of post–September 11 legislation, such as U.S. Patriot Act that has enabled the detention of Muslim immigrants and Muslim Americans, black American Muslims are probably in the strongest position to refute arguments that claim there is a clash of civilizations between Islam and the West because of the ethnic group's history of contributions to the American experience.

Although there are no conclusive statistics, some observers estimate that there are six to seven million Muslims in the United States and that black American Muslims comprise 42% of the total population. Finally, the future of American Muslim communities in the 21st century may be determined significantly by the conversion experiences and social-political perspectives of young black Americans. According to *A report from the Mosque Study Project 2000*, published by the Council on American–Islamic Relations, black Americans constitute the largest percentile of the yearly converts to mainstream Islam, and many of these converts are young black men and women who reside in urban locations.

Definition of Terms

Blaming and denying, frequent and constitutive features of conflict talk, are expressed in many different direct or indirect linguistic modes, depending on the specific broad and narrow contexts of the conversations, on the functions of the utterances, and on the formality of the interactions. Moreover, the usages and functions of blaming and denying are dealt with in many disciplines (psychoanalysis, sociopsychology, political sciences, sociology, anthropology, psychiatry, linguistics, argumentation studies, history, and so forth). For example, the specifics of blaming and denying can be related to psychological and psychiatric syndromes, wherein certain patterns are viewed as compulsive and out of control, and to political debates and persuasive discourses, in which blaming and denying, by serving to promote one group and to debase or attack the opposition, are carefully and strategically planned and serve positive self-presentation and negative other-presentation. Thus, the linguistic analysis of those verbal practices that construct a dynamic of 'justification discourses' requires methodologies that are adequate for the specific genre and context (speech act theory, conversation analysis, discourse analysis, text linguistics, argumentation analysis, rhetoric, and so forth) (for overviews of some important features of conflict talk in specific domains from varying perspectives, see Austin, 1956/1957; Gruber, 1996; Kopperschmidt, 2000) (*see also* **Discourse Markers; Psychoanalysis and Language**).

The Use of Blaming and Denying: Domains and Genres

Blaming and denying occur both in private, intimate conversations and in the domains of politics, the law, and the media. Linguistic manifestations depend on the choice of genre and on the formality/informality of the settings. For example, studies on racist or anti-Semitic discourses show that the more informal the setting (anonymous conversations, conversations with friends, or e-mail postings), the more likely the use of abusive language, derogatory terms, and discriminatory language. If the setting is more formal (for example, a televised debate or political speech), the wording of 'blaming' is mitigated, more indirect, and often introduced by disclaimers (*Some of my best friends are Jewish/Turks, but…*; *I love all people, but…*; and so forth), after which, the 'other' is attacked, often by a projection of guilt or by a turning of the tables (van Dijk, 1993; Wodak, 2004) (*see* **Mitigation**).

Justification discourses have been analyzed in studies dealing with court trials (Scott and Lyman, 1976; Alexy, 1996), relationships between parents and children (Wodak and Schulz, 1986), intimate relationships (Jacobson and Kettelhack, 1995; Dejudicibus and McCabe, 2001), media debates (Lamb and Keon, 1995; Dickerson, 1998), and the speeches, print media, slogans, and debates of election campaigns (Chilton, 2004); they have also been focused on in the police environment and other bureaucratic settings (Ehlich and Rehbein, 1986) and during proceedings in which official bodies have attempted to come to terms with traumatic past events (Ensink and Sauer, 2003; Martin and Wodak, 2003). One of the most significant manifestations of denial is 'Holocaust denial,' in which speakers and writers suggest evidence or arguments for their claim that the Holocaust never happened, being – in their opinion – invented by a (supposedly Jewish) conspiracy (Lipstadt, 1993). There is no doubt that such a denial serves many functions, probably primarily to reject (individual and/or collective) guilt by counterattacking an imaginary opponent.

Justification discourses are not restricted to oral, spontaneous texts; the same types of blaming and denying are also manifest in many written genres, reflecting the intentions and aims of the authors of newspaper articles, letters, party programs, election materials, or legal documents. The visual genres, especially caricature, lend themselves to justification discourses through the presentation of, and debate about, visual evidence (e.g., photos representing war crimes; see later).

The Linguistic/Pragmatic Analysis of Blaming and Denying

Depending on the genre, different linguistic and/or pragmatic approaches are used in analysis. Most obviously, speech act theory allows for the categorization of direct and indirect forms of blaming and denying in conversations or debates (*see* **Speech Acts**). In conversation analytic terms, blaming consists of two parts: on the one hand, a specific action is presented; on the other hand, there is the negative evaluation of this action, often an accusation. Gruber (1996) listed several important forms of these so-called 'adjacency pairs' (*see* **Conversation Analysis**). Accusations can either relate to situational factors or to factors that are outside of the specific setting. Either way, perceived violations of rules and norms may trigger the speech act of blaming. Moreover, accusations can be formulated either directly or indirectly, depending on the knowledge that the participants in the debate or conflict are supposed to possess.

Reacting to aggressive behavior, a defendant can either apologize and try to legitimize her/his actions through accounts, anecdotes, various kinds of evidence, and so forth (Scott and Lyman, 1968/1976), or the accusation can be rejected. Conversation analysts propose that rejection is the preferred mode of reaction (Pomerantz, 1978). Silence can also occur; this is usually interpreted as the accused acknowledging the legitimacy of the accusation. Sometimes, a counteraccusation may follow, or the accusation may be partially or completely denied. These patterns of speech acting can create a conversational dynamic that it is very difficult to overcome.

Argumentation analysis focuses on typical modes of arguments that are used in conflict talk. Certain *topoi* characterize blaming as well as denying; both the *topoi* and the fallacies are difficult to deconstruct, such that a rational debate becomes almost impossible. Many argumentative moves can be made while blaming an opponent, ranging from attacking the opponent personally (*argumentum ad hominem*) or threatening the opponent and his/her freedom of expression (*argumentum ad baculum*), to undermining the credibility of the opponent by showing that he/she does not adhere to the point of view that he/she publicly defends (*tu quoque*, a variant of the *ad hominem* argument) (for typical fallacies in conflict talk, see van Eemeren and Grootendorst, 1992; Reisigl and Wodak, 2001) (*see also* **Argument Structure**).

What holds for argumentation is also true of denials. Denials can occur as disclaimers (*I am not a racist, sexist, etc., but…*) or as direct rejections of

certain accusations; they can be formulated as counterattacks (identification with the aggressor), or as 'straw man' fallacies (when a fictitious standpoint is attributed to the opponent, or the opponent's actual standpoint is being distorted). Some of these fallacies have already been described in classical rhetoric (as in Aristotle's *De sophisticis elenchis*), wherein fallacies are defined as incorrect moves adopted in dispute to refute a thesis (see van Eemeren and Grootendorst, 2004) (*see also* **Rhetoric, Classical**).

Discourse analysis focuses on the strategies employed in blaming and denying. These strategies are realized linguistically in various, predictable ways, depending on the context. Moreover, mitigation and intensification markers are of obvious interest, because they serve to open or close options for debate and argument. Discursive strategies such as scapegoating, blaming the victim, blaming the messenger, victim–perpetrator reversal, the straw man fallacy, turning the tables, and so forth have been studied extensively; they all belong to the category of 'discourses of justification' (Wodak *et al.*, 1990; Van Leeuwen and Wodak, 1999). 'Strategy' is defined as a more or less detailed and directed plan of practices (including discursive practices), adopted to achieve a particular social, political, psychological, or linguistic aim. As far as discursive strategies, i.e., systematic ways of using language, are concerned, they are located at different levels of linguistic organization and complexity. Strategies, realized as macroconversational patterns or moves, are often used to structure public debates, such as on AIDS, poverty, economic problems, the welfare state, racism, xenophobia, and anti-Semitism; as well as on sexism and the representation of rape (Carlson, 1996; Maynard, 1998; Anderson *et al.*, 2001).

An Example: The War-Crimes Debate

Between 1995 and 2004, the Hamburg Institute for Social Research created and presented to the public two itinerant exhibitions, under the common denomination *Crimes of the German Wehrmacht* (see Heer *et al.* (2003); for an extensive analysis of the debates surrounding the exhibitions, as well as an analysis of the historical narratives in Germany and Austria around the discursively constructed images of the German *Wehrmacht*, see also Wodak (2005)). The first exhibition was shown from March, 1995, through the end of 1999, at a total of 33 venues in the Federal Republic of Germany and in Austria. The second exhibition was shown to the public for the first time in Berlin in November, 2001; the new exhibition upheld the main statement of the former exhibition (which had been hotly debated and often criticized, both in the press and in other fora of discussion): viz., that during World War II, the *Wehrmacht* was extensively involved, as an institution, in planning and implementing an unprecedented war of annihilation. However, the second exhibition had shifted to a focus on texts, whereas the first exhibition had presented mainly photographs. The exhibitions demonstrated the at times passive, at times active, role of the *Wehrmacht* in German war crimes. From November, 2001, through March, 2004, this second exhibition was displayed in 11 German cities, as well as in Vienna and in Luxemburg, attracting more than 420 000 visitors (the Hamburg Institute's first exhibition on the same subject had attracted about 800 000 visitors). Both exhibitions triggered a discussion throughout the Federal Republic of Germany and Austria about the crimes committed during the war waged by the National Socialist regime and about how postwar German society dealt with this part of its past. Never before had the West German and Austrian publics discussed their past with such intensity and for such a long period.

In the debates surrounding the two exhibitions (1995 and 2001) on war crimes committed by the German *Wehrmacht* in World War II, typical discursive strategies of blaming and denying become apparent. Interviews with visitors to the exhibition emphasized, on the one hand, the fact of "not having seen, known, or heard anything" about the deportation and extermination of prisoners of war as well of racial and ethnic groups such as Jews, Roma, and other civilians. On the other hand, the blame was projected onto 'a few soldiers,' who were labeled as 'exceptions'; in this way, any explicit involvement of the *Wehrmacht* as an institution was denied (Heer *et al.*, 2003). The same patterns are found in the reports on hearings of the South African Truth and Reconciliation Commission (TRC) and in the debates about the pictures of tortured Iraqi prisoners that first appeared in 2004, during the Iraq war.

Figure 1 summarizes the most important strategies of denial (i.e., discursive reactions to blaming). The main distinction shown in the diagram is between people orienting themselves toward the context, i.e., acknowledging the fact that they are watching an exhibition about the German army's war crimes, and taking a stance toward that fact (the left side of the diagram), and people who do not orient themselves toward the context (the right side of the diagram).

The first three strategies negate the very context, at least at the explicit level:

1. People do not position themselves with respect to their belief in the existence of war crimes. This may be done by (a) refusing to deal with the issue

Figure 1 Array of discursive strategies (see Benke and Wodak, 2003: 124). Abbreviations: NS, Nazi state; SS, *Schutzstaffel* (Hitler's 'protection guard' unit; SD, *Sicherheitsdienst* (security police). From Benke G & Wodak R (2003). 'The discursive construction of individual memories: how Austrian ''German Wehrmacht'' soldiers remember WW II.' In Wodak R & Martin J R (eds.) *Re/reading the past*. Amsterdam: Benjamins. 115–138. With kind permission by John Benjamins Publishing Company, Amsterdam/Philadelphia.

at all, (b) claiming ignorance, combined with a refusal to take a stance (people using this strategy claim that they do not/did not know anything about what happened), or (c) claiming victimhood (people adopting this strategy may offer elaborate stories about all sorts of terrible things that happened to them during and after the war; in this way, they are able to avoid having to deal with the issue of war crimes committed by the *Wehrmacht*).

2. People lift the discussion up to a more general level. Using the strategy of scientific rationalization, some people launch into extensive analyses of the Nazi state, aiming to explain how National Socialism came to be successful, why people were in favor of the Nazis, and so on. (This strategy was found among all of the visitors to the exhibitions, both in Germany and in Austria.)
3. People engage in 'positive-self' presentation: the interviewee tells stories that portray him/her as having performed good and praiseworthy deeds. War crimes are acknowledged, yet the actor claims to have had no part in them (or fails to mention any relation to war crimes); the interviewees declare themselves to have acted responsibly, in such a way that they are morally without blame.

The following strategies acknowledge the fact of the exhibition at some level, either by acceptance or refutation:

1. In a strategy of acceptance, some people try to understand what happened.
2. For the most part, however, people try not to deal with the past; instead, they use several strategies to justify, and/or deny, the existence of the war crimes, either by (a) relativizing the facts (people using this strategy will start to enumerate crimes of other nations, or use clichés, such as "every war is horrible") or by (b) adopting two further strategies seeking to provide a (pseudo-) rational causal explanation for the war crimes. The first is characterized by the interviewees' continuing the unmitigated and undisguised use of Nazi ideology and Nazi propaganda of the kind that was promoted during that time to justify the war: "If we hadn't fought them, the Russians would be at

the Atlantic Ocean today." The second of these strategies similarly stems from the Nazi period, but at least it acknowledges, however implicitly, that the war's moral status is questionable: "Others forced us."

3. Another strategy acknowledges that crimes indeed did happen, and that the army should perhaps be held responsible, yet it attributes the responsibility to someone higher up, possibly within the army: "I only did my duty."
4. Yet another strategy is the "Not 'we,' but 'them'" strategy, which attributes the crimes to units of the army other than the one in which the interviewee served. A variant is: "Not 'this,' but 'that'" (e.g., "We didn't bomb Copenhagen, only Rotterdam").
5. Finally, there is a strategy that simply denies the fact that war crimes happened at all. In this strategy, people often turn the focus of their memory on their particular *Wehrmacht* unit, in which horrors of the kind shown in the exhibitions simply were said to be unthinkable.

These discursive strategies are all strategies of responding to an interview situation following the interviewees' presence at an exhibition where thousands of photos of war crimes are shown. Though people employ a number of strategies throughout an interview, their answers can usually be grouped into subsets, each of which serves primarily one of the strategic functions mentioned herein. Some of the strategies are mutually exclusive, i.e., people who completely deny the existence of war crimes would not try to relativize them. This appears to be a logical necessity, but as Billig *et al.* (1988) pointed out, logic or logical consistency is not necessarily prevalent in official texts; neither is it in everyday conversation, and even less so in emotionally charged debates or conflicts.

Wilhelm Heinrich Immanuel Bleek was born March 8, 1827, in Berlin, in what was then Prussia; he died in Cape Town, in the Cape Colony in South Africa, on August 17, 1875. He was the son of the famous theologian and specialist in New Testament exegesis Friedrich Bleek, professor of theology at the University of Bonn. His mother was Augusta Charlotte Marianne Henriette, née Sethe, originating from a prominent family of Prussian civil servants. In 1862 in Cape Town, Wilhelm H. I. Bleek married Jemima C. Lloyd, daughter of an archdeacon. They had four children.

Bleek is recognized as the founder of German African Studies. He attended the *Gymnasium* in Bonn and then studied classics and theology at the University of Bonn from 1845 to 1848 and from 1849 to 1851. He chose as his main subject Old Testament studies. Like all researchers in the *Textwissenschaft* of the Old Testament, he compared several Semitic languages to clarify some linguistic points; in this way, he extended his interest to North African (Hamitic) languages. As a consequence, he studied in Berlin in 1848 and 1849 with the famous specialist in Egyptological research, Richard Carl Lepsius. Here Bleek had to transcribe manuscripts of southern African languages, sent mostly by missionaries, into Lepsius's phonetic alphabet. In 1851, Bleek submitted his doctoral thesis at the University of Bonn. From this time on, he propagated the hypothesis that the 'Hottentot' (*Khoekhoe*) language was typologically and genetically linked to the North African (Hamitic) languages: like the Hamitic languages, it was a gender language, differing from the Bantu languages without nominal gender. Later, it was Bleek who created the classificatory term 'Bantu-languages.'

From 1855 on, Bleek worked as an explorer- linguist in southern Africa, though he had to break off his first attempt to explore Africa from the Guinea coast because of fever. In the *salon* of the Prussian ambassador in London, C. C. J. von Bunsen, who was an aristocratic historian, a friend of Bleek's family, a promoter of Sanskrit and Oriental Studies, and a correspondent of Alexander von Humboldt, Bleek got to know Sir George Grey, governor of the Cape province (a British colony at this time) and J. W. Colenso, bishop of Natal. Colenso engaged Bleek formally to accompany him to compile a Zulu grammar, and Bleek arrived in 1855 in Natal. He had great plans for doing extended field work and thus becoming a sort of Livingstone of linguistics, but the only concrete result was a stay at the court of the famous Zulu king Mpanda. All other plans had to be abandoned due to financial and health problems.

The only institutions in the world where scientific research was professionalized and thus constantly remunerated at this time were the Prussian universities; but Bleek was never a member of the staff of a Prussian university. What helped him to survive and to carry on his work, on a more limited scale, was the patronage of Sir George. In 1856, Bleek became the curator and bibliographer of Sir George's enormous collection of documents concerning the languages and the ethnology of southern Africa, and he constantly extended this collection, which was intended to become the most complete collection of material on aboriginal languages from all over the world. So Bleek spent the rest of his life in Cape Town; but here, at least, he had the opportunity in 1858 to meet Livingstone on his way to Mozambique. In 1859, when Sir George was appointed governor of New Zealand, he donated his collection to the South African Public Library at Cape Town, with Bleek as its curator (1862). In 1870, through the influence of Sir George, Bleek's name was placed on Gladstone's *Civil List*, ensuring him a royal pension like other persons such as Charles Darwin or Charles Lyell. Only then, for the first time in his life, did he enjoy financial independence. As a bibliographer, Bleek's main work was *The library of H. E. Sir George Grey, K. C. B.* (1857–1867), but his main scientific

Wilhelm Heinrich Immanuel Bleek was born March 8, 1827, in Berlin, in what was then Prussia; he died in Cape Town, in the Cape Colony in South Africa, on August 17, 1875. He was the son of the famous theologian and specialist in New Testament exegesis Friedrich Bleek, professor of theology at the University of Bonn. His mother was Augusta Charlotte Marianne Henriette, née Sethe, originating from a prominent family of Prussian civil servants. In 1862 in Cape Town, Wilhelm H. I. Bleek married Jemima C. Lloyd, daughter of an archdeacon. They had four children.

Bleek is recognized as the founder of German African Studies. He attended the *Gymnasium* in Bonn and then studied classics and theology at the University of Bonn from 1845 to 1848 and from 1849 to 1851. He chose as his main subject Old Testament studies. Like all researchers in the *Textwissenschaft* of the Old Testament, he compared several Semitic languages to clarify some linguistic points; in this way, he extended his interest to North African (Hamitic) languages. As a consequence, he studied in Berlin in 1848 and 1849 with the famous specialist in Egyptological research, Richard Carl Lepsius. Here Bleek had to transcribe manuscripts of southern African languages, sent mostly by missionaries, into Lepsius's phonetic alphabet. In 1851, Bleek submitted his doctoral thesis at the University of Bonn. From this time on, he propagated the hypothesis that the 'Hottentot' (*Khoekhoe*) language was typologically and genetically linked to the North African (Hamitic) languages: like the Hamitic languages, it was a gender language, differing from the Bantu languages without nominal gender. Later, it was Bleek who created the classificatory term 'Bantu-languages.'

From 1855 on, Bleek worked as an explorer- linguist in southern Africa, though he had to break off his first attempt to explore Africa from the Guinea coast because of fever. In the *salon* of the Prussian ambassador in London, C. C. J. von Bunsen, who was an aristocratic historian, a friend of Bleek's family, a promoter of Sanskrit and Oriental Studies, and a correspondent of Alexander von Humboldt, Bleek got to know Sir George Grey, governor of the Cape province (a British colony at this time) and J. W. Colenso, bishop of Natal. Colenso engaged Bleek formally to accompany him to compile a Zulu grammar, and Bleek arrived in 1855 in Natal. He had great plans for doing extended field work and thus becoming a sort of Livingstone of linguistics, but the only concrete result was a stay at the court of the famous Zulu king Mpanda. All other plans had to be abandoned due to financial and health problems.

The only institutions in the world where scientific research was professionalized and thus constantly remunerated at this time were the Prussian universities; but Bleek was never a member of the staff of a Prussian university. What helped him to survive and to carry on his work, on a more limited scale, was the patronage of Sir George. In 1856, Bleek became the curator and bibliographer of Sir George's enormous collection of documents concerning the languages and the ethnology of southern Africa, and he constantly extended this collection, which was intended to become the most complete collection of material on aboriginal languages from all over the world. So Bleek spent the rest of his life in Cape Town; but here, at least, he had the opportunity in 1858 to meet Livingstone on his way to Mozambique. In 1859, when Sir George was appointed governor of New Zealand, he donated his collection to the South African Public Library at Cape Town, with Bleek as its curator (1862). In 1870, through the influence of Sir George, Bleek's name was placed on Gladstone's *Civil List*, ensuring him a royal pension like other persons such as Charles Darwin or Charles Lyell. Only then, for the first time in his life, did he enjoy financial independence. As a bibliographer, Bleek's main work was *The library of H. E. Sir George Grey, K. C. B.* (1857–1867), but his main scientific

work was *A comparative grammar of South African languages* (1862–1869).

In his *Comparative grammar,* Bleek wanted not only to prove, by the means of the 'science of language,' the kinship between the Hottentot and the north African languages, but also to make a definitive contribution to a question already posed in Sanskrit and Oriental linguistics: what are the very first, the primitive forms of human language (after the full natural evolution of man and language), and can they be found in the Hottentot and 'Kafir' (*Zulu*) languages. An adherent of evolutionism, he was convinced that in southern Africa the most primitive state of mankind was preserved.

This was the immediate goal of his research, but he also pursued another, more distant goal: to understand the causes of the specific cultural difference between populations adhering to a primitive or natural religion and those adhering to a transcendental religion. For this son of a Protestant theologian, culture, mind, and religion were the same 'thing.' In this he refers to Max Müller, whom he probably met in Bunsen's house in London, but without agreeing with him on every point. Bleek seeks the cause of religious or mental differences in linguistic differences concerning the 'forms' and 'elements' of language, which he compares by analogy to certain nonmathematical and nonlogical sciences: to organic chemistry (phonology as the science of the 'elements' of language) and to comparative anatomy (the 'forms' as the skeleton of language). So in his main work as elsewhere, Bleek works not only as a comparative linguist, but as a linguistic researcher who has his intellectual background in Spinoza's philosophy, as transmitted among certain Lutheran theologians and elsewhere in German intellectual culture.

Bleek's debt to Spinoza's philosophy is manifest mainly in his explicitly speculative work *The origin of language*, submitted in 1853 for the Volney Prize (which he did not win), prefaced for publication in 1867 by himself and by his uncle, Ernst Haeckel, a researcher on human evolution and a Darwinist. This work advanced the thesis that there is no opposition, no essential difference between sciences and humanities, between natural sciences and the sciences of the mind (*Geisteswissenschaften*). Spinoza's philosophy implies epistemological naturalism, a continuity between man and nature. To this naturalistic conception of history were opposed the post-Kantian and Hegelian idealistic German historicism and '*Geisteswissenschaft*.'

Bleek's last great scientific enterprise was his *Bushman dictionary*, begun in about 1870 and completed by his daughter Dorothea Frances Bleek in the 1940s, published in the American Oriental Society series in 1956. His many works on Bushman tales, studied because they give access to the religion, were published in 1911 by his sister-in-law, Lucy C. Lloyd. Here, as in his other works, the languages of the 'negroes' are legitimate subjects of scientific research, not inferior to the classical languages: each 'race' has a place in the history of the evolution of man and is equally interesting. The more primitive 'races' may even be more interesting. The *Bushman dictionary* constitutes an enormous compendium of information about languages that have become in the meantime extinct.

Bleek's main hypothesis concerning the kinship of the Hottentot and the North African languages survived up to the work of the Hamburg Africanist Carl Meinhof; when he tried to prove this kinship definitively by means of comparative philology, Meinhof found that it did not exist. Comparative philology, or the science of language, was and is a modern research science capable of revising its own hypotheses. Bleek's belief in the existence of a causal relation between language and mind in the sense of the structures of religious systems is no longer accepted. Comparative research into civilizations understands the difference between primitive or natural and transcendent religions in a different way.

Dorothea Frances Bleek, born March 26, 1873, in Mowbray, Cape Colony, died June 27, 1948, in Plumstead, South Africa. The youngest daughter of W. H. I. Bleek, she was an eminent researcher in the Hottentot (*Khoekhoe*) and Bushman (*Khoisan*) languages. In 1904, she was a student of African languages in Berlin, Germany; after 1908, she concentrated on research in the Bushman languages and cultures. She was introduced to these studies by her father's sister-in-law, Lucy C. Lloyd. Miss Lloyd continued and edited the work of W. H. I. Bleek, encountering many difficulties, since she was 'only' a woman in Victorian times.

Dorothea F. Bleek continued and edited the work of both W. H. I. Bleek and Lucy C. Lloyd. From 1910 to 1930 she did extensive fieldwork among Bushman populations. The results are documented in a series of publications, the most important of which is the *Bushman dictionary*, begun by her father about 1870, continued by Lucy C. Lloyd, but mainly established by Dorothea F. Bleek and published by the American Oriental Society in 1956. She was also active in other domains, such as Bushman anthropology, for the Africa Museum in Cape Town, and the study of Bushman rock paintings. While Dorothea Bleek's father was the inventor of the term 'Bantu-languages,' the daughter established the distinction of three main regional groups of the Khoisan languages: southern, northern, and central Khoisan, with the Hottentot (Khoekhoe) language being a part of the central Khoisan group. Her father's hypothesis of a typological-genetic link between the Hottentot and the Hamitic languages is no

longer accepted, but the main classificatory result of the daughter's work still holds. From 1923 to 1948, Dorothea Bleek was Honorary Reader in the Bushman Languages at the University of Cape Town. But she refused the title of an Honorary Doctor, regarding herself simply as her father's humble disciple.

Introduction

The word *Oxbridge* is composed of a string of segments corresponding to segments at the left edge of *Oxford* and the right edge of *Cambridge*. This is a blend, and so are *vodkatini* (*vodka* + *martini*), *jazzercise* (*jazz* + *exercise*), and *maridelic* (*marijuana* + *psychedelic*). Blends (also called portmanteau words) exhibit some sort of structural fusion, in which a single word is formed from two words (and in a handful of cases from three). The byproduct of this fusion is the truncation of segmental material from the inner edges of the two words or only one of them (i.e., the material not underlined in the examples above). Note that blends refer only to cases where the inner edges are truncated. Forms in which the right edges of the two (or more) words are truncated, such as *sitcom* (*situation* + *comedy*), *modem* (*modulator* + *demodulator*), and *fortran* (*formula* + *translation*), are called clipped compounds. Blends in which only the first word undergoes truncation could also be considered a clipped compound (*mocamp* from *motor* + *camp*), especially when each word contributes only one syllable to the surface form, which is a characteristic of clipped compounds.

A blend is one word that delivers the concept of its two base words and its meaning is thus contingent on the semantic relation between the two base words. In *skinoe* (*ski* + *canoe*), the word *canoe* functions as the semantic head, since *skinoe* is a type of *canoe*. In *snazzy*, however, neither *snappy* nor *jazzy* functions as a head and the meaning of the blend is thus a hybrid of the meaning of the two (sometimes near-synonymous) base words.

The most intriguing question with respect to blends is whether their phonological structure, i.e., their size, syllable structure, and segmental makeup, is predictable on the basis of the base words (Bauer, 1983). For example, why do we get *beefalo* from *beef* and *buffalo*, rather than **beelo* or **beebuffalo*? And since the order of the base words affects the phonological shape of the blend, we may also ask why the order is not *buffalo* + *beef*, which would result in **buffabeef* or **bubeef*?

In most cases, two base words provide only one possible blend (there is a handful of cases where both orders are available, e.g., *tigon* (*tiger* + *lion*) versus *liger* (*lion* + *tiger*), *absotively* (*absolutely* + *positively*) versus *posilutely* (*positively* + *absolutely*), and *moorth* (*moon* + *earth*) versus *earthoon* (*earth* + *moon*)). Therefore, we may suspect that the formation of blends is not accidental, but rather governed by some general principles. The principles reflect two competing tendencies: (i) to truncate segments from

Introduction

The word *Oxbridge* is composed of a string of segments corresponding to segments at the left edge of *Oxford* and the right edge of *Cambridge*. This is a blend, and so are *vodkatini* (*vodka* + *martini*), *jazzercise* (*jazz* + *exercise*), and *maridelic* (*marijuana* + *psychedelic*). Blends (also called portmanteau words) exhibit some sort of structural fusion, in which a single word is formed from two words (and in a handful of cases from three). The byproduct of this fusion is the truncation of segmental material from the inner edges of the two words or only one of them (i.e., the material not underlined in the examples above). Note that blends refer only to cases where the inner edges are truncated. Forms in which the right edges of the two (or more) words are truncated, such as *sitcom* (*situation* + *comedy*), *modem* (*modulator* + *demodulator*), and *fortran* (*formula* + *translation*), are called clipped compounds. Blends in which only the first word undergoes truncation could also be considered a clipped compound (*mocamp* from *motor* + *camp*), especially when each word contributes only one syllable to the surface form, which is a characteristic of clipped compounds.

A blend is one word that delivers the concept of its two base words and its meaning is thus contingent on the semantic relation between the two base words. In *skinoe* (*ski* + *canoe*), the word *canoe* functions as the semantic head, since *skinoe* is a type of *canoe*. In *snazzy*, however, neither *snappy* nor *jazzy* functions as a head and the meaning of the blend is thus a hybrid of the meaning of the two (sometimes near-synonymous) base words.

The most intriguing question with respect to blends is whether their phonological structure, i.e., their size, syllable structure, and segmental makeup, is predictable on the basis of the base words (Bauer, 1983). For example, why do we get *beefalo* from *beef* and *buffalo*, rather than **beelo* or **beebuffalo*? And since the order of the base words affects the phonological shape of the blend, we may also ask why the order is not *buffalo* + *beef*, which would result in **buffabeef* or **bubeef*?

In most cases, two base words provide only one possible blend (there is a handful of cases where both orders are available, e.g., *tigon* (*tiger* + *lion*) versus *liger* (*lion* + *tiger*), *absotively* (*absolutely* + *positively*) versus *posilutely* (*positively* + *absolutely*), and *moorth* (*moon* + *earth*) versus *earthoon* (*earth* + *moon*)). Therefore, we may suspect that the formation of blends is not accidental, but rather governed by some general principles. The principles reflect two competing tendencies: (i) to truncate segments from

Table 1 Types of semantic relations between the base words

	Base words			*Blend*
(a)	Endocentric relation: one of the words functions as a semantic head (in bold below) and the other as a modifier			
	klan	+	**koran**	kloran 'a bible used by the members of KKK'
	education	+	**entertainment**	edutainment 'educational entertainment'
	key	+	**container**	keytainer 'a container for keys'
(b)	Exocentric relation: both words have the same semantic status, and thus none of them serves as a head			
	alphabetic	+	numeric	alphameric 'consisting of both letters and numbers'
	escalator	+	lift	escalift 'a hybrid device with the advantage of both an escalator and a lift'
	tangerine	+	lemon	tangemon 'a hybrid of tangerine and lemon'

the base in order to allow the blend to have the length a single word, preferably one of the base words, and (ii) to preserve as many segments from the base words as possible and thus maximize the semantic transparency of the blend.

The principles proposed in the following sections take English blends as the empirical basis (the data are drawn mostly from Adams (1973) and Bryant (1974)). However, these principles should be applicable to blends from other languages, though some parameter settings might be required (see Kubazuno (1990) for English and Japanese; Bat-El (1996) for Hebrew; Fradin (2000) for French; and Piñeros (2004) for Spanish).

The Semantic Relation between the Base Words

The meaning of a blend is composed of the meaning of its base words, which exhibit two types of semantic relation, endocentric and exocentric (Table 1) (see Adams (1973) and Algeo (1977) for other types of relation).

In some cases, it is not clear whether the semantic relation is endo- or exocentric. The blend *smog* (*smoke* + *fog*), for example, has two meanings, 'a mixture of fog and smoke' (exocentric) and 'an airborne pollution' (endocentric). The same is true for *brunch* (*breakfast* + *lunch*), which means either 'lunch with some characteristics of breakfast' (endocentric) or 'a mixture of breakfast and lunch' (exocentric).

Table 2 The number of syllables in a blend equals the number of syllables in Its longer base word

Blend	*Base words*
alphameric (4)	alphabetic (4) + numeric (3)
econocrat (4)	economist (4) + bureaucrat (3)
pinkermint (3)	pink (1) + peppermint (3)
plastinaut (3)	plastic (2) + astronaut (3)
portalight (3)	portable (3) + light (1)
smothercate (3)	smother (2) + suffocate (3)
tangemon (3)	tangerine (3) + lemon (2)
Texaco (3)	Texas (2) + (New) Mexico (3)
zebrule (2)	zebra (2) + mule (1)

These two types of relations also appear in compounds (Bauer, 1988; Spencer, 1991), but blends are much more permissive in this respect. Blends allow any possible combination of lexical categories, including some that do not appear in compounds (e.g., verb–verb, as in *baffound*, from *baffle* + *confound*). In addition, blends do not show preference for endo- or exocentric relation, whereas compounds are mostly endocentric. Finally, in endocentric compounds the order of the head and the modifier is fixed and this is also true for most endocentric blends in English (Kubozono, 1990), which are right-headed, like compounds. In Hebrew, however, whose compounds are left-headed, blends can be either right- or left-headed (Bat-El, 1996).

The Size of the Blend

The formation of a blend aims toward two competing goals. On the one hand, it must have the structure of a single word, unlike compounds, in which the two base words are accessible. For this purpose, the blend often adopts the number of syllables in one of its base words, thus truncating some segmental material. On the other hand, a blend must preserve as much of the structure from its base words as possible. To accommodate the first goal and maximize the fulfillment of the second, the number of syllables in a blend is often identical to the number of syllables in the longer base word (number of syllables in parentheses) (see Table 2).

By adopting the number of syllables from the longer rather than the shorter base word, the blend obtains the structure of one word and maximizes its size. Maximization facilitates the semantic recoverability of the base words, since the more segmental material from the base words there is, the easier it is to identify them.

Table 3 Segmental maximization also determines the order of the base words in exocentric blends

A + B – Maximizing order		*B + A – Nonmaximizing order*	
blurt	blow + spurt	*spow	spurt + blow
glaze	glare + gaze	*gare	gaze + glare
smash	smack + mash	*mack	mash + smack
snazzy	snappy + jazzy	*jappy	jazzy + snappy
swacket	sweater + jacket	*jater	jacket + sweater
camcorder	camera + recorder	*recmera	recorder + camera
citrange	citrus + orange	*ortrus	orange + citrus

There are, however, some exceptions, for example, *plumcot* (2) from *plum* (1) + *apricot* (3); *brunch* (1) from *breakfast* (2) + *lunch* (1); *goon* (1) from *gorilla* (3) + *baboon* (2); and *bionic* (3) from *biology* (4) and *electronic* (4). It should be noted that Kubozono (1990) claims that the number of syllables in a blend is identical to the number of syllables in the rightmost word, but some of the exceptions above (*bionic*, *plumcot*, *goon*) do not obey this generalization either.

When the two base words have an identical number of syllables, the number of segments often plays a role. Here again, in order to facilitate recoverability, blends tend to preserve as many base segments as possible, given the restriction on the number of syllables noted above. This tendency affects the order of the base words in exocentric blends, in which the order is not determined by a head–modifier relation. For example, a word with a complex onset will be first and a word with a complex coda second. That is, the order of the base words is determined by the principle requiring the maximization of the number of segments (see Table 3).

In some cases, segmental maximization is blocked by the phonotactics of the language. For example, from *bang + smash* we obtain *bash*, rather than the segmentally richer form **smang* (*smash + bang*), since English does not allow monomorphemic sCVC words where the two Cs are nasal (Davis, 1988). The fact that blends are subject to stem phonotactics supports the claim that blends are monomorphemic despite their polymorphemic base.

Figure 1 Segmental overlap.

The Switch Point at Segmental Overlap

Contrary to the principle given above, there are blends consisting of more, and sometimes fewer, syllables than the longer base word. In many cases, this is due to the presence of one or more segments (shown in boldface below) shared by the two base words. In such cases, the position of the shared segments determines the 'switch point' of the blend, i.e., where the first base word ends and the second begins (see Table 4).

The selection of the position of the shared segment(s) as the switch point contributes to segmental maximization. The shared segments overlap and thus correspond to segments in both base words, allowing more segments from each word to be preserved in the blend. For example, *diabesity* preserves *diabe* from *diabetes* and ***besity*** from *obesity*. Notice that in *Chicagorilla* all segments of the base words appear in the blend. Of course, the more segments of the base words in the blend there are, the more transparent the base words are (see Figure 1).

Segmental overlap by the shared segments may also determine the order of the base words in exocentric blends (in which the order of the base words is not determined by the head–modifier relation) (see Table 5). There are cases where only one order of the two words allows a segmental overlap of the shared segments.

The requirement to have the switch point at the segmental overlap usually overrides the requirement to maintain the same number of syllables in the blend as in the longer base word (see Table 4). In a few cases, such as *Bisquick* 'quick biscuit.' it also overrides the order imposed by the head–modifier relation (Algeo, 1977). However, there are plenty of blends that meet all the requirements (see Table 6).

Table 4 The switch point at the overlap of the identical segments shared by the base words

Blend	*Base words*	*Expected number of syllables*
Chica**go**rilla (5)	Chica**go** (3) + **go**rilla (3)	*Chicalla (3)
cine**ma**gpie (4)	cine**ma** (3) + **ma**gpie (2)	*cinegpie (3)
croi**ssan**dwich (3)	croi**ssant** (2) + **san**dwich (2)	*croiwich (2)
dia**be**sity (5)	dia**be**tes (4) + o**be**sity (4)	*diasity (4)
esca**li**ft (3)	escalator (4) + **li**ft (1)	*escalalift (4)
lu**mi**st (2)	lu**mi**nous (3) + **mi**st (1)	*lumimist (3)
op**t**ronic (3)	op**t**ic (2) + ele**ct**ronic (4)	*optictronic (4)
transis**t**ena (4)	transis**t**or (3) + an**t**enna (3)	*transisna (3)

Table 5 The switch point at the shared segments determines the order of the base words

A + B – Overlap of shared segment(s)		*B + A – No overlap of shared segment(s)*	
bee**f** + bu**ff**alo	bee**f**alo	buffalo + beef	*bu**ff**abee**f**
cla**m** + to**m**ato	cla**m**ato	tomato + clam	*to**m**acla**m**
windo**w** + **w**all	windo**w**all	wall + window	***w**allindo**w**
po**l**o + **l**acrosse	po**l**ocrosse	lacrosse + polo	***l**acro**l**o
ova**l** + **ll**iptic	ova**ll**iptic	elliptic + oval	***ll**ipta**l**

Table 6 Blends that meet all the requirements

Blend	*Base words*
adv**er**tainment (4)	adv**er**tisement **(4)** + ent**er**tainment **(4)**
dy**n**etic (3)	dy**n**amic **(3)** + mag**n**etic (4)
nar**co**ma (3)	nar**co**tic **(3)** + **co**ma (2)
sh**am**ateur (3)	sh**am**e (1) + **am**ateur **(3)**
sn**ob**lem (2)	sn**ob** (1) + pr**ob**lem **(2)**
veloci**t**one (4)	veloci**t**y **(4)** + **t**one (1)
we**st**ralia (4)	we**st** (1) + Au**st**ralia **(4)**

The Switch Point at Syllable Constituency

When the two base words do not have a shared segment, the syllable structure plays a role in determining the switch point. In monosyllabic blends, derived from two monosyllabic base words, the switch point (marked with •) must be at the onset–nucleus boundary (see Table 7). The question is: which word contributes its nucleus, the first (CV•C) or the second (C•VC)? It appears that there is a preference for the latter option; that is, the first word contributes only its onset and the second contributes its nucleus and coda, i.e., its entire rhyme (Kubozono, 1990).

Since the onset and the nucleus are perceptually more salient than the coda, this division allows the blend to preserve one perceptually salient element from each base word, i.e., the onset from the first word and the nucleus from the second. There are, however, several exceptions, some of which are due to lexical blocking, for example, *slosh* (**slush* – lexical blocking) from *slop + slush; boost (*boist) from boom + hoist; and moorth (*mearth – lexical blocking) from moon + earth*.

In polysyllabic blends, there is a preference for the switch point to be at the syllable boundary in the blend, which allows maximization of the segmental material (see Table 8). That is, *camera + recorder* yields *cam•corder* rather than **cam•order*. However, there is a restriction on the type of coda–onset contact at the switch point. This restriction, known as the Syllable Contact Law (Vennemann, 1988), requires

Table 7 The switch point in monosyllabic blends

Base words	*C•VC* *W1 word onset – W2 nucleus + coda*	*CV•C* *W1 onset + nucleus – W2 word coda*
blank + beep	bleep	*blap
blow + spurt	blurt	*blort
smoke + haze	smaze	*smoze
Swiss + watch	swatch	*switch
bump + conk	bonk	*bunk
spiced + ham	spam	*spim
snazzy + ritzy	snitzy	*snatzy

the coda to be more sonorous than the adjacent onset. When this requirement is not met, or when the distance in sonority between the coda and the onset is insufficient, the switch point is at the onset–nucleus boundary of the second word (as in monosyllabic blends). Thus, *rocket + balloon* does not yield **rock•lloon*, due to the offending *kl* contact and therefore the surface form is *rock•oon*.

Conclusion

The discussion above suggests that the formation of blends is governed by several principles that together determine the order of the base words, the size of the blend, and the switch point.

The order of the base words is determined by the head–modifier relation, requiring the head to follow its modifier (see Table 1a). In the absence of such a relation, i.e., in an exocentric relation, the phonology plays a role. When the two base words have one or more shared segments, the order of the base words is such that these segments overlap (Table 6). In the absence of shared segments, segmental maximization determines the order (Table 3).

The number of syllables in the blend is also determined by the overlap of the shared segments, which demarcate the switch point (Table 4). In the absence of a shared segment, the number of syllables in the blend is identical to that in the longer base word (Table 2). If the two base words have an identical number of syllables, then segmental maximization plays a role (Table 3).

The switch point is determined by the shared segments, which overlap in the blend (Tables 4 and 5). In the absence of a shared segment, the switch point is determined by syllabic constituency. In monosyllabic blends, the switch point is at the onset–nucleus boundary, such that the blend preserves the onset of the first word and the nucleus plus the coda of the second (Table 7). In polysyllabic blends, the switch point is at the syllable boundary, in cases where the

Table 8 The switch point in polysyllabic blends

Base words	*Switch point at syllable boundary*	*Switch point at onset–nucleus boundary*
camera + recorder	cam•corder	*cam•order
color + asbestos	color•bestos	*color•estos
proletariat + cult	prolet•cult	*prolet•ult
smother + suffocate	smother•cate	*smother•ate
sun + reflector	sun•flector	*sun•ector
rudder + elevator	rudder•vator	*radder•ator
brush + terrific	*brush•riffic	brush•erific
cattle + buffalo	*cat•ffalo	catt•alo
earth + moon	*earth•moon	earth•oon
hurricane + balloon	*hurric•lloon	hurric•oon
molecule + organism	*molec•nism	molec•ism
pink + peppermint	*pink•permint	pink•ermint
rocket + balloon	*rock•lloon	rock•oon
slanting + perpendicular	*slant•pendicular	slant•endicular
zebra + mule	*zeb•mule	zebr•ule

coda–onset contact respects the Syllable Contact Law; otherwise, it is at the onset–nucleus boundary (Table 8).

The principles governing the formation of blends are not always obeyed. The few exceptions found reflect a natural state of affairs in derivational morphology, where exceptions are often due to some extragrammatical factors. There is, however, intergrammatical (nonexceptional) violation of principles, in cases of conflict (e.g., switch point at syllable constituency and the Syllable Contact Law (Table 8). In such cases, one principle has a (language-specific) priority over the other, allowing a deterministic selection of the surface form. A model of conflicting principles and violation under conflict is provided by Optimality Theory (Prince and Smolensky, 1993).

Blessings

B G Szuchewycz

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 370–371, © 1994, Elsevier Ltd.

Blessings are utterances associated primarily with the sphere of religious activity, but they also appear with varying frequency in the politeness formulas and parenthetical expressions of everyday conversation. In both contexts, the dominant linguistic feature is the use of formal and/or formulaic language. Blessings, particularly in religious ritual, may also be accompanied by specific nonlinguistic features including gestures (e.g., laying on of hands, the sign of the cross) and the use of special objects (e.g., a crucifix) or substances (e.g., water, oil). Concern with such patterned relationships between linguistic form, on the one hand, and social context and function, on the other, is central to the study of the role of language in social life.

Linguistically, blessings (and their opposite, curses) are marked by the use of a special language, which may be either a highly formal or archaic variety of the dominant language (e.g., Classical Arabic) or a different code entirely (e.g., Latin). In addition to their specific content, linguistic features such as repetition, special form (e.g., parallel couplets), special prosody (e.g., chant), and fixity of pattern distinguish blessings from other types of speech and contribute to their formal and formulaic character.

The concept of blessing in Jewish, Christian, and Muslim thought, as in many other traditions, is concerned with the bestowal of divine favor or benediction through the utterance of prescribed words. As such, blessings represent an example of the belief in the magical power of words, other manifestations of which include the use of spells, incantations, and curses.

As an aspect of religious behavior, blessings are associated with essential components of public and private ritual activity. They are performed by religious specialists in situations of communal worship as, for example, in rituals where a general blessing of those present marks the end of the event. Blessings are also used by nonspecialists to solemnize, sacralize, and/or mark the boundaries of social events. In traditional Judaism, for example, *brokhe* 'blessings' include short formulaic expressions used in a wide variety of situations as well as longer texts associated with domestic ceremonies (e.g., a grace after a meal) and specific occasions or rites (e.g., Passover, weddings, funerals). Common to all is a fixity of form and the strict association of specific texts to specific occasions.

In the Bible, the Hebrew root *brk* 'blessing' is associated with a number of meanings. A blessing may be an expression of praise or adoration of God, a divine bestowal of spiritual, material, or social prosperity, or an act of consecration that renders objects holy. The Greek *eulogia* of the New Testament stresses the spiritual benefits that are obtainable through Christ, the gospels, and the institution of the church (e.g., liturgical blessings). Each instance – praise, benediction, and consecration – represents a social and religious act accomplished through the use of a highly conventionalized form of language.

Blessings often function as 'performatives.' A performative is a speech act that, when uttered, alters some state of affairs in the world. Under the appropriate conditions, if a minister states, 'I pronounce you man and wife,' then a marriage has been socially established. If someone says, 'I promise,' then a promise has been made. Similarly, blessings function as religious performatives, in that the utterance of the requisite expression precipitates a change in spiritual state.

Mastery of the linguistic formulas, however, is not sufficient for the successful realization of blessings (and other performatives). The existence of an extralinguistic institution (e.g., family, descent group, religious institution) with differentiated social roles and statuses for the blessor and blessee(s) is a necessary precondition to an authentic and valid performance of the act. Only certain individuals may pronounce a couple man and wife and create a legally binding marriage. The same is true of blessings.

Catholicism, for example, distinguishes those blessings exchanged between lay persons, the spiritual value of which depends on the personal sanctity of the blessor, from liturgical blessings, which carry the force of the ecclesiastical institution. As the institution itself is hierarchically organized, so too is the right to confer particular blessings. Some may be performed by the pontiff alone, some only by a bishop, others by a parish priest, and yet others by a member of a religious order. Similarly, and in a very different ethnographic context, among the Merina of Madagascar the *tsodrano* is a ritual blessing in which seniors act as intermediaries between ancestors and those being blessed, their juniors. A father bestows fertility and wealth on his son through a ceremonial public blessing that transfers to the son the power of the ancestors in a ritual stressing the continuity and reproduction of the descent group.

Like other performatives, blessings operate properly only within a context of social and cultural norms and institutions, which are necessary for their realization and to legitimate and maintain their force.

Much of human face-to-face interaction is ritualistic in nature, and it has been argued that the use of formalized and prepatterned linguistic and nonlinguistic behavior in everyday life is evidence of a link between interpersonal rituals of politeness, on the one hand, and ritual behavior in the sacred sphere, on the other (Brown and Levinson, 1987). Blessings are an example of a specific linguistic routine common to both.

In nonreligious contexts, blessings are evident in the politeness formulas and parenthetical expressions of everyday conversation: for example, the English 'Bless you!' as a conventional response to a sneeze. Similarly, in greetings, thanks, and leave-takings, blessings are exchanged between interlocutors and, although they may literally express a wish for supernatural benefits, their primary communicative function is as highly conventionalized markers of social and/or interactional status. In both their religious and secular uses, blessings thus function as expressions of solidarity, approval, and good will.

When embedded parenthetically within larger sentences or longer texts, blessings may also function as semantically and interactionally significant units. In oral narratives, the use of a blessing (or curse) serves to communicate directly the emotional state or attitude of the speaker toward the topic, providing a means of internal evaluation and signaling speaker involvement in the text. Yiddish speakers, for example, make extensive use of a large set of fixed expressions, many of which are blessings, for just such a purpose (Matisoff, 1979).

Bernard Bloch studied English and German (A.B. 1928, M.A. 1929) at the University of Kansas, where his father Albert taught art. Continuing at Northwestern University, he took a course in linguistics with Werner F. Leopold in 1931. That same year, he was chosen as a field worker on the *Linguistic Atlas of New England*, directed by Hans Kurath. In 1933 he followed Kurath and the *Atlas* project to Brown University. Bernard (and his wife Julia) did much exacting editorial work on the *Atlas*. He completed his Ph.D. at Brown in 1935, in English and linguistics, teaching English and modern languages there until moving to Yale's linguistics department in 1943.

His character, his intelligent and disciplined scholarship, and his extraordinary writing and editorial skills soon made Bloch an influential presence within the Linguistic Society of America. In 1940 he became the second editor of its journal, *Language*, and continued as editor until his death. His insistence on clarifying each point in a manuscript made it no idle jest when he later remarked that he had published many papers each year, most of them under famous pseudonyms.

Bloch and Leonard Bloomfield shared intensely demanding applied linguistic work during the war. Although he was Bloomfield's junior colleague at Yale for only a few years, Bloomfield's influence on him was profound (Bloch, 1949). The austere modernist intellectual architecture of their work is very similar (Bloch, 1948); Bloch's writing is much friendlier to readers. His wartime work on Japanese was published as a basic course, and later in a series of descriptive publications capped by the article on phonemics (Bloch, 1950), all meant to illustrate the application of the principles of linguistic description. His 'English verb inflection' (Bloch, 1947) is an exemplar of distributionalist structural morphology, compactly presenting a remarkably complete solution together with its rationale.

Bloch was an extraordinary teacher, delivering beautifully composed informal lectures as lightly as one might carry on a conversation, sustaining an easy exchange of statements, questions, and answers. He would sometimes read a few sentences from some unidentified publication, extracts chosen for their comic value in illustrating various rhetorical or

Jules Bloch was born in Paris on May 1, 1880, and attended the Lycée Louis-le-Grand as a scholarship student. He completed his Licence ès Lettres, and subsequently became a graduate student in Sanskrit and ancient literature and culture in the École des Hautes Études at the University of Paris.

In 1905, he undertook his first major academic project toward the end of his graduate training. He and two other researchers were given the task of translating large portions of the monumental three-volume *Kurze vergleichende Grammatik der indogermanischen Sprachen* (1902–1904) by the Indo-European linguists Karl Brugmann and Berthold Delbrück. Bloch then helped edit an abridged version of the translated text, *Abrégé de grammaire comparée des langues indo-européennes* (1905), supervised by Antoine Meillet, a specialist in Indo-European linguistics at the École des Hautes Études.

In 1906, Bloch published his own diploma thesis on Sanskrit, *La phrase nominale en sanscrit,* and went on to pursue the study of Hindi and Tamil. He performed research in the field in India, later moving to Vietnam, where he served on the faculty of the École Française d'Extrême Orient in Hanoi.

In 1914, Bloch completed and submitted his doctoral thesis, *La formation de la langue marathe,* a diachronic study of Marathi; for this he received the Prix Volney, a prestigious linguistic prize awarded annually by the Institut de France since 1822. His research was soon interrupted by infantry service for four years in World War I, during which he rose from sergeant to lieutenant and was awarded the Croix de Guerre for bravery.

Bloch returned to the École des Hautes Études in 1919, and was made Director of Studies there in 1920. He also served as Professor of Sanskrit at the Sorbonne, and in 1937 became a professor at the Collège de France, where he remained until his retirement in 1951. Bloch also served as the secretary of the Société Linguistique in France for close to a quarter of a century (1920–1944), keeping in close touch with other leading linguists in Europe and India throughout his career. He also guided and assisted many Indian students in Paris, and a number of them subsequently distinguished themselves in the field of Indo-European linguistic studies.

Bloch developed proficiency in and did research on a number of languages of India, ancient and modern, including Sanskrit, Pali, Vedic language, Hindi, and Marathi, an Indo-European language spoken by over 65 000 000 people. Bloch also did research on Tamil, a Dravidian language spoken by more than 50 000 000 people in India, Sri Lanka, Malaysia, and elsewhere in Southeast Asia. His *Structure grammaticale des langues dravidiennes* (1946) was one of the first modern linguistic studies of the Dravidian family of languages.

Bloch also began a project to translate the Pali Buddhist Canon, with his inaugural volume of the *Canon bouddhique Pāli* (1949), but this work was unfortunately not continued by others. In the last year of his life, Bloch published one of the first modern scholarly studies of the Romany-speaking people, *Les Tsiganes* (1953). Romany, spoken by an estimated 2 000 000 people, is an Indo-European language with origins in India and grammatical affinities with Sanskrit. Bloch was one of the first Indo-European

factual blunders. It transpired that all of these examples were drawn from his own published work. Students in his introductory course wrote a two-page essay each week on a topic relevant to the readings. These were returned at the next class, edited with the same fierce devotion to clarity and professionalism that he brought to all papers sent to the editor of *Language*. Bloomfield, Leonard (1887–1949)

J G Fought, Diamond Bar, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Leonard Bloomfield was born in Chicago; his family moved to rural Wisconsin when he was nine. He graduated from Harvard in 1906. When he sought an assistantship in German at the University of Wisconsin that summer, he met the Germanist Eduard Prokosch (1876–1938), who introduced him to linguistics. Bloomfield took his doctorate in Germanic philology at the University of Chicago in 1909. He taught German (German, Standard) for one year at the University of Cincinnati as an instructor, later moving to the University of Illinois. In 1913–1914 he studied with the Neogrammarians Karl Brugmann, August Leskien, and Hermann Oldenberg at the Universities of Leipzig and Göttingen and then returned to Illinois, only then becoming an assistant professor, his rank until 1921. During his stay at Illinois he also published his first work on a non-Indo-European language, *Tagalog texts with grammatical analysis* (1917), whose conception and organization were very probably influenced by his friend Franz Boas (1858–1942). In 1919, he began his work on the Algonquian languages (1928, 1930, 1934, 1946), some of which was edited and published posthumously (1957, 1962, 1975).

In 1921, he moved to Ohio State University as a full professor. While there, he and the behavioral psychologist Albert Paul Weiss (1879–1931) became friends, and Bloomfield adopted some of the idiom of that approach, though its role in his work has been greatly exaggerated. There Bloomfield also took part, with George Melville Bolling (1871–1963), in founding the Linguistic Society of America in 1925. Esper (1968) was an invaluable eyewitness report on this period in Bloomfield's career. In 1927, Bloomfield returned to the University of Chicago, where he and Edward Sapir (1884–1939) were briefly colleagues. His years at the University of Chicago seem to have been the most pleasant and productive of his working life. In 1940 he went to Yale, as Sterling Professor, the successor of Prokosch and to some degree also of Sapir. Bloomfield led the linguistics program and took an active role in war-related work on practical language-learning materials, writing and editing a number of manuals. A stroke ended his working life in 1946; he died in 1949.

His family life was darkened by tragedies. Bernard Bloch, who knew and admired him, described his personality as "not strongly magnetic" (1949: 91). Anecdotes show his readiness to use highly refined sarcasm in dealing with critics, colleagues, and students alike. For an extended example, see Bloomfield, 1944; in a more typical instance, he claimed that his introductory textbook *Language* (1933) could be understood by any bright high-school student. This remark has often been cited as evidence of Bloomfield's innocence by scholars who have struggled with this formidable book. It is not.

He supervised only a handful of dissertations, and he sometimes tried to discourage students from specializing in linguistics. It was through his publications,

linguists to undertake the systematic study of Romany language and culture.

There Bloomfield also took part, with George Melville Bolling (1871–1963), in founding the Linguistic Society of America in 1925. Esper (1968) was an invaluable eyewitness report on this period in Bloomfield's career. In 1927, Bloomfield returned to the University of Chicago, where he and Edward Sapir (1884–1939) were briefly colleagues. His years at the University of Chicago seem to have been the most pleasant and productive of his working life. In 1940 he went to Yale, as Sterling Professor, the successor of Prokosch and to some degree also of Sapir. Bloomfield led the linguistics program and took an active role in war-related work on practical language-learning materials, writing and editing a number of manuals. A stroke ended his working life in 1946; he died in 1949.

His family life was darkened by tragedies. Bernard Bloch, who knew and admired him, described his personality as "not strongly magnetic" (1949: 91). Anecdotes show his readiness to use highly refined sarcasm in dealing with critics, colleagues, and students alike. For an extended example, see Bloomfield, 1944; in a more typical instance, he claimed that his introductory textbook *Language* (1933) could be understood by any bright high-school student. This remark has often been cited as evidence of Bloomfield's innocence by scholars who have struggled with this formidable book. It is not.

He supervised only a handful of dissertations, and he sometimes tried to discourage students from specializing in linguistics. It was through his publications,

especially *Language*, that he shaped American descriptive linguistics as a discipline during its structuralist period. Bloomfield began as a Germanist and Indo-Europeanist in the Neogrammarian tradition. These disciplines, and his rigorous cast of mind, provided the foundation for his austere approach to language description. The contrastive comparison of linguistic forms through the construction of textual concordances, the logic of textual variants, and many other analytical techniques and concepts of the classical comparative method, all became basic tools of descriptive and pedagogical applications of linguistics. Bloomfield's *Outline guide for the practical study of foreign languages* (1942) described this toolkit and explained its use. His method was based on the notion of the linguistic sign; it called for comparing linguistic forms that are partly alike and partly different, and then looking for other examples of each part so as to understand how they are alike and how they are different in form and function. In a letter to Truman Michelson written in 1919, Bloomfield, then 32, had already condensed his method of analysis into one sentence: "No preconceptions; find out which sound variations are distinctive (as to meaning) and then analyze morphology and syntax by putting together everything that is alike" (Hockett, 1987: 41). When compiling a descriptive grammar, however, Bloomfield selected among variants in his data to build and then describe a community norm of usage. Such a norm was implicit in his account of usage differences among Menomini speakers (1927); the details of its construction were brilliantly illuminated by Goddard (1987).

Blumer, Herbert (1900–1987)

N Denzin, University of Illinois at Urbana–Champaign, Urbana, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Herbert Blumer is the founding father of the unique social psychological perspective called 'symbolic interactionism.' The foremost student of George Herbert Mead (*see* **Mead, George Herbert (1863–1931)**), he translated Mead's philosophy into a theory of self, society, and interaction that has come to be known as the 'symbolic interactionist perspective' in contemporary U.S. sociology.

Blumer received his bachelor's and master's degrees from the University of Missouri in 1921 and 1922, respectively. He taught there until 1925, when he left to enter the doctoral program of the department of sociology at the University of Chicago, where he received his Ph.D. in 1928. He became an instructor in sociology at Chicago in 1925, was an associate professor from 1931 to 1947, and was a professor from 1947 to 1952. When Mead died in 1931, Blumer took over his social psychology course. From 1930 to 1935, Blumer was secretary–treasurer of the American Sociological Association and was elected president in 1955. In 1954, he was elected president of the Society for the Study of Social Problems. He also served as president of the Pacific Sociological Association and as vice president of the International Sociological Association. From 1941 to 1952, he was editor of the *American Journal of Sociology*. During World War II, he served as liaison officer between the Office of War Information and the Bureau of Economic Warfare and as a public panel chairman of the War Labor Board. He taught at the University of Chicago from 1925 to 1952. In 1952, he went as chair to the Department of Sociology at the University of California at Berkeley, where he remained as a faculty member until his death in 1987.

Blumer was the author of approximately 60 articles, dozens of book reviews (in the *American Journal of Sociology*), two monographs [*The rationale of labor–management relations* (1958), and *The world of youthful drug use* (1967)], at least three review essays, three obituaries (Louis Wirth, Ernest Burgess, and Joseph Lohman), and four books [*Movies and conduct* (1933), *Movies, delinquency, and crime* (with D. M. Hauser, 1933), *Critiques of research in the social sciences, I. An appraisal of Thomas and Znaniecki's The Polish Peasant in Europe and America* (1939), and *Symbolic interactionism* (1969)]. Posthumous publications include a collection of his papers on *Industrialization as an agent of social change: a critical analysis*, as well as *The collected papers of Herbert Blumer: George Herbert Mead and human conduct* and *Selected works of Herbert Blumer: a public philosophy for mass society.*

Blumer is remembered for his athletic prowess, his warmth as a person, his capacity as a sympathetic and understanding listener, and his acute memory and critical mind. He was a powerful and effective teacher of several generations of students who "found themselves and their careers while sitting in his classes" (Shibutani, 1970: viii).

Blumer's impact on U.S. sociology has been substantial. A loyal opponent of functionalism, positivism in sociology, and behavioral and cognitive psychology, he long championed the interpretive, naturalistic approach to human experience, social theory, and social research. Many of the ideas he put forth early in his career have since, as Shibutani noted, become generally accepted. His studies of the movies, fashion, collective behavior, racism and prejudice, the industrialization process, and social problems have become sociological classics and models of research for other scholars. As the chief systematizer of the sociological implications of Mead's thought, his writings on symbolic interaction have served to define this perspective within the international sociological community.

Blumer's sociology involved the following assumptions. Human beings act toward things on the basis of the meanings things have for them. Meanings arise out of, and are modified in, the process of social interaction. Society consists of the joint interactions of individuals. These joint actions describe recurrent patterns of collective activity, complex networks of institutional relations, and historical processes and forces. The proper study of society is at the intergroup, interactional level. Society is a framework for the operation of social, symbolic, economic, political, religious, kinship, and legal interactions. The notion of structure as process is central to Blumer's argument. Social structures are composed of interacting units "caught up in the interplay of opposing processes of persistence and change" (Morrione, 2004: xvi). Social reality is situated in these sites of interaction.

Blumer put in motion a methodological project that assumed an obdurate natural social world that could be studied scientifically – that is, mapped, reproduced, and made sense of through the careful work of the naturalistic researcher who gets close to the phenomenon under investigation. He sought a processual, interpretive social science that would utilize sensitizing concepts grounded in subjective

human experience. The empirical materials of this science would be valid, reliable, and permit the testing of hypotheses and the formulation of theoretical generalizations. Interpretive theory would confront the obdurate features of human group life and be shaped around the previously mentioned kinds of materials.

When the Society for the Study of Symbolic Interaction formed in 1974, Blumer was an immediate supporter. His impact on symbolic interactionism has been permanently recognized by the society with its annual Herbert Blumer Award, which is given to the outstanding graduate student paper best representing the tradition associated with Blumer's scholarship.

Franz Boas was born in Minden, Germany to a family of merchants. He graduated from the University of Kiel (Ph.D., 1881), specializing in psychophysics and geography. His first field work was conducted in Baffin Land in 1883; apparently this is when the focus of his interests began to shift from geography to anthropology. He came to the United States in 1886, working for a time at assorted jobs, including teaching, and managing anthropology exhibits at the Chicago World's Fair (1892–1895). In these years he also began his long examination of Kwakiutl, Tsimshian, and other Northwest Coast languages and cultures.

In 1899 he secured an appointment at Columbia University, an affiliation he retained for the rest of his life. He was a master of administration and fund raising. From his secure academic position, he soon made Columbia the source from which the professionalization of American anthropology would spread, shifting its focus from museums of artifacts to academic and field research, with linguistics as a core discipline. He strove always to reorient the field away from racism, whether overt or tacit.

As the developer and impresario of modern American anthropology and the mentor of many of its leading figures, he made an immensely significant contribution to American linguistics. Further, as a linguist in his own right, his contribution was highly respectable. Boas was self-taught in linguistics. He was more successful in establishing standards for linguistic field work than in re-inventing historical and comparative linguistics as a tool of culture history. His background in perceptual psychology led him to publish (1889) an insight into naïve impressions of foreign language sounds that is a very early and independent expression of what became the phonemic principle. The magnitude of his overall contribution to the development of field linguistics and the study of Native American languages, even after making allowances for the personal contributions of Edward Sapir, his brilliant student, and Leonard Bloomfield, his friend, is only slightly exaggerated in Bloomfield's memorial statement (1943: 198): "Boas amassed a tremendous body of observation, including much carefully recorded text, and forged, almost single-handed, the tools of phonetic and structural description."

Body Language as Human Semiosis

Body language belongs to the sphere of anthroposemiosis, the object of anthroposemiotics (*see* **Anthroposemiotics**). In fact, the term 'language' in today's semiotics is specific to human semiosis (i.e., human sign behavior).

Following Charles Morris's and Thomas Sebeok's terminological specifications, semiotics describes sign behavior with general reference to the organism (i.e., it identifies semiosis and life), and distinguishes between 'signs in human animals' and 'signs in nonhuman animals,' reserving the term language as a special term for the former. In others words, language is specific to man as a semiotic animal – that is, as a living being not only able to use signs (capable of semiosis) but also able to reflect on signs through signs (capable of semiotics). In this acceptation, language is not verbal language alone: Language refers to both verbal and nonverbal human signs. In this view – that is, from a semiotic and not a linguistic perspective (pertaining to linguistics) – language is not reduced to speech but speech is a specification of language. Language is acoustic language as much as the gestural or the tactile, etc., depending on the kind of sign vehicle that intervenes, which is not necessarily limited to the verbal in a strict sense. Following Morris (1946/1971a: 112–114), there are five criteria for the definition of language:

1. Language is composed of a plurality of signs.
2. In a language each sign has a signification common to a number of interpretants: this is linguistic signification, common to members of the interpreter-family, whereas there may, of course, be differences of signification for individual interpreters, but such differences are not then regarded as linguistic.
3. The signs constituting a language must be 'comsigns' – that is, producible by the members of the interpreter-family. Comsigns are either activities of the organisms (e.g., gestures) or the products of such activities (e.g., sounds, traces left on a material medium, or constructed objects).
4. The signs that constitute a language are plurisituational signs – that is, signs with a relative constancy of signification in every situation in which a sign of the sign-family in question appears.
5. The signs in a language must constitute a system of interconnected signs combinable in some ways and not in others in order to form a variety of complex sign-processes.

If language is considered as synonymous with 'communication,' animals no doubt also possess language. If, on the contrary, language is distinguished from communication and determined by the five criteria mentioned previously, then animals certainly do not have language, although they do communicate. Even if some of the conditions that enable us to speak of language would seem to occur in animals, they do not occur together.

On this subject, the following statement by Morris (1946/1971a: 130) seems important:

> But even if these conditions were met [i.e., if all the other requirements were met in nonhuman animal communication], the fifth requirement is a harder hurdle. For though animal signs may be interconnected, and interconnected in such a way that animals may be said to infer, there is no evidence that these signs are combined by animals which produce them according to limitations of combinations necessary for the signs to form a language system. Such considerations strongly favor the hypothesis that language – as here defined – is unique to man.

Body Language as Human Semiosis

Body language belongs to the sphere of anthroposemiosis, the object of anthroposemiotics (*see* **Anthroposemiotics**). In fact, the term 'language' in today's semiotics is specific to human semiosis (i.e., human sign behavior).

Following Charles Morris's and Thomas Sebeok's terminological specifications, semiotics describes sign behavior with general reference to the organism (i.e., it identifies semiosis and life), and distinguishes between 'signs in human animals' and 'signs in nonhuman animals,' reserving the term language as a special term for the former. In others words, language is specific to man as a semiotic animal – that is, as a living being not only able to use signs (capable of semiosis) but also able to reflect on signs through signs (capable of semiotics). In this acceptation, language is not verbal language alone: Language refers to both verbal and nonverbal human signs. In this view – that is, from a semiotic and not a linguistic perspective (pertaining to linguistics) – language is not reduced to speech but speech is a specification of language. Language is acoustic language as much as the gestural or the tactile, etc., depending on the kind of sign vehicle that intervenes, which is not necessarily limited to the verbal in a strict sense. Following Morris (1946/1971a: 112–114), there are five criteria for the definition of language:

1. Language is composed of a plurality of signs.
2. In a language each sign has a signification common to a number of interpretants: this is linguistic signification, common to members of the interpreter-family, whereas there may, of course, be differences of signification for individual interpreters, but such differences are not then regarded as linguistic.
3. The signs constituting a language must be 'comsigns' – that is, producible by the members of the interpreter-family. Comsigns are either activities of the organisms (e.g., gestures) or the products of such activities (e.g., sounds, traces left on a material medium, or constructed objects).
4. The signs that constitute a language are plurisituational signs – that is, signs with a relative constancy of signification in every situation in which a sign of the sign-family in question appears.
5. The signs in a language must constitute a system of interconnected signs combinable in some ways and not in others in order to form a variety of complex sign-processes.

If language is considered as synonymous with 'communication,' animals no doubt also possess language. If, on the contrary, language is distinguished from communication and determined by the five criteria mentioned previously, then animals certainly do not have language, although they do communicate. Even if some of the conditions that enable us to speak of language would seem to occur in animals, they do not occur together.

On this subject, the following statement by Morris (1946/1971a: 130) seems important:

> But even if these conditions were met [i.e., if all the other requirements were met in nonhuman animal communication], the fifth requirement is a harder hurdle. For though animal signs may be interconnected, and interconnected in such a way that animals may be said to infer, there is no evidence that these signs are combined by animals which produce them according to limitations of combinations necessary for the signs to form a language system. Such considerations strongly favor the hypothesis that language – as here defined – is unique to man.

This means that by comparison with animal signs, human language is characterized by the fact that its signs can be combined to form compound signs. It would seem, therefore, that in the last analysis, this 'capacity for combination' is the most distinctive element. This conception is very close to Sebeok's when he states that language (he too distinguishing it from the communicative function) is characterized by 'syntax' – that is, the possibility of using a finite number of signs to produce an infinite number of combinations through recourse to given rules.

Body language includes different sign systems. Common to these sign systems is their foundation in language intended as a specific human modeling device (Sebeok, 1991, 2001b).

All animal species have models to construct their world, and language is the model belonging to human beings. However, the distinctive feature of language with respect to other zoosemiotic systems (although this feature is present in endosemiotic systems, such as the genetic code, the immune code, the metabolic code, and the neural code) is syntax, through which the same construction pieces may be assembled in an infinite number of ways. Consequently, the human primary modeling system can produce an indefinite number of models and worlds.

All species communicate in a world peculiar to that species alone ensuing from the type of modeling characteristic of that species. In the early stages of its development, the hominid was endowed with a modeling device able to produce an infinite number of worlds. This explains the evolution of hominids into *Homo sapiens sapiens*. The reason why it is possible for such animals to produce a limitless number of worlds is that the human modeling device, or language, functions in terms of syntax – that is, in terms of construction, deconstruction, and reconstruction with a finite number of elements that may be composed and recomposed in an infinitely great variety of different forms. We are referring to the human ability to reflect on sign materials, means, and models (i.e., on that which has already been modeled), to the end of using such materials in new modeling processes. This is what is intended by specific human semiosis – that is, 'semiotics.' Body languages are semiotical.

Body Language and the Sign–Body General Connection

The previous discussion demonstrated the connection with body language and human semiosis. However, body language belongs to the general connection between signs and bodies that is found in all the universe of life (i.e., in all planetary semiosis). This implies continuity from nonhuman animal signs to human signs. As Morris (1946/1971b: 13) concludes his discussion of the distinction between nonhuman animal signs and human signs, human language (and the postlanguage symbols it makes possible) goes far beyond the sign-behavior of animals. On this subject, the following observation is similar to Sebeok's conception of human signs:

> But language-behavior is still sign-behavior, and language signs rest upon, and *never completely take the place of* [italics added], the simpler signs which they presuppose. The continuity is as real as the discontinuity, and the similarity of human and animal sign-behavior as genuine as the difference.

All sign processes include the body in some sense because the entire sign process takes place in a biological, social, or technical medium; it must have a channel of access to the object interpreted. Channels and media are different and consequently have different ways to connect sign and body. The source may be (1) an inorganic body, such as a natural inorganic object or manufactured inorganic object, and in this case, the interpreted may be a sign only because it receives an interpretation from the interpreter ('semiosis of information'), or (2) an organic substance or a living being (organism or components) belonging to *H. sapiens* or speechless creatures ('semiosis of symptomatization,' in which the sign is unintentional, and 'semiosis of communication,' in which the sign is intentional). In body signs of symptomatization semiosis (symptoms, clues, and traces) the interpreted sign is already an interpretant response before being interpreted as a sign by an interpretant. However, this response is not oriented to being interpreted as a sign; that is, it does not come to life for the purpose of being interpreted. On the contrary, in semiosis of communication where too the interpreted is already an interpretant response before being interpreted as a sign by the interpretant, this interpretant response is intended to be interpreted as a sign.

When an organism or a machine takes an object as a sign of another object, it must have a 'channel,' a passageway to access it. Possible channels are gases, liquids, and solids with regard to matter; they are chemical and physical with regard to energy. Concerning the latter, channels may be acoustic (air, water, and solids) or optical (reflected daylight or bioluminescence; Sebeok, 1991: 27–28), tactile, chemical, electric, magnetic, or thermal. Semiosis may engage several channels and also a simultaneous use of more than one channel, as is frequently the case in human communication.

'Medium' can be used as a synonym of channel (Sebeok, 1991: 27), but medium is also the world in

which semiosis takes place. It may be a biological, social, or technical medium. In this double sense that connects medium to model and modeling, we may refer to semiosis in the world of technical instruments and social institutions. In any type of semiosis there is a connection between signs and bodies, signata and signantia, media/channels and significata, semiosis and materiality. Materiality of the signans (Petrilli, 1990: 365–401; Rossi-Landi, 1992: 271–299) is not limited to extrasign materiality, physical materiality (the body of the signans and its channel), and instrumental materiality (nonsign bodily residues of nonverbal signs, i.e., their nonsign uses and functions; Rossi-Landi, 1985: 65–82). More than this, materiality of the signans is 'semiosic materiality,' and in the sphere of anthroposemiosis it is also 'semiotic materiality.' Semiotic materiality is historicosocial materiality at more or less high levels of complexity, elaboration, and/or articulation (elaboration materiality). It is ideological materiality, extraintentional materiality (i.e., objectivity independent from consciousness and volition), as well as signifying otherness materiality (i.e., the possibility of engendering other signata than the signatum of any specific interpretive route) (Ponzio, 1990: 15–61, 1994: 42–45). Signs are bodies. However, the physical object may be transformed into a sign while still belonging to the world of physical matter due to 'sign work,' to use Rossi-Landi's terminology. As a sign, the physical body acquires meaning engendered in the relation to something else, it defers to something external to itself, and it reflects and refracts another reality from itself (Voloshinov, 1929/1973: 10):

> Signs also are particular, material things; and ... any item of nature, technology, or consumption can become a sign acquiring in the process a meaning that goes beyond its given particularity. A sign does not simply exist as a part of reality – it reflects and refracts another reality.

The following distinction is proposed: The expression 'semiosic corporeality' is used for bodies that have become signs in a world modeled by living beings where sign processes are languageless, and semiotic corporeality is used where bodies that are signs presuppose a world modeled by language (i.e., a human world).

As Marx (Marx and Engels, 1845/1968: 42), suggested, "From the start the 'spirit' is afflicted with the course of being 'burdened' with matter, which here makes its appearance in the form of agitated layers of air, sounds, in short, of language." Here, language is "agitated layers of air, sounds": This is about its physical materiality. However, language is also human consciousness and the organization of human life: This is about the semiotic materiality of language as human primary modeling. "Language is as old as consciousness, language is practical consciousness that exists also for other men, and for that reason alone it exists for me personally as well" (Marx and Engels, 1845/1968: 42). Language is "the immediate actuality of thought. ... Neither the thought, nor the language exist in an independent realm from life" (Marx and Engels, 1845/1968: 503–504).

As a body, the sign is material in a physical sense; as sign, it is material in a semiosic sense; and as human historicosocial matter, it is material in a semiotic sense. In human worlds modeled by language, a body is a sign because of its historicosocial materiality. It is this kind of materiality that interests us when a body is taken into consideration and studied as a human sign (i.e., in a semiotic framework).

The Body in the Sign

In contemporary general semiotics, of which the most holistic expression is Sebeok's 'global semiotics,' the criterion of life (i.e., of living body) is semiosis. Using the formula employed by Marcel Danesi to sum up Sebeok's conception of the semiosic character of living beings, we may say that the body is in the sign (i.e., life is defined by semiosis). In the human animal, or 'semiotic animal,' this means that semiosis is the bond that links together body, mind, and culture (Danesi, 1998: 16). Studies on the manifestation patterns of semiosis in nature and culture show persuasively that in anthroposemiosis there exists an inextricable nexus among sign, body, and culture.

The type of sign (according to Charles S. Peirce's typology of signs), in which the body lives and organizes its world on the basis of its species-specific modeling device, is first and foremost the 'icon.' In other words, iconicity is a basic signifying strategy in various life-forms. The iconic mode of representation is the relation of the sign with its referent through replication, simulation, imitation, or resemblance. Iconicity is the default form of semiosis, as Sebeok demonstrated by documenting that in vastly different species the manifestation of the capacity to produce signs stands in some direct simulative relation to their referents. In his works, Sebeok showed the variety of manifestations of iconicity in different species. Iconic signs can thus be vocal, visual, olfactory, gustatory, or tactile in their form. It may be that in humans too all signs start out as a simulative relation to their referential domains. Like Peirce, Sebeok viewed iconicity as the primordial representational strategy in the human species. Danesi (1998: 10) considers iconicity as an aspect of utmost relevance in the study of signs.

He emphasizes the important role of iconicity – documented by Sebeok especially in the final three chapters of his 1986 book – in the bond that links semiosis, body, mind, and culture. This inextricable nexus manifests itself in the form of iconical representational behavior. "Iconicity is, in effect, evidence of this nexus" (Danesi, 1998: 37).

Danesi (1998: 18–20) refers to the conception that the iconic mode of representation is the primary means of bodily semiosis as the 'iconicity hypothesis.' Consequently, another principle of global semiotics or semiotics of life is the 'sense-implication hypothesis' (Danesi, 1998: 17), which suggests that semiosis is grounded in the experiential realm of sense. This principle has a philosophical antecedent in John Locke – according to which all ideas came from sensation first and reflection later – but it is connected with modeling theory: what is acquired through the body is modeled differently through the innate modeling system possessed by different species. In fact, a species perceives according to its own particular anatomical structure and to its own particular kind of modeling system. Due to its species-specific modeling system, called language by Sebeok, *Homo*, the semiotic animal, not only is a sophisticated modeler of the world but also has a remarkable ability to re-create his world in an infinite number of forms.

The living body is initially an iconic sign – that is, in a world iconically modeled. This is valid too in the case of the human species on the ontogenetic and phylogenetic levels. Natural learning flow (i.e., the semiosic process in which children acquire knowledge) takes place through the body and human primary modeling system and proceeds from iconicity to the forms of modeling that children learn in the cultural context. To recognize that the body is, lives, in the sign with reference to human ontogenetic development in the body–sign–culture relation implies, as Danesi (1998: 61) states, that the semiosic capacities of the learner and the determination of his or her semiosic stage – rather than the subject matter to be learned – should therefore be the focus of education. The main implication of the formula 'the body in the sign' and modeling theory for education is of a methodological nature. If the teacher is familiar with the forms of the semiosic process in human learning, he or she would be in a better position to help the learner acquire knowledge and skill more effectively and efficiently. In fact, the key to successful learning, states Danesi, lies, arguably, in determining at what point the learning phase is ready to be overtaken by the following – that is, what the Russian psychologist Vygotsky (1934/1962) called the 'proximal zone' of learning. The semiotic approach to education, as the psychologist and semiotician Vygotsky claimed, is indispensable for an appropriate foresight of the 'zones of proximal development' of each particular learner.

The Body in the Languages of Globalization and 'Grotesque Realism'

Here, another argument is added to those proposed by Danesi in order to consider the implications of the formula 'the body in the sign' for education. Included as goals in education are the capacity for criticism, social conscience, and responsible behavior. On this subject, the previously mentioned formula has implications for an adequate consciousness and comprehensive interpretation of communication under present-day semiosis conditions (i.e., in the phase named 'globalization').

In the current age, characterized by the automated industrial revolution, the global market, consumerism, and the pervasiveness of communication through the whole production cycle (communication – production, communicative exchange, and consumption of goods that are messages), 'the body in the sign' highlights that globalization and therefore languages of globalized communication incorporate human life in all its manifestations. 'Life in all its manifestations' refers to life in the form of development (well-being and consumerism) as well as in the form of underdevelopment (poverty and impossibility of survival); in the form of health and of disease; in the form of normality and deviation; in the form integration and emargination; in the form employment and unemployment; in the form functional transfer of the workforce, characteristic of emigration and migration, which expresses the denied request of hospitality; and in the form of exposition to war disseminated at a worldwide level, and planned as infinite. Again, incorporation of the body in the languages of globalized communication is not limited to human life alone. Life over the whole planet is now involved (even compromised and put at risk).

The planetary perspective of global semiotics allows for the necessary distance and indeclinable responsibility (a responsibility without alibis) for an approach to contemporaneousness that does not remain imprisoned within the confines of contemporaneity itself.

The controlled insertion of bodies into languages of the production apparatus of global communication goes hand in hand with the spread of the concept of the individual as a separate and self-sufficient entity. The body is understood and experienced as an isolated biological entity, as belonging to the individual, as an autonomous sphere of private interests. Such an attitude has led to the almost total extinction of cultural practices and worldviews based on

intercorporeality (i.e., reciprocal interdependency), exposition and opening of the living body. Think of the ways the body is perceived in popular culture, discussed by Bakhtin (1965) in the forms of carnival and grotesque realism, where the body and corporeal life generally are conceived neither individualistically nor separately from the rest of terrestrial life and, indeed, from the world.

We refer to verbal and nonverbal languages of the grotesque body that we may find in all cultures on the planet and in the literary carnivalized genres of all national literatures. Grotesque realism presents the body as something that is not defined once and for all, that is not confined to itself, but as flourishing in symbiosis with other bodies, in relations of transformation and renewal that far exceed the limits of individual life.

Globalization, in which communication is exploited for profit, does not weaken the individualistic, private, and static conception of the body, connected with the rise of the bourgeoisie, but, on the contrary reinforces it. Division and separatism among the sciences are functional to the ideological–social necessities of the 'recent new cannon of the individualized body' (Bakhtin, 1965). This in turn is functional to the controlled insertion of bodies into the languages of the reproduction cycle of today's production system. The interdisciplinary focus of global semiotics and attention on the signs of the interconnection between living bodies, human and nonhuman, are the presuppositions of an education that is free from stereotyped, limited, and distorted ideas and practices of communication under present-day conditions. This is another implication of the semiotic global approach for education and another possible meaning of the proposition chosen by Danesi to sum up what Sebeok said: 'The body is in the sign' – that is, semiosis is the bond that links the body, the mind, and culture.

Body Language and Speech in Human Phylogenesis

It appears virtually certain that early hominid forms that evolved to *Homo erectus* had language as an interior modeling device, although not speech. As previously mentioned, a modeling system is a tool with which an organism analyzes its surroundings. Language as a modeling system seems to have always been an exclusive property of the species *Homo*. It is an original *lingua mutola* (a mute, speechless language) described by Giambattista Vico in *La scienza nuova*, and which consists in the inventive, 'poetic' capacity to model different possible worlds at the basis of communication among members of the early hominid species.

According to Sebeok's (2001a: 17–30) reconstruction, hominids to *H. erectus* (included) communicated with each other by nonverbal means, in the manner of all other primates. However, differently from the latter, its body signs were already body languages because they were founded on a specific human primary modeling device. *Homo habilis* ('handy man,' 2.4–2.0 million years ago) and *H. erectus* ('upright man,' more than 1.5 million years ago) with a brain volume of 800–1200 cm^3 and a far more elaborate tool kit (including fire), had language, but not speech, and communicated with mute body languages (i.e., in an articulate and organized world on the basis of syntax inherent to human primary modeling). Speech did not appear until our own immediate archaic *sapiens* ('wise man') ancestors appeared (approximately 300 000 years ago), who, as indicated by evidence from rule-governed behavior, not only had language but also manifested it in the form of speech.

Thus, although language as a specific human primary modeling system emerged on the scene perhaps 2.5 or 3.0 million years ago, verbal language or speech appeared solely in *H. sapiens* as a communication system and developed slowly in *H. sapiens sapiens* also as a cognitive system, namely as a secondary modeling system. However, the human nonverbal system had body languages as communicative devices implicating, similarly to future speech, language not reducible to a communicative device: The specific function of language in the evolution of anthroposemiosis was not to transmit messages and give information but to model species-specific human worlds. Following Sebeok, we may say that language is essentially 'mind work,' whereas speech is 'ear and mouth work.'

The relatively simple, nonverbal models that nonhuman animals live by, that hominids used to communicate, and that normal human infants (*in-fans*) likewise employ are indeed kinds of primary modeling. Consequently, the sign systems of nonhuman animals are merely body sign systems, whereas sign systems of the human animal (semiotic animal) including hominids and today's normal infants are body languages. However, as a type of primary modeling, all these models are more or less pliable representations that must fit 'reality' sufficiently to tend to secure survival in one's Umwelt.

Such 'top-down' modeling (to use a current jargon borrowed from the cognitive sciences) can persist and become very sophisticated indeed in the adult life of exceptionally gifted individuals, as borne out by Einstein's testimonial or by what we know about Mozart's and Picasso's abilities to model intricate auditory or visual compositions in their heads in

anticipation of transcribing this onto paper or canvas. This kind of nonverbal modeling is indeed primary, in both a phylogenetic and an ontogenetic sense. Syntax makes it possible for hominids not only to represent immediate 'reality' (in the sense discussed previously) but also, uniquely among animals, to frame an indefinite number of possible worlds in the sense of Leibniz (Sebeok, 1991: 57–58).

Dialogism of Body Language

In Bakhtin's view, dialogue consists of the fact that one's own word alludes always and in spite of itself, whether it knows it or not, to the word of the other. Dialogue is not an initiative taken by self. As clearly emerges from Bakhtin's analysis of novels by Dostoevsky, the human person does not enter into dialogue with the other out of respect for the other but, rather, in spite of oneself. Both word and self are dialogic in the sense that they are passively involved with the word and self of the other. Internal and external verbal discourse is implied dialogically in otherness, just as the 'grotesque body' (Bakhtin, 1965) is implied in the body of the other. In fact, dialogue and body are closely interconnected. Bakhtin's dialogism cannot be understood separately from his biosemiotic conception of sign. On this basis, he criticized both subjective individualism and objective abstraction. According to Bakhtin, there cannot be dialogism among disembodied minds. Unlike platonic dialogue, and similarly to Dostoevsky, for Bakhtin, dialogue is not only cognitive and functional to abstract truth, but it is also a life need grounded in the inevitable interconnection of the self's body with the body of other.

For Bakhtin, dialogue is the embodied, intercorporeal expression of the involvement of one's body with the body of the other. The concept of the body as an individual, separate, and autonomous body is only an illusion. The image that most adequately expresses the condition of intercorporeity is the grotesque body (Bakhtin, 1965) in popular culture, in vulgar language of the public place, and in the masks of carnival. This is the body in its vital and indissoluble relation to the world and to the body of others.

In 1926, Bakhtin published an article on the biological and philosophical subject titled 'Contemporary vitalism' (signed by the biologist I. I. Kanaev, who subsequently declared that Bakhtin was the author). In his description of the interaction between living body and environment and opposing the dualism of life force and physical–chemical processes, Bakhtin maintained that the organism forms a monistic unit with the surrounding world. In his works of the 1920s, Bakhtin criticized both the vitalists and the reflexologists, as well as both Freudianism and mechanistic materialism (e.g., the mechanistic view of the relation between base and superstructure). In Bakhtin's view, each of these different trends is vitiated by false scientific claims that underestimate the dialogic relation between body and world. Such approaches either dematerialize the living body or physicalize it in terms of mechanistic relations.

Bakhtin formulated the category of 'carnivalesque' in his study on Rabelais, which he extended to culture at a world level insofar as it is human and not just Western culture. The carnivalesque participates in 'great experience,' understood as offering a global view of the complex and intricate life of bodies, signs, and languages. As Bakhtin shows in the 1963 edition of his book on Dostoevsky, dialogue in the polyphonic novel has its roots in the carnivalesque language of the grotesque body. Plurivocality, ductility, and ambiguity of sense in verbal language (the expression of centrifugal forces in linguistic life) are also connected with the grotesque body. This is especially evident in the double character of verbal and gestural 'language of the public place,' of vulgar expression that is simultaneously laudatory and offensive. Most interesting on this subject is Bakhtin's reference (in Voloshinov, 1929/1973) to Dostoevsky's notes on an animated conversation formed of a single vulgar bodily word used with different meanings.

Foremost Expressions of Body Language

On the basis of the discussion of an issue that is essentially methodological and that also concerns body language (which coincides with the human semiosphere; i.e., the special semioses characteristic of the semiotic animal, the sole animal gifted with the primary modeling device called language by Sebeok), we may now consider some exemplars of body language.

As the expression of body language, we have already discussed such human signs as gesture, face expression, vocal songs, and bodily movements used to communicate in phases antecedent to verbal language (i.e., speech) on both the phylogenetic and the ontogenetic level. These are nonverbal signs used by infants and hominids before the advent of *H. sapiens*.

Body language includes signs studied by physiognomics – the discipline that studies the relations between bodily characteristics, especially facial features, and psychic characters of the human individual. In semiotics, an important work on the bond between body and temperament is *The open self* by Charles Morris (1948), who used the typology ('endomorphy,' 'mesomorphy,' and 'ectomorphy') proposed by psychologist William H. Sheldon in

The varieties of human physique and *Varieties of temperament* from a semiotic perspective.

Body language involves modifications of the cultural body, which belong to some complex sign system or merely to the binary presence/absence system, in a wide range of cultural alterations operated on the body from brands, tattoos, the stripping of the flesh, and piercing to maquillage, including the use of belladonna to dilate the pupils. Body language also includes dance, especially ritual dances, in which any small body movement can have a precise meaning.

We have also mentioned cultural modifications in the distinctive pheromonal function of the human chemical signature now studied by semiochemistry (Sebeok, 2001b: 96). On this subject, Sebeok cited both the novel *Das perfume* by Patrick Süskind, based entirely on the indexical facets of human semiochemistry, and a passage from Peirce concerning the study of odors as signs, with special reference to women's favorite perfumes. Human odors are classified by Sebeok as indexical signs, but this body language also has an iconic aspect (i.e., it also signifies on the basis of similarity): In the passage cited by Sebeok, Peirce's comment is the following: "Surely there must be some subtle resemblance between the odor and the impression I get of this or that woman's nature" (Sebeok, 2001b: 313).

Signs of body language are also signs that relate to phrenology, anthropometry, palmistry, and graphology or practices such as handwriting authentication and identification by fingerprinting or by individual unique sequences of DNA molecules. Moreover, body language is studied by the branch of semiotics called proxemics – that is, the semiotics of interpersonal space, originally developed by Edward T. Hall in the context of cultural anthropology.

Finally, body language includes such human sign systems as the 'sign language' of the American Indians (Sebeok, 1979), monastic signs (Sebeok and Umiker-Sebeok, 1987), and the language of deaf-mutes. The latter is further proof of the fact that man as a semiotic animal is not the speaking animal but the animal that is endowed with language, the primary modeling device. It is not true that dogs only lack speech. Dogs and other nonhuman animals lack language. Instead, the deaf-mute only lacks speech, as a pathology. This means that other nonverbal systems, such as the gestural, can be grafted onto the human primary modeling device. Also, due to these sign systems the deaf-mute is able to accomplish the same inventive and creative mental functions as any other human animal.

It must be emphasized that the connection between verbal language and body language largely depends on their common participation in language understood as human primary modeling.

Concerning verbal intonation, and specifically the important phenomenon of language creativity called 'intonational metaphor,' Bakhtin (1926/1983) observed that an intimate kinship binds the intonational metaphor in real-life speech with the 'metaphor of gesticulation.' In fact, the word itself was originally a 'linguistic gesture,' a 'component of a complex body gesture,' understanding gesture broadly to include facial expression, gesticulation of the face. Intonation and gesture belong to body language, and they express a living, dynamic relationship with the outside world and social environment.

By using intonation and gesticulation, stated Bakhtin (1926/1983), an individual takes up an active social position with regard to certain values. Of course, this position is conditioned by social instances. Verbal intonation and gesture participate in the creative modeling of human language. In this sense, they belong to the anthroposemiotic bond relating sign–mind–culture. In this bond also reside the aesthetic–creative forces of body language that create and organize artistic forms.

August Boeckh (**Figure 1**) was born in Karlsruhe on November 24, 1785, as the son of court secretary and notary Georg Matthäus Boeckh (1735–1790). Following the advice of his mother, he attended the well-known 'Gymnasium illustre' in Karlsruhe, where he received a special education under the supervision of mathematician and physicist Johannes Lorenz Böckmann (1741–1802), graduating as *Candidatus theologicus*. The influence of Schleiermacher and Friedrich August Wolf (1759–1824) led Boeckh to break off his theological studies in 1805 and devote himself to the study of Greek antiquity. Completing his studies in 1806, Boeckh went to Berlin to attend the 'Seminar für gelehrte Schulen,' directed by J. J. Bellermann, then headmaster of the Gymnasium 'Zum Grauen Kloster.' As a member of the seminar, Boeckh taught Latin, French, and history. He soon developed a friendship with Professors Buttmann and Heindorf, with whom he founded the *Berliner Griechische Gesellschaft*, also known as *Graeca*. After finishing his dissertation at Halle University, he moved to Heidelberg. He immediately passed his *Habilitation,* thereby obtaining an *Extraordinariat*, which was raised to an *Ordinariat für Klassische Philologie* in 1809, in the seminar founded by Friedrich Creuzer (1771–1858). Through cordial relations with Clemens Brentano (1778–1842) and Achim von Arnim (1781–1831), Boeckh introduced in detail Schleiermacher's Plato translations in the *Heidelbergische Jahrbücher*. Two years later, W. von Humboldt offered him a professorship in Berlin, where he earned high praise in the organization of teaching and research at the newly founded university. In 1812, the philological seminar, developed

Following the advice of his mother, he attended the well-known 'Gymnasium illustre' in Karlsruhe, where he received a special education under the supervision of mathematician and physicist Johannes Lorenz Böckmann (1741–1802), graduating as *Candidatus theologicus*. The influence of Schleiermacher and Friedrich August Wolf (1759–1824) led Boeckh to break off his theological studies in 1805 and devote himself to the study of Greek antiquity. Completing his studies in 1806, Boeckh went to Berlin to attend the 'Seminar für gelehrte Schulen,' directed by J. J. Bellermann, then headmaster of the Gymnasium 'Zum Grauen Kloster.' As a member of the seminar, Boeckh taught Latin, French, and history. He soon developed a friendship with Professors Buttmann and Heindorf, with whom he founded the *Berliner Griechische Gesellschaft*, also known as *Graeca*. After finishing his dissertation at Halle University, he moved to Heidelberg. He immediately passed his *Habilitation,* thereby obtaining an *Extraordinariat*, which was raised to an *Ordinariat für Klassische Philologie* in 1809, in the seminar founded by Friedrich Creuzer (1771–1858). Through cordial relations with Clemens Brentano (1778–1842) and Achim von Arnim (1781–1831), Boeckh introduced in detail Schleiermacher's Plato translations in the *Heidelbergische Jahrbücher*. Two years later, W. von Humboldt offered him a professorship in Berlin, where he earned high praise in the organization of teaching and research at the newly founded university. In 1812, the philological seminar, developed

Figure 1 August Boeckh 1857 (Berlin, Stadtmuseum Berlin. Fotografie: Christel Lehmann).

and directed by Boeckh, was raised to university level. Along with Schleiermacher, Savigny, and the anatomist Carl Asmund Rudolphi (1771–1832), Boeckh joined a commission charged with evaluating the university statutes that were introduced at the *Alma mater Berolinensis* in 1817.

A large part of Boeckh's scientific lifework emerged within the context of the Prussian Academy of Sciences, to which he was admitted in 1814. As successor of his friend Schleiermacher, Boeckh was secretary of the humanities section for 27 years (1834–1861). In 1815, he initiated on behalf of the Academy the four-volume *Corpus Inscriptionum Graecum* (CIG), published between 1825 and 1859. The ambitious enterprise of collecting all antique inscriptions led to Boeckh's reputation as the father of epigraphy and initiated the monumental academy projects successfully implemented by his successors Mommsen, Harnack, Wilamowitz, and Diels.

Boeckh was no armchair philologist. Besides lecturing and his academy work, he took on increasingly administrative tasks within the framework of building and extending the university. He was dean for the first time in 1814/1815, and was elected *Rektor* first in 1825. He held this office five times consecutively, last in 1860 at the age of nearly 75, when Berlin University celebrated its 50th birthday.

Boeckh's commitment reached far beyond the university. Not only did he remain interested throughout his life in political issues, he also participated actively on a regular basis. This is illustrated, e.g., by his commitment to the reform of the Prussian teacher education program and becomes even clearer by his dedication to German unification and academic freedom.

Boeckh's high offices at the university and the Academy, combined with his indisputable intellectual authority as a scholar, made him an important contact person for both court and state. He was careful, however, to preserve his independence, merely accepting the title of *Geheimer Regierungsrat*. In 1832, he ostentatiously declined working for the censorship agency, followed by his refusal to become *Kultusminister* in 1848.

Even without a political office, Boeckh exerted considerable influence over the intellectual life of his time, transcending the university and the academy. By accepting the philology chair, Boeckh had become *Professor eloquentiae et poeseos*. This position included not only formulating a foreword for the lecture timetable each semester and composing all Latin university documents, it also involved being the university's main speaker on festive occasions, a task he conscientiously fulfilled until shortly before his death. Boeckh's personal correspondence provides evidence that limitations on freedom of speech made this by no means easy for him. Yet Boeckh, who called himself a 'Protestant' in the actual sense of the word, never deviated from his personal opinion. His numerous speeches, which focused on the concept of academic freedom, profess a liberal point of view and a pugnacious humanism. Academic freedom found in him one of its most eloquent and persistent defenders.

Boeckh was married twice. In 1809 he married Dorothea Wagermann, the daughter of superintendent general Gottfried Wagermann. After her early death, Boeckh married Anna Taube in 1830. On August 3, 1867, August Boeckh died at the age of 82 as a result of lung disease.

Boeckh began with studies on Plato (especially 'Timaios') and the Pythagorean Philolaos, using his thorough mathematical education. Through Greek musical studies he discovered the field of Greek metrics. In Berlin, Boeckh developed a special interest in rhetorical-antiquarian matters, due to B. G. Niebuhr's influence. In 1817, he published *Die Staatshaushaltung der Athener*, the first Attic economic history. In the foreword, he articulates his wish that science should expand from a one-sided linguistic approach to an all-comprehensive exploration of Greek life. Boeckh did theoretically design and practically implement an extensive science of classical antiquity, comprising as equal components of a complex whole all areas of life and all of its cultural expressions. The over-enthusiastic plan of his youth to create a cultural-historical *oeuvre* entitled 'Hellen,' – intended to present an overall picture of Greek life in all of

its political, economic, religious, and intellectual facets – remained beyond his reach, mainly due to the existence of only insufficient preparatory work, or none at all, for too many sections of his envisioned composition. He never discarded his central idea of an interdisciplinary, cultural-study-based approach to classical antiquity. Instead, he advanced to heading the realistic philological school in opposition to the linguistic-text-critical school or so-called 'Wortphilologie,' of Gottfried Hermann (1772–1848). Hermann and his supporters argued that only through language could "everything else that characterizes a people be comprehended and understood." The dispute, begun with a review by Hermann of the first issue of CIG journal, continued for several years. Besides his interdisciplinary emphasis, it is especially Boeckh's insistence on a solid methodological basis for every research that casts him in such a modern light. His famous lecture on *Encyklopädie und Methodologie der Wissenschaften*, given regularly between 1809 and 1865, should be required reading for every philologist even today.

Boethius of Dacia (fl. 1275)

E Bell Canon, University of Georgia, Athens, GA, USA

© 2006 Elsevier Ltd. All rights reserved.

Boethius of Dacia, also known as Boethius the Dane and Boethius of Sweden, was born in the early 13th century. He was associated with the University of Paris as a teacher of philosophy and grammar, and his theory of language and grammar was based in the Averroist tradition of Aristotelian philosophy. Also called a 'radical Aristotelian,' Boethius found many of his philosophical writings condemned in 1270 and again in 1277 by the Bishop of Paris. It is possible that later in life, Boethius joined the Dominican Order and probably served in Dacia, Romania.

As a grammarian, Boethius was part of a group of like-minded thinkers called the 'Modistae.' The Modistae produced written works on the nature of language based on the then-recently rediscovered philosophies of the ancient Greeks, particularly Aristotle. They developed the notion of 'speculative grammar,' or the function of language as a mirror of what is real in the world. Boethius wrote on the nature and origin of grammar, including parts of speech in *Modi Significandi sive Quaestiones Super Priscianum Maiorem* (1980). In this work, he broke with the linguistic philosophy of Priscian by establishing grammar as a science:

> Quia ergo ea, de quibus est grammatica, sunt comprehensibilia ab intellectu et habent causas *per se*, ideo grammatica est scientia. ('Because, therefore, those things with which grammar is concerned are comprehensible by the intellect and have causes *per se*, it follows that grammar is a science.') (Quote and translation from McDermott, 1980.)

Boethius believed that philosophy and grammar were intertwined:

> One ought to be grammarian, in order that he might consider modes of signifying; a philosopher, so as to consider the properties of objects, and a philosopher-grammarian so as to derive the modes of signifying from the properties of objects. (Translation from McDermott, 1980.)

His belief that the human soul was not immortal, that the world was eternal, as well as his association

its political, economic, religious, and intellectual facets – remained beyond his reach, mainly due to the existence of only insufficient preparatory work, or none at all, for too many sections of his envisioned composition. He never discarded his central idea of an interdisciplinary, cultural-study-based approach to classical antiquity. Instead, he advanced to heading the realistic philological school in opposition to the linguistic-text-critical school or so-called 'Wortphilologie,' of Gottfried Hermann (1772–1848). Boethius of Dacia, also known as Boethius the Dane and Boethius of Sweden, was born in the early 13th century. He was associated with the University of Paris as a teacher of philosophy and grammar, and his theory of language and grammar was based in the Averroist tradition of Aristotelian philosophy. Also called a 'radical Aristotelian,' Boethius found many of his philosophical writings condemned in 1270 and again in 1277 by the Bishop of Paris. It is possible that later in life, Boethius joined the Dominican Order and probably served in Dacia, Romania.

As a grammarian, Boethius was part of a group of like-minded thinkers called the 'Modistae.' The Modistae produced written works on the nature of language based on the then-recently rediscovered philosophies of the ancient Greeks, particularly Aristotle. They developed the notion of 'speculative grammar,' or the function of language as a mirror of what is real in the world. Boethius wrote on the nature and origin of grammar, including parts of speech in *Modi Significandi sive Quaestiones Super Priscianum Maiorem* (1980). In this work, he broke with the linguistic philosophy of Priscian by establishing grammar as a science:

> Quia ergo ea, de quibus est grammatica, sunt comprehensibilia ab intellectu et habent causas *per se*, ideo grammatica est scientia. ('Because, therefore, those things with which grammar is concerned are comprehensible by the intellect and have causes *per se*, it follows that grammar is a science.') (Quote and translation from McDermott, 1980.)

Boethius believed that philosophy and grammar were intertwined:

> One ought to be grammarian, in order that he might consider modes of signifying; a philosopher, so as to consider the properties of objects, and a philosopher-grammarian so as to derive the modes of signifying from the properties of objects. (Translation from McDermott, 1980.)

His belief that the human soul was not immortal, that the world was eternal, as well as his association

with other Averroists such as Siger of Brabant, ultimately resulted in the condemnation of his writings by Etienne Tempier, bishop of Paris, in 1270 and again in 1277. Many of his writings are either lost or remain unedited. His three best-known works are *De summo bono* ('On the supreme good'), *De aeternitate mundi* ('On the eternity of the world'), and *De somniis* ('On dreams'). Although he professed his faith in Christ as a Christian and may have joined the Dominican Order, his philosophical theories kept him at odds with the church for the remainder of his life. The exact date and place of his death are unknown.

Böhtlingk, Otto Nikolaus (1815–1904)

S A Romashko, Moscow, Russia

© 2006 Elsevier Ltd. All rights reserved.

Born into a family of a German merchant in St Petersburg, Russia, Otto von Boehtlingk studied Oriental Languages at the university of his native city, but in 1835 he moved to Germany, where he felt that his interest in Sanskrit could be satisfied. After a short time in Berlin, he finished his studies in Bonn as a pupil of August Wilhelm von Schlegel and Chr. Lassen. In Bonn he published his first work, the Sanskrit grammar of Pānini with Indian scholia and his own commentary (Boehtlingk, 1839–1840).

In 1842 Boehtlingk returned to Russia to enter the Imperial Academy of Sciences in St Petersburg as a research fellow (he became a full member of the Academy in 1852). He published a series of articles on Sanskrit grammar, but the announced plan of an integral Sanskrit grammar never came into being. Instead, for a time he interrupted his work on Sanskrit and approached a new, pioneering task; the Academy commissioned him to systematize the Yakut data that had been collected by A. Th. von Middendorff's Siberian expedition. At that time, this unwritten peripheral Turkic language from Eastern Siberia was hardly known. Analyzing the received data and working with an informant he found in St Petersburg, Boehtlingk provided a descriptive work (Boehtlingk, 1851), which is still considered a classic in the field of Altaic studies. Boehtlingk adapted the ideas of early European typological theory (from W. von Humboldt, A. F. Pott, and H. Steinthal) for the practical analysis of an agglutinating language and used the methods of comparative and historical philology to distinguish the inherited Turkic vocabulary of Yakut from Mongolian and other borrowings.

The main work of Boehtlingk was the *Sanskrit dictionary* (Boehtlingk and Roth, 1855–1875), also known as the *St Petersburg dictionary*, which was compiled with assistance of Rudolf von Roth and other sanskritologists. It was the first European Sanskrit dictionary based not on Indian lexicographic works, but on the thorough study of primary texts. It was also a historical dictionary, representing the development of Sanskrit from the Vedic hymns through the late stages of the language. To complete his dictionary, Boehtlingk moved to Germany in 1868, with the permission of Russian authorities, where copious Sanskrit resources were available. He stayed in Germany until the end of his life, first in Jena and later in Leipzig. The so-called 'shorter version' of his Sanskrit dictionary (Boehtlingk, 1879–1889, also prepared with assistance of many sanskritologists) in fact includes an enlarged number of entries versus his earlier work; however, most of the examples were omitted from this version. An offspring of Boehtlingk's lexicographical work was a collection of Indian sayings (Boehtlingk, 1863–1865). During his life Boehtlingk published a number of Indian texts; his second edition of Pānini's grammar (Boehtlingk, 1887) contains not only the text and a German translation, but almost the half of the book consists of indices, word and root lists, grammatical commentaries, and other useful supplements.

Bolivia: Language Situation

M Crowhurst, University of Texas, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Bolivia is home to approximately 40 indigenous languages representing four distinct Amerindian stocks, an impressive degree of linguistic diversity (see **Figure 1**). Two European languages are also spoken: in addition to Spanish, Plautdietsch (Low German) is spoken in eastern Bolivia by Mennonites who emigrated from Canada (possibly via Mexico) to avoid conscription during World War I.

The best represented of the Amerindian stocks, in terms of number of living speakers, is Andean: Aymara and Quechua are spoken natively by millions of Bolivians. These languages are spoken primarily in the mountainous southwestern third of Bolivia. In recent years, the presence of Quechua and Aymara in urban centers further to the east has increased dramatically as speakers have migrated in search of better economic opportunities. A third Andean language, Leco, is nearly extinct, according to data from Bolivia's Rural Indigenous Census of 1994 (the source for all numerical figures in this article). Finally, Callahuaya (Callawalla), which blends Quechua morphosyntax with roots from Puquina, an extinct language of Peru, was a specialized (nonnative) language used by Incan herb doctors, and is still used by a few herb doctors today.

The great majority of Bolivia's languages spring from the Equatorial-Tucanoan and Macro-Panoan stocks (see **Figures 2** and **3**). A final group of three varieties – Besiro, as well as the now extinct Moncoca and Churapa – belong to the Chiquitano family, a linguistic isolate. (*Note:* the Ethnologue classifies Chiquitano as Macro-Ge. This is probably an oversimplification: Díez Astete and Murillo (1998: 75–76) indicated that Chiquitano is an artificial family constituted of more than 40 languages spoken by ethnolinguistic groups who were forcibly relocated in Jesuit missions

Figure 1 Macro-linguistic affiliation of Bolivian languages (References: Ruhlen, 1991; Ethnologue).

These languages are spoken primarily in the mountainous southwestern third of Bolivia. In recent years, the presence of Quechua and Aymara in urban centers further to the east has increased dramatically as speakers have migrated in search of better economic opportunities. A third Andean language, Leco, is nearly extinct, according to data from Bolivia's Rural Indigenous Census of 1994 (the source for all numerical figures in this article). Finally, Callahuaya (Callawalla), which blends Quechua morphosyntax with roots from Puquina, an extinct language of Peru, was a specialized (nonnative) language used by Incan herb doctors, and is still used by a few herb doctors today.

The great majority of Bolivia's languages spring from the Equatorial-Tucanoan and Macro-Panoan stocks (see Figures 2 and 3). A final group of three varieties – Besiro, as well as the now extinct Moncoca and Churapa – belong to the Chiquitano family, a linguistic isolate. (*Note:* the Ethnologue classifies Chiquitano as Macro-Ge. This is probably an oversimplification: Díez Astete and Murillo (1998: 75–76) indicated that Chiquitano is an artificial family constituted of more than 40 languages spoken by ethnolinguistic groups who were forcibly relocated in Jesuit missions

Figure 1 Macro-linguistic affiliation of Bolivian languages (References: Ruhlen, 1991; Ethnologue).

[a] Some nodes in the linguistic trees in Figures 2 and 3 have been suppressed for simplicity. Where relevant, this has been indicated with a dashed line. Nodes representing families appear in small capitals. Language names appear in lower case, emphasized in boldface. Dialects of languages appear in lower case with no emphasis.

Figure 2 Equatorial-Tucanoan languages spoken in Bolivia (More detailed information concerning classification can be found in Ruhlen, 1991; Jensen, 1999; and the Ethnologue).

in the Chiquitos region beginning in 1550. The relationships among these languages is not known. Besiro is thought to have resulted from contact among several languages in this group.)

Bolivia's Equatorial-Tucanoan, Macro-Panoan, and Chiquitano languages, along with Itonama (Paezan), are (or were) spoken in the Tierras Bajas, or Lowlands, in the zones known as Amazonía (in the north), Oriente, and the Chaco (south, adjacent to Paraguay and Argentina). All of the lowland languages are endangered to a greater or lesser extent. Many, including Canichana, Cayubaba, and Reyesano, will become extinct once the few remaining, elderly speakers have passed away. Some lowland languages, for example, Guaraní and the Moxo varieties, are relatively stable. Still other languages, at greater risk of extinction, represent two general situations. Some are robust within their heritage communities, but the futures of the groups themselves are uncertain because their members are too few to guarantee sustainability (for

[a]Churapa, Moncoca, Jorá, Paunaca, Saraveca, Toromona, and Pauserna are not included in Table 1 because no data is available for these languages (which are extinct or nearly extinct). Callahuaya is not included because it is not spoken as a first language.
[b]Figures accompanies by the abbreviation ''abs'' represent absolute numbers, not percentage.
(Source: the Rural Indigenous Census of 1994, reported in Díez Astete & Murillo 1998.)

example, Araona, Ayoreo, and Sirionó). In other cases, the ethnolinguistic group itself faces no risk of imminent collapse but is undergoing a process of language shift in which the heritage language is gradually replaced by a regionally dominant language in all spheres of life. Examples are Guarayu, and especially Besiro, which is being passed on at a rate of only one child learner per eight adult speakers. The displacing language in Bolivia has generally been Spanish, but this has not always been the case: Chané (Arawakan), a language of the Chaco, was displaced by northwardly migrating Guaraní who conquered and enslaved the Chané people before the arrival of the Spaniards in the 16th century (Pifarré, 1989; Díez Astete and Murillo, 1998). Contact between Guaraní and Chané produced the antecedent of what is now Izoceño, one of three main dialects of Bolivian Guaraní (see Figure 2). Detailed demographic information concerning the linguistic status of Bolivia's lowland languages is provided in Table 1.

Boole and Algebraic Semantics

E L Keenan, University of California, Los Angeles, CA, USA
A Szabolcsi, New York University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

In 1854 George Boole, a largely self-educated British mathematician, published a remarkable book, *The laws of thought*, in which he presented an algebraic formulation of "those operations of the mind by which reasoning is performed" (Bell, 1965: 1). Since then, boolean algebra has become a rich subbranch of mathematics (Koppelberg, 1989), with extensive applications in computer science and, to a lesser extent, linguistics (Keenan and Faltz, 1985). Here we illustrate the core boolean notions currently used in the study of natural language semantics. Most such applications postdate Boole's work by more than a century, though Boole (1952: 59) anticipated some of the linguistic observations, pointing out, for example, that *Animals are either rational or irrational* does not mean the same as *Either animals are rational or animals are irrational*; similarly, *Men are, if wise, then temperate* does not mean *If all men are wise then all men are temperate*. Generative grammarians rediscovered such truths in the latter third of the 20th century.

We begin with the basic notion of a *partially ordered set* (*poset*) and characterize richer structures with linguistic applications as posets satisfying additional conditions (Szabolcsi, 1997; Landman, 1991).

A poset consists of a domain D of objects on which is defined a binary relation R, called a *partial order* relation, which is *reflexive* (for all x in D, xRx), *transitive* (xRy and yRz implies xRz), and *antisymmetric* (xRy and yRx implies $x = y$). For example, the ordinary arithmetical $\leq$ relation is a partial order: $n \leq n$, any natural number n; if $n \leq m$ and $m \leq p$, then $n \leq p$; and if $n \leq m$ and $m \leq n$, then $n = m$. Similarly, the subset relation $\subseteq$ is reflexive: any set A is a subset of itself. And if $A \subseteq B$ and $B \subseteq C$, then $A \subseteq C$, so $\subseteq$ is transitive. And finally, if $A \subseteq B$ and $B \subseteq A$, then $A = B$, that is, A and B are the same set, since they have the same members. So partial order relations are quite familiar from elementary mathematics.

A case of interest to us is the arithmetical $\leq$ restricted to {0, 1}. Here $0 \leq 1$, $0 \leq 0$ and $1 \leq 1$, but 1 is not ≤ 0. Representing the truth value 'False' as 0 and 'True' as 1, we can say that a conditional sentence 'if P then Q' is True if and only if $TV(P) \leq TV(Q)$, where TV(P) is the truth value of P, etc. Thus we think of sentences of the True/False sort as denoting in a set {0, 1} on which is defined a partial order, $\leq$. The denotations of expressions in other categories defined in terms of {0, 1} inherit this order. For example, one-place predicates (P1s), such as *is even* or *lives* in *Brooklyn*, can be presented as properties of the elements of the set E of objects under discussion. Such a property p looks at each entity x in E and says 'True' or 'False' depending on whether x has p or not. So we represent properties p, q as functions from E into {0, 1}, and we define $p \leq q$ if and only if (iff) for all x in E, $p(x) \leq q(x)$, which just means if p is True of x, then so is q. The $\leq$ relation just defined on functions (from E into {0, 1}) is provably a partial order.

Other expressions similarly find their denotations in a set with a natural partial order (often denoted with a symbol like '$\leq$'). A crucial example for linguists concerns the denotations of count NPs (Noun Phrases), such as *some poets, most poets,* etc., as they occur in sentences (Ss) like *Some poets*

Boole and Algebraic Semantics

E L Keenan, University of California, Los Angeles, CA, USA
A Szabolcsi, New York University, New York, NY, USA

In 1854 George Boole, a largely self-educated British mathematician, published a remarkable book, *The laws of thought*, in which he presented an algebraic formulation of "those operations of the mind by which reasoning is performed" (Bell, 1965: 1). Since then, boolean algebra has become a rich subbranch of mathematics (Koppelberg, 1989), with extensive applications in computer science and, to a lesser extent, linguistics (Keenan and Faltz, 1985). Here we illustrate the core boolean notions currently used in the study of natural language semantics. Most such applications postdate Boole's work by more than a century, though Boole (1952: 59) anticipated some of the linguistic observations, pointing out, for example, that *Animals are either rational or irrational* does not mean the same as *Either animals are rational or animals are irrational*; similarly, *Men are, if wise, then temperate* does not mean *If all men are wise then all men are temperate*. Generative grammarians rediscovered such truths in the latter third of the 20th century.

We begin with the basic notion of a *partially ordered set* (*poset*) and characterize richer structures with linguistic applications as posets satisfying additional conditions (Szabolcsi, 1997; Landman, 1991).

A poset consists of a domain D of objects on which is defined a binary relation R, called a *partial order* relation, which is *reflexive* (for all x in D, xRx), *transitive* (xRy and yRz implies xRz), and *antisymmetric* (xRy and yRx implies $x = y$). For example, the ordinary arithmetical $\leq$ relation is a partial order: $n \leq n$, any natural number n; if $n \leq m$ and $m \leq p$, then $n \leq p$; and if $n \leq m$ and $m \leq n$, then $n = m$. Similarly, the subset relation $\subseteq$ is reflexive: any set A is a subset of itself. And if $A \subseteq B$ and $B \subseteq C$, then $A \subseteq C$, so $\subseteq$ is transitive. And finally, if $A \subseteq B$ and $B \subseteq A$, then $A = B$, that is, A and B are the same set, since they have the same members. So partial order relations are quite familiar from elementary mathematics.

A case of interest to us is the arithmetical $\leq$ restricted to {0, 1}. Here $0 \leq 1$, $0 \leq 0$ and $1 \leq 1$, but 1 is not ≤ 0. Representing the truth value 'False' as 0 and 'True' as 1, we can say that a conditional sentence 'if P then Q' is True if and only if $TV(P) \leq TV(Q)$, where TV(P) is the truth value of P, etc. Thus we think of sentences of the True/False sort as denoting in a set {0, 1} on which is defined a partial order, $\leq$. The denotations of expressions in other categories defined in terms of {0, 1} inherit this order. For example, one-place predicates (P1s), such as *is even* or *lives* in *Brooklyn*, can be presented as properties of the elements of the set E of objects under discussion. Such a property p looks at each entity x in E and says 'True' or 'False' depending on whether x has p or not. So we represent properties p, q as functions from E into {0, 1}, and we define $p \leq q$ if and only if (iff) for all x in E, $p(x) \leq q(x)$, which just means if p is True of x, then so is q. The $\leq$ relation just defined on functions (from E into {0, 1}) is provably a partial order.

Other expressions similarly find their denotations in a set with a natural partial order (often denoted with a symbol like '$\leq$'). A crucial example for linguists concerns the denotations of count NPs (Noun Phrases), such as *some poets, most poets,* etc., as they occur in sentences (Ss) like *Some poets*

daydream. We interpret this S as True iff there is an entity x that both the 'poet' property p and the 'daydreams' property d map to 1. Similarly, *No poets daydream* is True iff there is no such x. And *Most poets daydream* is True iff the set of x such that $p(x)$ and $d(x) = 1$ outnumbers the set such that $p(x) = 1$ and $d(x) = 0$. That is, the set of poets that daydream is larger than the set that don't. And for F,G possible NP denotations (called *generalized quantifiers*), we define $F \leq G$ iff for all properties p, $F(p) \leq G(p)$. This relation is again a partial order.

As NP denotations map one poset (properties) to another (truth values), it makes sense to ask whether a given function F *preserves* the order (if $p \leq q$, then $F(p) \leq F(q)$), *reverses* it (if $p \leq q$, then $F(q) \leq F(p)$), or does neither. *Some/all/most poets* preserve the order, since, for example, *is laughing loudly* $\leq$ *is laughing* and *Some poet is laughing loudly* $\leq$ *Some poet is laughing*, which just means, recall, that if the first sentence is True, then the second is. In contrast, *no poet* reverses the order, since, in the same conditions, *No poet is laughing* implies *No poet is laughing loudly*. The reader can verify that *fewer than five poets, neither poet, at most six poets*, and *neither John nor Bill* are all order reversing. And here is an unexpected linguistic correlation: reversing order correlates well with those subject NPs that license negative-polarity items, such as *ever*:

(1a) No student here has ever been to Pinsk.
(1b) *Some student here has ever been to Pinsk.

Observe that as a second linguistic application, modifying adjectives combine with property-denoting expressions (nouns) to form property-denoting expressions and can be represented semantically by functions f from properties to properties. For example, *tall* combines with *student* to form *tall student*, and semantically it maps the property of being a student to that of being a tall student. And overwhelmingly when f is an adjective function and p a property, $f(p) \leq p$. All tall students are students, etc.

In fact, the denotation sets for the expressions we have discussed possess a structure much richer than a mere partial order: they are (boolean) lattices. A *lattice* is a poset in which for all elements x, y of the domain, the set {x, y} has a *least upper bound* (lub) noted $(x \vee y)$ and read as 'x join y,' and a *greatest lower bound* (glb), noted $(x \wedge y)$ and read as 'x meet y.' An *upper bound* (ub) for a subset K of a poset is an element z that every element of K is $\leq$ to. An ub z for K is a lub for K iff $z \leq$ every ub for K. Dually a *lower bound* (lb) for K is an element $w \leq$ every element of K; such a w is a glb for K iff every lb for K is $\leq w$. For example, in the truth value lattice {0,1}, lubs are given by the standard truth table for disjunction: $1 \vee 1 = 1$, $1 \vee 0 = 1$, $0 \vee 1 = 1$, and $0 \vee 0 = 0$. That is, a disjunction of two false Ss is False, but True otherwise. Similarly, glbs are given by the truth table for conjunction: a conjunction of Ss is True iff each conjunct is, and False otherwise. So here the denotation of *or* is given by $\vee$, and that for *and* by $\wedge$. And this is quite generally the case. In our lattices of functions, for example, $f \vee g$, the lub of {f, g}, is that function mapping each argument x to $f(x) \vee g(x)$. Similarly, $f \wedge g$ maps each x to $f(x) \wedge g(x)$. So, for example, in the lattice of properties, the glb of {POET, DOCTOR} is that property which an entity x has iff POET $(x) = 1$ and DOCTOR $(x) = 1$, that is, x is both a poet and a doctor. So, in general, we see that the lattice structure provides denotations for the operations of conjunction and a disjunction, regardless of the category of expression we are combining. We might emphasize that the kinds of objects denoted by Ss, P1s, Adjectives, NPs, etc., are quite different, but in each category conjunctions and disjunctions are generally interpreted by glbs and lubs of the conjuncts and disjuncts. So Boole's original intuition that these operations represent properties of mind – how we look at things – rather than properties specific to any one of these categories, is supported.

And we are not done: boolean lattices present an additional operation, *complement*, which provides a denotation for negation. Note that negation does combine with expressions in a variety of categories: with Adjectives in *a bright but not very diligent student*, with P1s in *Most of the students drink but don't smoke*, etc. Formally, a lattice is said to be *bounded* if its domain has a glb (noted 0) and a lub (noted 1). Such a lattice is *complemented* if for every x there is a y such that $x \wedge y = 0$ and $x \vee y = 1$. If for each x there is exactly one such y, it is noted $\neg x$ and called the *complement* of x. In {0, 1}, for example, $\neg 0 = 1$ and $\neg 1 = 0$. In our function lattices, $\neg f$ is that function mapping each x to $\neg(f(x))$. In distributive lattices (ones satisfying $x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z)$ and $x \vee (y \wedge z) = (x \vee y) \wedge (x \vee z)$), each x has a unique complement. A lattice is called *boolean* if it is a complemented distributive lattice. And, again, a linguistic generalization: the negation of an expression d in general denotes the complement of the denotation of d.

Given uniqueness of complements, $\neg$ is a function from the lattice to itself, one that reverses the order: if $x \leq y$, then $\neg y \leq \neg x$. We expect, correctly then, that negation licenses negative-polarity items in the predicate, and it does: *He hasn't ever been to Pinsk* is natural, **He has ever been to Pinsk* is not. Reversing the order on denotations, then, is what ordinary negation has in common with NPs such as *no poet, neither John nor Bill*, etc., which as we saw earlier also license negative-polarity items.

The boolean lattices we have so far invoked have further common properties. They are, for example, *complete*, meaning that each subset, not just ones of the form {x, y}, has a glb and a lub. They are also atomic (Keenan and Faltz, 1985: 56). In addition, different categories have some distinctive properties – which, with one exception, space limitations prevent us from reviewing (see also Keenan, 1983). The exception is the lattice of count NP denotations, needed for expressions such as *most poets* and *five of John's students*. This lattice has the property of having a set of complete, independent (free) generators, called *individuals* (denotable by definite singular NPs, such as *John, Mary, this poet*). This means that any function from properties to truth values is in fact a boolean function (meet, join, complement) of individuals (Keenan and Faltz, 1985: 92). And this implies that the truth value of an S of the form [[Det N] + P1], for P1 noncollective, is booleanly computable if we know which individuals have the N and the P1 properties. The truth of Ss like *Most of the students laughed, No students laughed*, etc., is determined once that information is given. This semantic reduction to individuals is a major simplification, in that the number of individuals is the number of elements in E, whereas the number of possible NP denotations is that of the power set of the power set of E. So speaking of an E with just four elements, we find there are just four individuals but 65 536 NP denotations.

These freely generated algebras show up in another, unexpected syntactic way. Szabolcsi and Zwarts (1993) observed that negation determines a context that limits the class of questions (relative clauses, etc.) we can grammatically form. Thus, the questions in (2) are natural, but those in (3), in which the predicates are negated, are not:

(2) How tall is John? How much did the car cost?
(3) *How tall isn't John? *How much didn't the car cost?

It is tempting to say simply that we cannot question out of negative contexts, but that is not correct. Both questions in (4) are acceptable:

(4) How many of the books on the list did/didn't you read?

A more accurate statement is that negation blocks questioning from domains that lack individuals (free generators), such as amounts and degrees. So, as with the distribution of negative-polarity items, we find an unexpected grammatical sensitivity to boolean structure.

Much ongoing work in algebraic semantics focuses on NPs (and their predicates) that are not boolean compounds of individuals. The predicates in the Ss in (5) force us to interpret their subjects as *groups*.

(5a) John and Mary respect each other/are a nice couple.
(5b) Russell and Whitehead wrote *Principia mathematica* together.
(5c) The students gathered in the courtyard/surrounded the building.
(5d) Six teaching assistants graded 120 papers between them.

Respecting each other (*being a nice couple*, etc.) holds of a group of individuals if certain conditions among them obtain. But it does not make sense to say **John respects each other* (**He is a nice couple*, etc.), so we must interpret *and* somewhat differently from the glb operator discussed earlier. We note that the other boolean connectives – such as *either* ... *or* ... and *neither* ... *nor* ... – do not admit of a reinterpretation in the way that *and* does (Winter, 2001). **Either John or Mary respect each other* is nonsense: the disjunctive subject still forces a lub interpretation in which *respect each other* would hold of at least one of the disjuncts.

First attempts to provide denotations for the subject NPs in (5) involve enriching the understood domain E of entities with a partial order relation called *part-of*, to capture the sense in which the individual John is part of the denotation of *John and Mary* in (5a) or some individual student is part of the group of students in (5c), etc. The group itself is a new type of object, one that is the lub of its parts. And new types of predicates, such as those in (5), can select these new objects as arguments. Thus, the domain of a model is no longer a mere set E but is a *join semi-lattice*, a set equipped with a *part-of* partial order in which each nonempty subset has a lub (see Link, 1983, 1998; Landman, 1991).

Yet other new types of arguments are *mass* terms (6a) and *event nominals* (6b).

(6a) Water and alcohol don't mix.
(6b) 4000 ships passed through the lock last year. (Krifka, 1991)

Mass term denotations have a natural *part-of* relation: if I pour a cup of coffee from a full pot, the coffee that remains, as well as that in my cup, is part of the original coffee. So mass term denotations are in some way *ontologically uniform*, with the result that definitional properties of a whole also apply to their parts – the coffee I poured and the coffee that remains are both coffee. This contrasts with predicates in (5), where *respect each other*, *gather in the courtyard*, etc., do not make sense even when applied to the proper parts of their arguments. In general, mass

terms are much less well understood than count terms (see Pelletier and Schubert, 1989; Link, 1998).

Last, observe that (6b) is ambiguous. It has a count reading, on which there are 4000 ships each of which passed through the lock (at least once) last year. But it also has an event reading, of interest here, on which it means that there were 4000 events of ships passing through the lock. If, for example, each ship in our fleet of 2000 did so twice, then there were 4000 passings but only 2000 ships that passed.

Now, the event in (6b) has the individual passing events as parts, so such complex events exhibit something of the ontological uniformity of mass terms. But there are limits. The subevents of a single passing (throwing lines to the tugboats, etc.) are not themselves passings. So events present a *part-of* partial order with limited uniformity, and at least some events can be represented as the lubs of their parts. But in distinction to pure mass terms, events are ontologically complex, requiring time and place coordinates, Agent and Patient participants, etc., resulting in a considerable enrichment of our naïve ontology (see Parsons, 1990; Schein, 1993; and Landman, 2000).

Boole, George (1815–1864)

E Shay, University of Colorado, Boulder, CO, USA

© 2006 Elsevier Ltd. All rights reserved.

George Boole, a mathematician who might have been a shoemaker, was born in Lincoln, UK, on November 2, 1815, to a lady's maid and a shoemaker who could have been a mathematician. The younger Boole, who acquired an early love of mathematics from his brilliant father John, studied Latin with a tutor and by his late teens had taught himself Greek, French, and German. Finances did not allow him an elite education, but through local schools, tutoring, and self-study he grew well versed in mathematics, languages, and literature. In 1831 he began teaching school, opening his own boarding school in 1835 while pursuing independent study of applied mathematics. Four years later he published his first professional paper.

Despite his non-standard education, Boole in 1849 received a professorship in mathematics at the new Queen's College, Cork, partly on the strength of testimonials from his hometown. In 1851 he was elected Dean of Science, the position he held until his death. At Cork he published the works for which he is best

George Boole, a mathematician who might have been a shoemaker, was born in Lincoln, UK, on November 2, 1815, to a lady's maid and a shoemaker who could have been a mathematician. The younger Boole, who acquired an early love of mathematics from his brilliant father John, studied Latin with a tutor and by his late teens had taught himself Greek, French, and German. Finances did not allow him an elite education, but through local schools, tutoring, and self-study he grew well versed in mathematics, languages, and literature. In 1831 he began teaching school, opening his own boarding school in 1835 while pursuing independent study of applied mathematics. Four years later he published his first professional paper.

Despite his non-standard education, Boole in 1849 received a professorship in mathematics at the new Queen's College, Cork, partly on the strength of testimonials from his hometown. In 1851 he was elected Dean of Science, the position he held until his death. At Cork he published the works for which he is best

known, including *An investigation into the laws of thought* (1854). The fundamental assumption of this work is that human language and reasoning can be expressed in algebraic terms and that the truth of a proposition can be examined without reference to the meaning of its components. Boolean logic is based on Boolean algebra, which is founded on the notions of sets, variables, and operators. If variables in an equation are replaced by propositions, and if operators are replaced by connectives such as 'and,' 'or,' 'not,' or 'if ... then,' the truth of a proposition may be evaluated in the same way as the truth of an algebraic statement. The results of such an evaluation are binary: a proposition is held to be either true or not true.

Boolean logic emerges in several subdisciplines of linguistics. The notion that the truth of a proposition may be understood without reference to its meaning is crucial to formal semantics, to the 'predicate calculus' of Frege and others, and to Chomsky's attempts to analyze grammar in mathematical terms. The binary nature of Boolean logic is fundamental to neuroscience, artificial intelligence, software design, and most notably to all digital and electronic devices that rely on binary switching circuits.

In addition to his seminal work on logic, Boole published roughly 50 papers on mathematics. He earned the Medal of the Royal Society in 1844 and was named a Fellow of the Society in 1857. In 1855 he married Mary Everest, niece of the famous explorer. He died of pneumonia on December 18, 1864.

Bopp, Franz (1791–1867)

E F K Koerner, Zentrum für Allgemeine Sprachwissenschaft, Berlin, Germany

© 2006 Elsevier Ltd. All rights reserved.

Bopp (**Figure 1**) was born on September 14, 1791 in Mainz, and died on October 23, 1867 in Berlin. After one year studying classical as well as modern languages at the newly created University of Aschaffenburg, he went to Paris, inspired by Friedrich Schlegel's (*see* **Schlegel, Friedrich von (1772–1829)**) *Ueber die Sprache und Weisheit der Indier* (1808), with the encouragement of his mentor Karl Joseph Windischmann, and through contacts established with the Orientalist Antoine Léonard de Chézy. There he studied Sanskrit (largely on his own), Arabic, and Persian with Antoine Isaac Silvestre de Sacy (*see* **Silvestre de Sacy, Baron Antoine-Isaac (1758–1838)**). In 1814, he received a grant from the King of Bavaria that allowed him to continue his research. This culminated in the book whose publication date – 1816 – is generally regarded as marking the beginning of comparative Indo–European linguistics. Bopp spent two more years in Paris until a grant from the Munich Academy of Sciences allowed him to move to London to add to his knowledge of Sanskrit through contacts with the most distinguished scholars in the field, Henry Thomas Colebrooke and especially Charles Wilkins, both of whom had published grammars of the language. During his stay in Britain, Bopp produced a revised English version of the linguistic portion of his *Conjugationssystem* (1820) (the remainder was devoted to translations from Sanskrit literature). While in Paris, Bopp had introduced Friedrich Schlegel's elder brother, August Wilhelm (*see* **Schlegel, August Wilhelm von (1767–1845)**) to the study of the classical Indic language and literature; in London, he tutored Wilhelm von Humboldt (*see* **Humboldt, Wilhelm von (1767–1835)**), who at the time was Prussian ambassador. In order to round off his studies to prepare himself for an academic career, Bopp asked the Bavarian Academy for permission to enroll at the University of Göttingen. Instead, the authorities there granted him a doctorate *honoris causa* in recognition for work already done. Soon afterwards, in the summer of 1821, he arrived in Berlin and (through the intervention of Wilhelm von Humboldt and his brother Alexander) was appointed extraordinary professor of Oriental languages and general linguistics. In 1825 he was made a full professor and a member of the Prussian Academy, in whose Proceedings he published a large number of his comparative linguistic works. From 1824 onward he published his own

Figure 1 Franz Bopp.

grammars of Sanskrit, and his comparative grammar of the major Indo-European languages appeared between 1833 and 1852. Although he had a number of distinguished students, including August Friedrich Pott (*see* **Pott, August Friedrich (1802–1887)**), Adalbert Kuhn, William Dwight Whitney (*see* **Whitney, William Dwight (1827–1894)**), and Michel Bréal (*see* **Bréal, Michel Jules Alfred (1832–1915)**), Bopp's enormous impact on Sanskrit studies and on the field of comparative philology was largely produced – apart from his voluminous comparative grammar – by the vast number of his empirical studies of individual branches of the Indo-European language family. However, as Bréal (1991) pointed out, another reason for his success was that he did not slavishly follow the Indic grammatical tradition in his treatment of Sanskrit but introduced his own perspective to the analysis of this language in conjunction with Greek, Latin, Persian, and other Indo-European languages. Thus he developed a method of showing their basic structural identity, which provided the framework for several generations of comparative-historical linguists.

Borgstrøm, Carl Hjalmar (1909–1986)

E Hovdhaugen, University of Oslo, Oslo, Norway

© 2006 Elsevier Ltd. All rights reserved.

Borgstrøm was born in Kristiania (Oslo), Norway. When he began his studies of Celtic languages, his teacher, professor Carl Marstrander, encouraged him to choose Scottish Gaelic dialects as his speciality. Borgstrøm's later studies of dialects on the Hebrides (Borgstrøm, 1940, 1941) were pioneer works and laid the foundation of subsequent investigations of Gaelic dialects.

Borgstrøm also studied comparative Indo-European philology and from 1932 to 1935 was Lecturer in Comparative Philology at Trinity College in Dublin. In 1936–1937 he was Visiting Professor of Sanskrit in Ankara. During his stay in Turkey he learned Turkish and consequently offered courses in Turkish at the University of Oslo. During the war Borgstrøm went to Sweden and in 1945 he was a lecturer of linguistics in Lund.

In 1947 he was appointed Professor of Comparative Indo-European Philology at the University of Oslo. However, during his entire career he published only a few articles in this field that were mainly overlooked or negatively received. His main interest (besides Celtic studies) was general linguistics, and he produced some discerning structural studies on Norwegian phonology (e.g., Borgstrøm, 1938).

However, his most important publication was his introductory textbook on general linguistics, first published in 1958. It was a successful symbiosis of American and European structuralism interspersed with Borgstrom's own ideas on language analysis. For almost two decades it was the basic textbook in linguistics in Norway and also to some extent in the other Nordic countries. Borgstrom thus had an important influence on the emergence of structural linguistics in the Nordic countries.

Borgstrøm was a shy and formal person, but as a teacher and supervisor he was unique. He stimulated, encouraged, and supported his students in a challenging way. A whole generation of Norwegian linguists was influenced by his broad theoretical orientation, his penetrating and constructive way of analyzing linguistic data, and his scholarly and human generosity.

Bosnia and Herzegovina: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

After the break-up of the Republic of Yugoslavia, and the following war in 1992–1995, Bosnia and Herzegovina was administratively divided into two entities: the Federation of Bosnia and Herzegovina and the Republika Srpska. The population of Bosnia and Herzegovina is about 4 007 608 (estimated, July 2004). There are three official languages: Bosnian, spoken by 48% of the population (2000 census), Serbian (37.1%), and Croatian (14.3%). Other languages spoken are German, Italian, Macedo-Romanian, Vlax Romani, Turkish, and Albanian.

The term 'Bosnian' refers to the languages spoken by Bosnian Serbs, Bosnian Croats, and Bosnian Bosniacs (formerly referred to as Bosnian Muslims), although the Croats and the Serbs in Bosnia and Herzegovina call their language Croatian and Serbian, respectively. Bosnian is used to refer to the language of the Bosniac group. All three languages – Bosnian, Serbian, and Croatian – are dialects of the standard version of Central-South Slavic, formerly and still frequently called Serbo-Croatian. Bosnian and Croatian use a Latin alphabet. Serbian uses both Latin and Cyrillic alphabets.

After the break-up of the Republic of Yugoslavia, and the following war in 1992–1995, Bosnia and Herzegovina was administratively divided into two entities: the Federation of Bosnia and Herzegovina and the Republika Srpska. The population of Bosnia and Herzegovina is about 4 007 608 (estimated, July 2004). There are three official languages: Bosnian, spoken by 48% of the population (2000 census), Serbian (37.1%), and Croatian (14.3%). Other languages spoken are German, Italian, Macedo-Romanian, Vlax Romani, Turkish, and Albanian.

The term 'Bosnian' refers to the languages spoken by Bosnian Serbs, Bosnian Croats, and Bosnian Bosniacs (formerly referred to as Bosnian Muslims), although the Croats and the Serbs in Bosnia and Herzegovina call their language Croatian and Serbian, respectively. Bosnian is used to refer to the language of the Bosniac group. All three languages – Bosnian, Serbian, and Croatian – are dialects of the standard version of Central-South Slavic, formerly and still frequently called Serbo-Croatian. Bosnian and Croatian use a Latin alphabet. Serbian uses both Latin and Cyrillic alphabets.

Botswana: Language Situation

H M Batibo, University of Botswana, Gaborone, Botswana

© 2006 Elsevier Ltd. All rights reserved.

Botswana is a medium-sized country located in southern Africa. It is completely landlocked, surrounded by South Africa to its south, Zimbabwe to its east, Namibia to its west, and Zambia and Namibia to its north. It is largely composed of the Kalahari Basin of the southern Africa Plateau. Apart from the Limpopo and Chobe rivers, drainage is internal, and largely to the Okavango Swamp in the northwest. The Okavango Delta, which has resulted from this inland drainage, as well as the surrounding area as far east as the Chobe Basin, is a rich habitat of both fauna and flora and has attracted many different communities, who live in the areas as farmers, fishermen, herders, or hunters.

The country has a population of over 1.7 million people (according to the 2001 census report), giving a density of about 3 people per square kilometer. However, the population is concentrated on the eastern and northern fringes of the country where the land is more fertile. On the other hand, the Kalahari desert of the central, west, and southwest area of the country is home to numerous groups of San and Khoe people, commonly known as Khoesan or Bushman, who traditionally live in scattered bands of no more than 30 people each. In fact, the San were the first inhabitants of the area, having lived there for at least 20 000 years as hunters and foragers. The Khoe arrived in the area about 4000 years ago, followed by the Bantu groups more than 2000 years later.

The territory, often attributed to Khoesan in language maps such as Greenberg's (see Greenberg, 1963), is misleadingly extensive, as settled areas are

Figure 1 The distribution of the 28 Botswana languages (after Batibo *et al.*, 2003).

better considered to be Bantu, who constitute more than 96% of the Botswana population. In fact the Khoesan groups, whose population is about 39 000 in Botswana, are fast vanishing due to integration into the more dominant and socioeconomically prestigious Bantu communities.

Linguistic Relationships

The country has 28 languages (see Figure 1), belonging to three main language families: Bantu (a subbranch of Niger–Congo), Khoesan (Khoisan), and Germanic (a subbranch of Indo-European). There are 14 Bantu languages, of which five belong to the Sotho branch of Southern Bantu: Setswana (Tswana), Shekgalagari, Sebirwa, Setswapong (Tswapong), and Silozi (Lozi). Three languages belong to the Sala–Shona branch of Southeastern Bantu: Ikalanga, Zezuru, and Nambya (Najwa). The southern branch of Central Bantu includes Chikuhane (Sesubiya), Shiyeyi (Yeyi) (erroneously classified by Guthrie [1948] in Zone R), Thimbukushu (Mbukushu), and Rugciriku (Rumanyo) [Diriku]. The only language that belongs to Western Bantu is Otjiherero (Herero) (classified by Guthrie in Zone R). Lastly, Sindebele (Ndebele), which is extensively spoken along the eastern borders of the country, belongs to the Nguni group of languages, together with IsiZulu (Zulu) and IsiXhosa (Xhosa) in South Africa.

There are 12 Khoesan languages which belong to three distinct groups: Northern Khoesan, with three languages: Jul'hoan, ǂKx'auǁ'ein, and ǂHua (formerly thought to belong to Southern Khoesan); Central Khoesan, with eight languages: Nama, Naro, |Gwi, ||Gana, Kua (Hietshware), Shua, Tshwa, and Khwedam (the last comprising Bugakhwe, ||Anikhwe, |Anda, and various Kxoe dialects). The last group, known as Southern Khoesan, has only one member in Botswana, !Xóõ. The other members of Southern Khoesan, formerly spoken mainly in what is now South Africa, have largely become extinct.

There are two Germanic languages: Afrikaans, spoken by about 7500 people, mainly Afrikaner settlers in farms and ranches in the Ghanzi and Kgalagadi districts (Grimes, 2000), and English, which is mainly spoken as a second language.

The figures presented in Table 1 are mere estimates, as no census involving language or ethnicity has taken place in Botswana since independence in 1966. It is difficult to come up with accurate figures regarding the speakers of the various languages, as many people tend to equate language with ethnicity or may want to identify themselves with the majority languages.

Setswana is found in three main dialects: the northern dialect, spoken in the northern areas by the Ngwato, Tawana, and part of the Kwena groups; the southern dialect, spoken in southern areas by the Ngwaketse, Rolong, Tlhaping, Tlharo and part of the Kwena groups; and the eastern dialect, spoken in the eastern areas by the Kgatla, Tlokwa and Lete groups. Setswana is the most dominant language both demographically and in terms of status and prestige. It is spoken by 78.6 percent of the population as first language, and is understood and used by over 90 percent of the population. It is the national language and the main lingua franca of the country. The only other widely used language is Ikalanga (Kalanga), which is spoken by over 150 000 people.

Leaving aside the very early literacy traditions of the Coptic, Nubian, Ethiopic, Vai, and Arab-speaking communities, the Setlhaping variety of Setswana in Botswana has the distinction of being the first African language known to develop an orthography and a literature, with the publication by Robert Moffat of the Christian New Testament in 1839.

Table 1 The estimated number of speakers of the Botswana languages

	Language	*Estimated number of speakers*	*Percentage of speakers*
1.	Setswana	1 335 000	78.6%
2.	Ikalanga	150 000	8.83%
3.	Shekgalagari (including Shengologa)	48 000	2.82%
4.	Thimbukushu	30 000	1.76%
5.	Shiyeyi	18 000	1.06%
6.	Nambya (Najwa)	15 000	0.88%
7.	Sebirwa	12 500	0.73%
8.	Zezuru (Shona)	12 000	0.70%
9.	Otjiherero	11 500	0.67%
10.	Naro	10 000	0.59%
11.	Sindebele	9000	0.53%
12.	Afrikaans	7500	0.44%
13.	Chikuhane (Sesubiya)	7000	0.41%
14.	Setswapong	6000	0.35%
15.	Shua	6000	0.035%
16.	!Xóõ	5000	0.29%
17.	Tshwa	5000	0.29%
18.	Khwedam	4500	0.27%
19.	Ju|'hoan	4500	0.27%
20.	Silozi (Serotsi)	3000	0.02%
21.	Sekgoa (English)	3000	0.002%
22.	Kua	2500	0.015%
23.	ǂKx'au||'ein	2500	0.015%
24.	Rugciriku (Rumanyo)	2300	0.14%
25.	||Gana	1300	0.008%
26.	Nama (Khoekhoegowab)	1000	0.006%
27.	|Gwi	1000	0.006%
28.	ǂHua	200	0.001%
	Total	**1 703 300**	**99.53%**

(After Batibo *et al.*, 2003).

Language Policy, Use, and Literacy

English is the official language of Botswana, while Setswana is the national language. Both are used in the administration and mass media. English is used in the formal business of government, while Setswana is generally used in semiofficial interactions, particularly in the oral mode. Setswana is used in lower primary education and English in upper primary and all the subsequent levels of education.

The official literacy rate is estimated at about 60 percent, although independent estimates of literacy in Setswana are lower. The enrollment for secondary level schooling is reported to be 21 percent. On the other hand, over 2000 students per year enroll in the University, giving Botswana the highest rate of university admission, proportionate to its population, in Africa.

Botswana is one of the countries in Africa where the smaller languages have very few speakers. Most of the small Botswana languages, especially those of Khoesan origin, are spoken by fewer than 10 000 people, most of whom are bilingual in the major languages, particularly Setswana. Hence, the process of language shift and death are a great concern to both linguists and the general public.

Bouvet Island: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Bouvet Island, so named after the French naval officer who discovered it in 1739, is a volcanic island situated in the southern section of the Atlantic Ocean, southwest of South Africa's Cape of Good Hope. It is the most isolated island on Earth – the nearest land, the Antarctic Continent, is more than 1600 km away. The first territorial claim came from the British in 1825, but in 1928 the claim was waived in favor of the Norwegian Crown. Bouvet Island was declared a natural reserve in 1971 and, since 1977, Norway has run an automated meteorological station on the island. With no native population, the island is considered a territory of Norway and is administered by the Polar Department of the Ministry of Justice and Police in Oslo. The official language is Norwegian and the few researchers who on occasion are present on Bouvet Island are subject to Norwegian law.

Bovelles, Charles de (1479–1567)

N Lioce, IVO Sint-Andries, Belgium
P Swiggers, Katholieke Universiteit Leuven, Leuven, Belgium

© 2006 Elsevier Ltd. All rights reserved.

Born in Saint-Quentin in Picardy (before March 28, 1479; according to some sources in 1475), Charles de Bovelles (Bouvelles/Bouelles; Latinized: Bovillus) studied in Paris (1495–1503) with J. Lefèvre d'Étaples and started writing his first philosophical works there. He then traveled through Switzerland, Germany, the Low Countries, and Spain. He received instruction in astronomy while in Rome in 1507. Upon his return to Picardy in 1508, he devoted himself to his ecclesiastic functions as a canon in Saint-Quentin and a priest in Noyon, combining these with a scholarly career. He died in Ham (Vermandois) on February 24, 1567 (some sources give 1553 or 1556 as date of his death).

His writings (and extensive scholarly correspondence) cover various domains such as theology, metaphysics, arithmetic, and geometry, but they primarily involved biblical studies, theology, ethics, and metaphysics. His philosophical work was inspired by Ramon Llull, Nicolas of Cusa, Marsilio Ficino, Giovanni Pico della Mirandola, and neo-Platonism in general, which was highly popular in 16th century humanist circles. In his classification of the sciences (in his *Metaphysicum introductorium*, 1503–1504), the liberal arts (grammar, dialectic, and rhetoric) are classified on the lower level; Bovelles, however, took a keen interest in language matters. As a typical Renaissance scholar he wrote almost all his works in Latin, except his poetry (published in 1529) and a manual of geometry (1511, the first geometry handbook in French). He also showed interest in popular sayings and proverbs; his collection of Latin sentences was translated into French in 1557 (*Proverbes et dicts sententieux avec l'interpretation d'iceux*).

Bovelles's main linguistic work is his study of dialect differences in northern France (1533), which also includes a valuable etymological dictionary (in which Bovelles also used Late Latin sources), and a less useful onomasticon. Like many humanists, he saw the relationship between Latin and the Romance languages as that between a regularized, fixed language and various vernacular offshoots, the latter characterized by irregularity and incapable of being laid down into rules (he denied the possibility of writing a grammar of French). He explains language evolution as due to astral determinism and human intervention (*arbitrium hominum*). In his analysis of dialect differences he shows himself as a keen observer of lexical and phonetic data; his work constitutes an important source for French diachronic lexicology. In his explanation of the diversification of Latin, Bovelles gave much weight to substratal and superstratal influences.

Boxhorn, Marcus Zuerius (1602/12–1653)

D Droixhe

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, p. 395, © 1994, Elsevier Ltd.

With C. Saumaise's *De hellenistica* (1643) and G. K. Kirchmayer's school in Wittenberg (see Metcalf, 1974), Boxhorn's work represents one of the most accomplished efforts in pre-comparativism, in its search for a European prototype called 'Scythian.'

Born in Bergen op Zoom (Netherlands) in 1602 or 1612, Marcus Boxhorn studied at Leiden, where he became professor of rhetoric and history, until his untimely death in 1653. As a young teacher, he submitted to his famous colleague Claude Saumaise linguistic comparisons, for example, between Greek *hudor* 'sweat', Latin *sudor*, and 'Celtic' *sud*. A strong Flemish tradition pushed him to look for the key of such a 'harmony' in his national language. The latter had been set among the oldest mother-tongues, on the basis of a relation between the Cimmerians of the Black Sea and the Dutch-Cimbrians (see Swiggers, 1984). Correspondences joining Persian and the Germanic languages had also been recently popularized by Justus Lipsius.

Boxhorn undertook a systematic exploration of the analogies that united the European languages, including the Celtic and Slavic ones. He drew profit from the discovery of Anglo-Saxon, but died before Franciscus Junius's edition of the Gospels in Anglo-Saxon and Gothic (1664–1665). His ideas were expounded in a Dutch *Antwoord* of 1647, concerning the sensational discovery of stone images of the goddess Nehalennia, whose name he interpreted as a 'Scythian root.' That 100-page essay was led to demonstrate the common origin of Greek, Latin, and Dutch.

In a rather traditional way he puts forward various lexical analogies, focusing on the 'basic vocabulary' (esp. names for body parts). His rudimentary search for phonetic rules must be compared to the universal equivalences previously established by Cruciger, Besold, Nirmutanus, Hayne, and others. But, contrary to most of these authors, he vigorously broke with the theory of Hebrew mother tongue, according to the secularization propagated in Leiden by Joseph Juste Scaliger (*see* **Scaliger, Joseph Justus (1540–1609)**) or Grotius. So, his *Originum gallicarum liber* (1654) thrashed John Davies (1632) for having linked Welsh with Hebrew. He was also said to have "planted the seed of Celtic philology in the fertile soil of the mind of Leibniz" (*see* **Leibniz, Gottfried Wilhelm (1646–1716)**).

Boxhorn, remarkably, extended the comparison into morphology: declension of Latin *unus* and German *ein*; likeness of the infinitive endings in Greek and Dutch; similitudes with Latin in the formation of present participles, comparatives, or diminutives. "It is obvious that those nations have learned their tongue from one mother, as can be seen from their ordinary manner of varying words and names, in the declensions, the conjugations, etc.; and even in the anomalies."

By laying the stress on his native language, sometimes awkwardly assimilated to 'Scythian' in declamatory statements, he already betrayed his own quest for a real prototype, and his *Originum gallicarum liber* finally fostered the Celtic fever. Despised by Saumaise – who arrived at the same historical conclusions (!) – Boxhorn was considered a monomaniac. One year before he died, he wrote to Huygens that he nevertheless maintained his ideas with 'pride' and 'joy,' being confident that he had "understood something true and important."

Brahui

P S Subrahmanyam, Annamalai University, Bangalore, India

© 2006 Elsevier Ltd. All rights reserved.

The word 'Brahui' designates both a language and its speakers. Brahui is the conventional spelling for the phonetically more correct Brāhōī/Brāhūī. The language is a member of the Dravidian family; more specifically, it belongs to the North Dravidian subgroup, of which the other two members are Kuṛux and Malto. The Brahuis live mainly in the Baluchistan and Sind provinces of Pakistan, but some are found also in Afghanistan (Šōrāwāk desert) and Iran (Sistan area). It is estimated that there are about 700 000 Brahui tribesmen, of whom only about 300 000 speak the language. Even those who speak Brahui are bilinguals in either Balochi or Siraki. There are two views current among the scholars to explain the location of Brahui, which is far away from the main Dravidian area. Whereas one view maintains that the Brahuis lived where they are now located from the earliest times, the other holds that they migrated to the current locations from that part of the main area that is occupied by the speakers of Kuṛux and Malto.

Phonology

The Brahui phonological system contains eight vowels and 28 consonants (see Tables 1 and 2). Proto-Dravidian short **e* and short **o* have been removed from the Brahui vowel system under the influence of Balochi; **e* developed into *i/a* and **o* developed into *u/a/ō* (the exact conditionings are not known). The *ē* and *ō* have shorter (and somewhat lower) allophones before a consonant cluster.

The voiceless stops *p*, *t*, and *k* may optionally be accompanied by aspiration in all positions (*pōk/phōk/phōkh* 'wasted'); however, aspirated stops in Indo-Aryan loans sometimes lose their aspiration in the south (*dhōbī/dōbī* 'washerman'). The voiceless lateral *L* is the most characteristic sound of Brahui since it does not occur either in Proto-Dravidian (PDr) or in the neighboring languages of Brahui. It comes from two sources, PDr (alveolar) **l* and (retroflex) **ḷ*; both of these also show the reflex *l* in some words, the conditioning being unclear because of the paucity of the data (*pāL* 'milk' < PDr **pāl*, *tēL* 'scorpion' < PDr **tēḷ*). The contrast between *L* and *l* is illustrated in *pāL* 'milk' and *pāl* 'omen.'

One major dialectal division in Brahui involves the voiceless glottal fricative *h*; it appears in all positions in the northern dialects but is replaced in the south by the glottal stop in initial and intervocalic positions, and is lost before a consonant or in final position; the following examples illustrate the variation in the northern and southern dialects, respectively: *hust*, *ʔust* 'heart'; *sahi affaṭ*, *saʔī affaṭ* 'I don't know'; *šahd*, *šad* 'honey'; and *pōh*, *pō* 'intelligence.'

Table 1 Vowels of Brahui

	Front		*Central*		*Back*	
	Short	*Long*	*Short*	*Long*	*Short*	*Long*
High	i	ī			u	ū
Mid		ē				ōō
Low			a	ā		

Syntax

Word Classes

The following word classes may be recognized for Brahui: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections. An adjective normally occurs before the noun it qualifies but may be shifted to the postnominal position for the sake of emphasis:

jwān-ō hullī-as
good-INDEF horse-INDEF
'good horse'

hullī-as jwān-ō
horse-INDEF good-INDEF
'good horse'

Nouns and adjectives characteristically distinguish between definite and indefinite forms. The basic forms are definite and the corresponding indefinite ones are derived by adding *-ō* to the adjective base and *-as* to the nominal base, as illustrated in the preceding examples. A definite adjective that is monosyllabic is often strengthened by the addition of *-ā/-angā*:

sun-angā šahr
deserted village
'deserted village'

An indefinite adjective can function also as a noun:

ball-ō
big-INDEF
'big (one)'

An adverb occurs before the verb. Adverbs may be divided into those of (1) time (e.g., *dāsā* 'now,' *darō* 'yesterday', *aynō* 'today', *pagga* 'tomorrow'), (2) place (e.g., *monaṭī* 'forward'), and (3) manner (e.g., *dawn* 'thus'). For particles, the enclitic pronouns

Table 2 Consonants of Brahui[a]

	Labial		*Dental*		*Alveolar*		*Retroflex*		*Palatal*		*Velar*		*Glottal (VL)*
	VL	*VD*	*VL*	*VD*	*VL*	*VD*	*VL*	*VD*	*VL*	*VD*	*VL*	*VD*	
Stop	p	b	t	d			ṭ	ḍ	c	j	k	g	ʔ
Nasal		m				n		ṇ					
Fricative	f										x	G	h
Sibilant					s	z			š	ž			
Lateral					L	l							
Trill						r							
Flap						ṛ							
Semivowel		w								y			

[a]Abbreviations: VD, voiced; VL, voiceless.

are very commonly used in Brahui. Whereas those for the third person are used in dialects throughout the Brahui area, those for the first and the second persons are more common in the Jahlawān dialect. They are suffixed to nouns or verbs. When added to a noun, they carry the sense of a pronoun in the genitive case; when added to a verb, they signal the direct or indirect object. The forms are: 1SG + *ka* 'my', 2SG + *nē* 'your,' 3SG + *ta* 'his/her/its', 3PL + *tā* 'their' (there are no plurals in the first and second persons):

maL-ē + ka
son-ACC/DAT + 1ENCL
'my son (accus.)/to my son'

xalkus + ka.
strike-PAST-2SG + 1ENCL
'You struck me.'

Word Order

The favored word order in Brahui is subject-object-verb:

ī	dā	kārēmē	kar-ōī	uṭ
I	this	work	do-NOM	be.1SG

'I must do this work.'

Sentences Without the Copular Verb

Like most of the other Dravidian languages (especially the southern ones), Brahui contains sentences without the copula in certain contexts:

numā	šahr-aṭī	aṭ	urā/ōʔ
your	village-LOC	how many	house

'How many houses are there in your village?'

Gender and Number

Brahui, like Toda of South Dravidian, has no gender distinction, but number (singular versus plural) is distinguished (see later, Plural Suffixes). The original neuter forms (both singular and plural) of the third person are retained to refer to all categories: *ō*(*d*) 'he/she/it' (cf. Ta(mil). *atu* 'it', Te(legu). *adi* 'she, it') and *ōfk* 'they' (cf. Ta. *av*(*ay*), Te. *avi* 'they (NEUT)').

Agreement

A finite verb shows agreement with the subject pronoun for person and number (see Table 3).

Noun Morphology

A nominal base is followed by the plural suffix when plurality has to be expressed and then by a case suffix; a postposition is normally attached to the genitive form of a noun.

Plural Suffix

The plural suffix is -k (variant -āk) in the nominative but -tē- before a nonnominative case suffix (see Table 4); as in the South Dravidian languages, use of the plural suffix is optional when plurality is understood from the context:

irā	mār/mā-k (<*mār-k)
two	son/son-PL

'two sons'

Case Suffixes and Postpositions

The nominative is unmarked; locative I means 'in' and locative II means 'on, by' (Table 4 shows all of the case forms of *xal* 'stone'). The following example shows postpositions:

ka-nā	nēmaGāī
my	towards

'towards me'

There are also a few prepositions, such as *bē*(*d*) 'without,' of Perso-Arabic origin that have entered Brahui through Balochi.

Pronouns

All of the pronouns are of Dravidian origin; however, Brahui developed postclitic forms of personal

Table 3 Finite tenses of *tix-* 'to put'

Tense	*Singular*	*Plural*
Past		
1.	*tix-ā* + *ṭ* 'I put'	*tix-ā* + *n*
2.	*tix-ā* + *s*	*tix-ā* + *re*
3.	*tix-ā*	*tix-ā* + *r*
Imperfect		
1.	*tix-ā* + *ṭ-a* 'I was putting'	*tix-ā* + *n-a*
2.	*tix-ā* + *s-a*	*tix-ā* + *re*
3.	*tix-āk-a*	*tix-ā* + *r-a*
Pluperfect		
1.	*tix-ā* + *sut* 'I had put'	*tix-ā* + *suṇ*
2.	*tix-ā* + *sus*	*tix-ā* + *sure*
3.	*tix-ā* + *sas*	*tix-ā* + *sur*
Perfect		
1.	*tix-ā-n* + *uṭ* 'I have put'	*tix-ā-n* + *un*
2.	*tix-ā-n* + *us*	*tix-ā-n* + *ure*
3.	*tix-ā-n* + *e*	*tix-ā-n* + *a*
Present indefinite		
1.	*tix-i-v* 'I may put'	*tix-i-n*
2.	*tix-i-s*	*tix-i-re*
3.	*tix-e*	*tix-i-r*
Future		
1.	*tix-o-ṭ* 'I will put'	*tix-o-n*
2.	*tix-o-s*	*tix-o-re*
3.	*tix-o-e*	*tix-o-r*
Nonpast negative		
1.	*tix-pa-r* 'I will not put'	*tix-pa-n*
2.	*tix-p-ēs*	*tix-p-ēre*
3.	*tix-p*	*tix-pa-s*

and demonstrative pronouns under the influence of Balochi (see preceding discussion, Word Classes). The first-person personal pronouns are *ī* 'I' and *nan* 'we'; the second-person personal pronouns are *nī* 'you(singular)' and *num* 'you (plural).' There is only the singular reflexive pronoun, *tēn* 'self'. The interrogative pronouns are *dēr* 'who?' and *ant* 'what?'. The third-person forms show a threefold deictic distinction: proximal *dā*(*d*) '(one) who is here' (plural *dāfk*), medial *ē*(*d*) '(one) who is at some distance' (plural *ēfk*), and distal *ō*(*d*) '(one) who is far off' (plural *ōfk*).

Numerals

Only the cardinal numbers for one, two, and three are of Dravidian origin (the forms without the final *ṭ* of these function as adjectives); all others are borrowed from Balochi. The number '1' is *asi*(*ṭ*), '2' is *ira*(*ṭ*), and '3' is *musi*(*ṭ*).

Verb Morphology

Verb Bases

A verb base in Brahui may be simple or complex. The complex base is formed from the simple one by the addition of the transitive-causative suffix *-if* (conditioned variant: *-f*). This suffix converts an intransitive into a transitive and an underived transitive into the corresponding causative; it is, therefore, possible to use the suffix twice in a sequence, e.g., *bin-* 'to hear,' *bin-if-* 'to cause to hear,' *kaʔ-* 'to die,' *kas-f-* 'to kill,' and *kas-f-if-* 'to cause (someone) to kill.'

Table 4 Case forms of *xal* 'stone'

Case	*Singular*	*Plural*
Nominative	*xal*	*xal-k*
Accusative-dative	*xal-ē*	*xal-tē*
Instrumental	*xal-aṭ*	*xal-t-aṭ*
Comitative	*xal-tō*	*xal-tē-tō*
Ablative	*xal-ān*	*xal-tē-ān*
Genitive	*xal-nā*	*xal-tā*
Locative I	*xal-*(*a*)*tī*	*xal-tē-tī*
Locative II	*xal-ā*(*ī*)	*xal-tē-ā*(*ī*)

Finite Verbs

There are four kinds of past tense (past, imperfect, pluperfect, and perfect), each with different shades of meaning, and all of them are periphrastic constructions involving the 'be' verb. The past stem, which is the basis for all of these, is formed by adding to the base *-b-* (conditioned variants: *-ē-*, *-k-*, *-g-*, *-is-*, *-s-*, *-ss-*). The following formulas give the structures of these tenses:

1. Past: past stem + present of *ann-* 'to be.'
2. Imperfect: past + *a*.
3. Pluperfect: past stem + past of *ann-* 'to be.'
4. Perfect: past stem + (*u*)*n* + present of *ann-* 'to be.'

The present indefinite, the future, and the nonpast negative are morphological constructions with the following structures (these and the previously mentioned tenses are illustrated in Table 3 with the verb base *tix-* 'to put'):

1. Present indefinite: verb base + *i* + personal suffix.
2. Future: verb base + *o* + personal suffix.
3. Nonpast negative: verb base + *pa* + personal suffix.

There are some other syntactic constructions involving *ann-* 'to be' that need not be mentioned here. One noteworthy feature of Brahui is the strategy of suffixing *-a* to form one type of finite verb from another. The imperfect present-future and the negative present-future are thus formed from the past present-indefinite and the nonpast negative, respectively.

The imperative suffixes are 2SG *-ø*, 2PL *-bo* (conditioned variant: *-ibo*):

tix
put-2SG
'Put!'

tix-bo
put-2PL
'Put (plural)!'

The corresponding negative imperative has the negative suffix *-pa-* (conditioned variant: *-fa-*) between the base and the imperative suffix:

tix-pa
put-NEG-2SG
'Don't put (singular)!'

tix-pa-bo̱
put-NEG-2PL
'Don't put (plural)!'

Nonfinite Verbs

The present adverb has the suffix *-isa*:

bis-isa
bake-PRES ADV
'baking'

The present adjective has the suffix *-ok*:

bin-ok
hear-PRES ADJ
'that hear(s)'

The infinitive-cum-action noun is formed by adding *-ing* (conditioned variant: *-ēng*) to the verb base:

bin-ing
hear-INF/VN
'to hear, hearing'

Braille, Louis (1809–1852)

A Bowers

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 396–397, © 1994, Elsevier Ltd.

Louis Braille's system is used worldwide to enable the blind to read and write by means of raised dots that are impressed from the reverse side of a page and read with the fingertips. The original system has been adapted to facilitate the notation of many other written forms, including non-European languages, shorthand, mathematical and scientific characters, and music.

Louis Braille was born in 1809 at Coupvray (Seine-et-Marne), the son of a saddler. At age 3, playing in his father's workshop, he injured one eye with a sharp instrument; complications resulted that led to total blindness. In time his father attempted to teach him to read the Roman letter shapes from wooden blocks studded with nails, but this could only serve as a beginning. At 10, in 1819, Braille was sent to an institution for blind children, in Paris (the Institution des Jeunes Aveugles), which had been founded five years earlier by Professor Valentin Haüy. Here, the teaching of reading seems to have been only slightly more advanced than that which the boy had

Figure 1 Standard English Braille. (Reproduced by kind permission of the Royal National Institute for the Blind, London, UK.)

experienced at home: again it relied on raised Roman letter shapes, though Professor Haüy is credited with embossing them on paper for his students.

At this time a former military officer, Charles Barbier, had researched a method for night-communication in battle by a code of dots embossed on cardboard, which he maintained would also benefit blind students. In 1824, however, at the age of 15, Braille adapted the existing ideas into a system whereby as many as 63 letters, abbreviations, and numbers could be embossed, requiring only a 6-dot code.

The code for each symbol or word was embossed from the back of the page using an awl and a perforated ruler, and arranged in a 'cell' or domino formation offering six possible dots, with extra guide symbols to multiply their possibilities. The columns were set about 3 mm apart, slightly more widely spaced than in present-day Braille. The inventor published this revolutionary system in 1829, by which time he was a teacher at the Institution. An accomplished musician, he also adapted his system to enable musical notation to be embossed.

Figure 1 is an example of the Standard English Braille dots representing letters and letter groups, together with some of the wide range of contractions, punctuation, and mathematical signs.

The Braille system revolutionized the speed of students' reading, and would have opened the way to large-scale embossed printing of books if the support of the authorities and funding had been available. In fact throughout his life Braille faced stubborn resistance from sighted teachers who insisted that the Roman letter shapes must be used, and several decades passed before his system was adopted widely in Europe. Its simplicity, compactness, and the speed with which it could be used would finally ensure its adoption. Braille died at 43, however, from tuberculosis, before his system was in common use even in his native France.

The only viable alternative that does not use encoded print is Moon Type, which was perfected in 1845 by William Moon, a printer from Brighton, UK. Moon Type uses Roman capital letters, and is valuable for users who have lost their sight late in life.

Introduction

The technique of promoting products by identifying them with the name of the manufacturer or with some invented name, known as the *brand name*, has become a primary marketing strategy since the turn of the 20th century. It was (and continues to be) based on the premise that the appeal of a product, called the 'brand,' increases if it can be linked to socially significant trends and values that the name evokes subconsciously. Turning a product into a brand thus transforms it into a sign – something that stands for something other than itself – that taps into social meaning systems that govern lifestyle, values, beliefs, and the like. For this reason, the semiotic study of brand creation as a central strategy of consumerist cultures has become widespread. Its origin can be traced to the general study of popular culture as a 'mythological sign system' by Roland Barthes (1915–1980) in 1957. It now constitutes a branch of semiotics, generally called *marketing semiotics* (e.g., Wolfe, 1989; Umiker-Sebeok, 1987; Berger, 2000; Beasley and Danesi, 2002; Danesi, 2002).

Brands and Advertising

The modern history of brands and 'persuasion' advertising overlap considerably (*see* **Marketing and Semiotics: From Transaction to Relation**). It is impossible to advertise 'nameless' products with any degree of persuasion. Brand names imbue products with identities in the same way that names given to human beings give them a distinct identity. It was in the 20th century that advertising evolved into a science of persuasion intended to influence people to perceive objects of consumption as 'necessary' accouterments of life, leading to a widespread, insatiable appetite for new objects of consumption in general 'groupthink.' Roland Barthes (1957) coined the term 'neomania' to characterize this type of groupthink (*see* **Mythologies in Pop Culture**).

Introduction

The technique of promoting products by identifying them with the name of the manufacturer or with some invented name, known as the *brand name*, has become a primary marketing strategy since the turn of the 20th century. It was (and continues to be) based on the premise that the appeal of a product, called the 'brand,' increases if it can be linked to socially significant trends and values that the name evokes subconsciously. Turning a product into a brand thus transforms it into a sign – something that stands for something other than itself – that taps into social meaning systems that govern lifestyle, values, beliefs, and the like. For this reason, the semiotic study of brand creation as a central strategy of consumerist cultures has become widespread. Its origin can be traced to the general study of popular culture as a 'mythological sign system' by Roland Barthes (1915–1980) in 1957. It now constitutes a branch of semiotics, generally called *marketing semiotics* (e.g., Wolfe, 1989; Umiker-Sebeok, 1987; Berger, 2000; Beasley and Danesi, 2002; Danesi, 2002).

Brands and Advertising

The modern history of brands and 'persuasion' advertising overlap considerably (*see* **Marketing and Semiotics: From Transaction to Relation**). It is impossible to advertise 'nameless' products with any degree of persuasion. Brand names imbue products with identities in the same way that names given to human beings give them a distinct identity. It was in the 20th century that advertising evolved into a science of persuasion intended to influence people to perceive objects of consumption as 'necessary' accouterments of life, leading to a widespread, insatiable appetite for new objects of consumption in general 'groupthink.' Roland Barthes (1957) coined the term 'neomania' to characterize this type of groupthink (*see* **Mythologies in Pop Culture**).

The dawn of advertising as a science of persuasion was signaled by the establishment and rapid growth of 'advertising agencies' at the end of the 19th century. These started composing newspaper ads, posters, and billboards for clients that related the qualities of a product not in themselves, but in relation to specific social and lifestyle trends. By the 1920s, such agencies had become themselves large business enterprises, continuously turning to psychologists to help them develop techniques and methods designed to influence the 'typical consumer' of the product. Business and psychology had clearly joined forces, broadening the attempts of their predecessors to build an unconscious bridge between a product and the consumer by playing on his or her emotional needs, fears, and expectations. With the entrenchment of electronic media (radio and television) in the 1940s and 1950s as mass communication outlets, advertising became itself a mass communication strategy, imprinting in groupthink the perception that objects of consumption were necessarily intertwined with the style and content of everyday life – a perception reinforced today through Internet advertising.

The influence of brand advertising on society is unmistakable. Its language has become the language of virtually everyone – even of those who are critical of it. This is because of its omnipresence in the social landscape. As Twitchell (2000: 1) aptly puts it, "Language about products and services has pretty much replaced language about all other subjects." The objective of brand advertising is, in fact, to get people to assimilate and react to advertising discourse unwittingly and in ways that parallel how individuals and groups have responded in the past to other kinds of 'authoritative' social discourse (such as religious discourse). Advertising language has become one of the most ubiquitous and persuasive forms of social discourse of the modern era. There are now even websites, such as AdCritic.com, that feature ads for their own sake, so that audiences can view them for their rhetorical and aesthetically pleasing qualities alone.

Creating Brand Identity

The main techniques that go into the creation of brand identity are called 'positioning,' 'image-creation,' and 'mythologization.' Positioning is the placing or targeting of a brand for the right market segment. For example, ads for the Mercedes Benz automobile are aimed typically at socially upscale car buyers, whereas ads for Dodge vans are designed to appeal (make sense) to middle-class individuals. The language of the ad, the lifestyle characteristics displayed in it, the overall 'look' of the personages in it, and so on are tailored to reflect class and appurtenant lifestyle distinctions. The register of the language used by the characters in Mercedes Benz ads, for instance, is sociolinguistically higher than that used by characters in Dodge van ads.

Creating an 'image' for a brand inheres in fashioning a recognizable 'personality' for it so that it can be positioned for specific market populations. Personality in this case refers to the traits and qualities that a potential consumer of the brand unconsciously possesses or aspires to have. The image is a sign constructed with an amalgam of signifiers (actual forms) – the brand name, design, logo, price, and overall presentation of the product. This amalgam creates is fashioned to appeal to specific consumer types – hence the term personality (as mentioned). Take alcohol brands as an example. What kinds of people drink beer? And what kinds drink aperitifs? In current American culture, answers to these questions would typically include remarks about the educational level, class, social attitudes, etc., of the consumer. The one who drinks beer is portrayed in ads as a down-to-earth character who simply wants to 'hang out' with friends; the one who drinks an aperitif is portrayed instead as a smooth, sophisticated type. The idea behind creating an image for the brand is, clearly, to speak directly to particular types of individuals, not to everyone, so that these individuals can see their own personalities mirrored in the lifestyle images created by the appurtenant advertising.

Brand identity is often also created by the technique of mythologization. This is the strategy of imbuing a brand with some mythic meaning, such as the quest for eternal beauty, the conquest of death, and so on. This is an especially widespread in the case of cosmetic and beauty products. The eternal beauty myth can be seen in the images that advertisers create for such products. The characters in the relevant ads are, typically, attractive people with a deified, mythic quality about them. They are not unlike the statues of ancient Greek gods like Apollo and Aphrodite. In effect, through positioning, image-creation, and mythologization, the modern advertiser stresses not the brand's qualities as a product or service, but rather the personality image that can be associated with it.

Brand Names

Creating an identity for a product is tantamount to creating a 'signification system' for it – a system of meanings that are relevant to specific kinds of individuals. This is achieved, first and foremost, by giving it a 'brand name.' The product, like a person, can then be easily differentiated from other products.

The legal term for brand name is 'trademark.' It is little wonder that trademarks are so fiercely protected by corporations and manufacturers. So powerful are they as identifiers that some have gained widespread currency, becoming general terms for the product type in common discourse. Examples include 'aspirin,' 'scotch tape,' 'cellophane,' and 'escalator.' Most brand names appear on the product, on its container, and in advertisements for the product. These provide, in effect, an easy way to determine who makes a certain product, helping consumers easily identify what they like about it so that they can purchase it again. A brand represents not only a certain social meaning, but also the manufacturer's reputation and good will.

A so-called 'strong brand' is a product name that has no recognizable meaning, such as Kodak. Strong brands receive broad protection from being used by other companies who might play on the name in order to cause confusion among consumers. 'Weak brands,' on the other hand, are product names created with common words, such as Premier, some of which refer to a characteristic of the product (e.g., Wet 'n Wash). These receive less protection, unless the public identifies them with a certain manufacturer as a result of extensive advertising and long, continuous use.

A brand was, originally, a recognizable mark made on the flesh of animals with a hot iron so as to identify ownership and qualities of the animals. The ancient Egyptians branded livestock as early as 2000 B.C.E. In the late medieval period, tradespeople and guild members posted characteristic visual 'marks' outside their shops for the same basic reasons – to identify the owner and quality of the product or service. Visual signs were used because most people were not literate at the time. Such signs became, a little later, the 'marks of the trade' or 'trademarks.' Shops selling medieval swords and ancient Chinese pottery, for instance, bore visual signs that buyers could identify and use, when put on the products themselves, to ascertain their origin and determine their quality. Among the best-known trademarks surviving from that era are the striped pole of the barbershop and the three-ball sign of the pawnbroker shop.

Names for common products, such as household ones, were first used towards the end of the 19th century. Previously, everyday household products were sold in neighborhood stores from large bulk containers. Around 1880, soap manufacturers started naming their products so that they could be identified and differentiated for their qualities. The first of these were Ivory, Pears', Sapolio, and Colgate. The concept of the brand name thus came into being, spreading rapidly because, as Naomi Klein (2000: 6) aptly observes, the market was starting to be flooded by uniform mass-produced and, thus, indistinguishable products: "Competitive branding became a necessity of the machine age." By the early 1950s, it became obvious that branding was not just a simple strategy for product differentiation but the very semiotic fuel that propelled corporate identity and product recognizability. Even the advent of no-name products, designed to cut down the cost of purchase, have had little counter-effects on the power that branding has had on the consciousness of people. Names such as Nike, Apple, Body Shop, Calvin Klein, Levi's, Coke, Pepsi, among many others, have become 'culture-wide signs' recognized by virtually anyone living in a modern consumerist society. As Klein (2000: 16) goes on to remark, for such brands, the name constitutes "the very fabric of their companies."

To continue to be effective, however, brands must keep in step with the times. In early 2000, some carmakers, for instance, started looking at naming trends that were designed to appeal to a new generation of customers accustomed to an Internet style of communication and representation. Cadillac, for instance, announced a new model with the monogram name CTS in 2001 and STS in 2005. Acura also transformed its line of models with names such as TL, RL, MDX, RSX. Such 'alphabetic names' evoke images of accuracy, technology, and sleekness in an analogy with similar abbreviating tendencies in science at large – e.g., 'laser' for 'l(ight) a(mplification) by s(timulated) e(mission of) r(adiation).' They are also consistent with 'Internet style,' a telegraphic form of language that spawns monogrammatic and alphanumeric signifiers on a daily basis. Hyundai's XG300 model, for instance, sounds perfect for Internet times. On the other side of the naming equation, such abbreviations are hard to remember, especially for older customers who have not yet tapped into Internetese.

As the above examples show, brand names are devised intentionally to create a signification system for products. At a practical informational level, naming a product has, of course, a denotative function; that is, it allows consumers to identify what product they desire to purchase (or not). But at a connotative level, the product's name generates images that go well beyond this simple identifier function (*see* **Denotation versus Connotation**). In the world of fashion, for instance, designer names such as Gucci, Armani, and Calvin Klein evoke connotations of the clothes as *objets d'art* rather than images of mere clothing items, shoes, or jewelry; so too do names such as Ferrari, Lamborghini, and Maserati in the domain of automobiles. The manufacturer's name, in such cases, extends the meaning of the product considerably.

When people buy an Armani or a Gucci product, they feel that they are buying a work of art to be displayed on the body; when they buy Poison, by Christian Dior, they sense instead that they are buying a dangerous, but alluring, love potion; when they buy Moondrops, Natural Wonder, Rainflower, Sunsilk, or Skin Dew cosmetics they feel that they are acquiring some of nature's beauty resources; when they buy Eterna 27, Clinique, Endocil, or Equalia beauty products they sense that they are getting products made with scientific precision; and so on.

Another common brand naming strategy involves iconicity – the strategy of creating names that resemble or assign some sensory property or social meaning to a product (*see* **Iconicity: Theory**). Iconicity is an effective strategy, because it renders the products highly memorable. A name such as Ritz Crackers, for example, assigns sonority to the product that is simulative of sounds that crackers make as they are being eaten. Another example of an iconic brand name is Drakkar Noir, chosen by Guy Laroche for a cologne product. Together with the dark bottle, the name conveys images of 'fear,' the 'forbidden,' and the 'unknown.' Forbidden things take place under the cloak of the night; hence the name *noir* (French for 'black'). The sepulchral name Drakkar Noir is clearly iconic with the bottle's design at a connotative level, reinforcing the idea that something desirous in the 'dark' will happen by splashing on the cologne. The word Drakkar is obviously suggestive of Dracula, the deadly vampire who came out at night to mesmerize his sexual prey with a mere glance.

The name of the Acura automobile, to give another example of the use of iconicity, was likely designed to be imitative of both Italian and Japanese words. Italian feminine nouns end in *-a* and certain Japanese words end in the suffix *-ura* (e.g., *tempura*). The brand name is thus linked iconically to Italian and Japanese words and, by extension, the perceived qualities of the respective cultures at once. Carmakers have used the same strategy of creating car names ending in the vowel *-a* which, given the inbuilt melodious quality of such a word, makes it not only easier to remember but also suggestive of specific qualities. Here are a few examples:

Achieva
Altima
Asuna
Aurora
Corsica
Elantra
Festiva
Integra
Lumina
Maxima
Precidia
Samara
Sentra
Serenia
Sonata

Brand names are clearly powerful signs, because they are suggestive of various qualities or attributes, either explicitly or implicitly. Here are examples of some of the strategies that are used to bring about overt or implicit suggestion.

1. Brand names that are the names of the actual manufacturers imply 'tradition,' 'reliability,' and, in the case of lifestyle products such as clothes, 'artistry,' 'sophistication,' and 'beauty':
   Armani
   Bell
   Benetton
   Calvin Klein
   Folger's
   Gillette
   Gucci
   Kraft
   etc.
2. Brand names referring to real or fictitious people elicit images built culturally into the bearers of the actual name (e.g., Wendy's evokes the image a friendly young girl), or else suggest qualities that the name itself is designed to emphasize (e.g., Mr. Clean):
   Aunt Jemima
   Barbie (the doll)
   Ken (the doll)
   McDonald's
   Mr. Clean
   Wendy's
   etc.
3. Names identifying the geographical location of a product or of a company suggest stability and tradition:
   American Bell
   Southern Bell
   Western Union
   etc.
4. Names designed to refer to some aspect of nature bestow upon the product the meanings that the particular aspect evokes:
   Aqua Velva
   Cascade
   Mountain Dew
   Surf
   Tide
   etc.

5. Names indicating the kinds of things that can be done with the product, such as a vehicle, or the kinds of places that can be visited with it, evoke connotations of lifestyle such as 'country living,' 'back-to-nature living,' 'wild-west lifestyle,' 'city life,' and so on:
   Dodge Durango
   Ford Escape
   Ford Expedition
   Ford Explorer
   Hyundai Santa Fe
   Jeep Grand Cherokee
   Jeep Renegade
   Jeep Wrangler
   Mercury Mountaineer
   etc.
6. Names constructed as hyperboles emphasize product 'superiority' and 'excellence':
   MaxiLight
   SuperFresh
   UltraLite
   etc.
7. Names created as combinations of words describe a product in a 'poetic' way:
   Frogurt (= Frozen + Yogurt)
   Fruitopia (= Fruit + Utopia)
   Yogourt (= Yogurt + Gourmet)
   etc.
8. Names designed to indicate what the product can do set off images of 'user-friendliness':
   Easy On
   Easy Wipe
   Kleenex
   Lestoil
   One Wipe
   Quick Flow
   etc.
9. Brand names designed to indicate what can be accomplished with the product are also suggestive of 'user-friendliness' and 'goal-achievement':
   Air Fresh
   Bug Off
   Close-Up Toothpaste
   No Sweat
   etc.

Even in relaying straightforward information, such as identifying the manufacturer (Bell, Kraft, etc.), indicating the geographical location of the company (Southern Bell, American Bell, etc.), describing what the product can do (Easy On, Quick Flow, etc.), and so on, brand names nevertheless create signification systems. The name Bell, for instance, evokes meanings of 'tradition' and 'reliance' that familiarity with the name kindles. In effect, every brand name entails an unconscious signification system – a set of connotations – of one kind or other. It is this system that is used and reused for various advertising purposes. Indeed, the more connotations a name evokes, the more powerful it is and, as a consequence, the more possibilities it offers to the advertiser for creating truly effective ads and commercials. The higher the 'connotative index' of a signification system, as it has been called (Beasley and Danesi, 2002), the greater its market appeal.

Table 1 Brand names and the signification systems they evoke

Brand names	*Signification systems*
Superpower, Multicorp, Future Now, Quantum Health Resources, PowerAde, etc.	'big picture,' 'forward-looking,' 'strong,' 'powerful,' etc.
People's Choice, Advantage Plus, Light N' Easy, Viewer's Choice, etc.	'free-spirited,' 'advantageous,' egalitarian,' 'common,' 'friendly,' etc.
Biogenical, Technics, Panasonic, Vagisil, Anusol, Proof Positive, Timex, etc.	'scientific,' 'methodical,' 'fool-proof,' 'accurate,' 'reliable,' etc.
Coronation, Morning Glory, Burger King, Monarch's Flour, etc.	'conquering,' 'regal,' 'majesty,' 'nobility,' 'blue-blooded,' etc.
Wash 'N Wear, Drip-Dry, Easy Clean, Okay Plus, etc.	'user-friendly,' 'simple,' 'uncomplicated,' 'basic,' etc.
General Electric, General Mills, General Dynamics, General Foods, etc.	'all-encompassing' 'widespread,' 'popular,' etc.
Cheer, Joy, etc.	'happy,' 'bright,' 'friendly,' 'smiling,' etc.
Pledge, Promise, etc.	'trustworthy,' 'reliant,' 'secure,' etc.

Table 1 shows just a few examples of how signification systems are generated by brand names.

Naming a product makes it possible to refer to it as if it had a distinctive character or quality – 'I don't trust Colgate products; they're useless'; 'I will only buy Quaker Oats; it suits me perfectly'; etc. It is meaningless to say something like 'I don't trust the toothpaste that has blue stripes in it'; or 'I will buy only the cereal that has an oat-like taste to it.' Moreover, a product with a name has the capacity, by its very nature, to tap into the brain's capacity to store meaningful categories in the form of language. A word classifies something, keeps it distinct from other things, and, above all else, allows it to have meaning over and above itself. The name Ivory, for example, evokes an image of something 'ultrawhite,' Royal Baking Powder of something 'regal' and 'splendid,' Bon Ami of 'a good friend,' and so on. Such suggestive images stick in the mind in the same way that the meanings of words do. They become an unconscious part of our semantic memory system.

It is little wonder that the term 'brand' is no longer used today just to refer just to a specific product line, but also to the company that manufactures it, to the image that the company wishes to impart of itself and of its products, and to the 'personality structure' that is perceived in users of the product. Thus, the name Coca-Cola now refers not only to the actual soft drink, but also to the company itself, the social meanings that drinking Coke entails, and so on and so forth. Coca-Cola went on sale as a headache and hangover remedy on May 8, 1886 at Jacob's Pharmacy in Atlanta. It was created by local pharmacist John S. Pemberton from South American cocoa shrub leaves, an extract of African kola nuts, and fruit syrup. It was Pemberton's bookkeeper who named the product 'Coca-Cola' and who suggested writing its name with the familiar flowing script that virtually everyone recognizes. The drink was subsequently promoted with such slogans as "Wonderful nerve and brain tonic and remarkable therapeutic agent" and "Its beneficial effects upon diseases of the vocal chords are wonderful." In 1891, Atlanta pharmacist Asa G. Candler acquired ownership of Coca-Cola, changing its image from a 'tonic' to that of a popular 5¢ soft drink that could be drunk together with family and friends – an image that has persisted to this day and is the basis of Coca-Cola's continued commercial success.

That image was created at first by imprinting the Coca-Cola name on drinking glasses, providing them to diners and other eateries that featured 'pop' and foods meant to be eaten quickly and cheaply. From then, Coca-Cola has coopted socially significant themes, from the brotherly love and peace espoused during the counterculture era of the late 1960s and early 1970s with its "I'd like to teach the world to sing in perfect harmony" campaign, to the "Coke is the real thing" campaign shortly thereafter, to 2000's campaigns showing Coke as the drink of Olympic athletes.

Logos

Logos (an abbreviation of 'logogriphs') are the pictorial counterparts of brand names. They are designed to reinforce the signification system for a product through the visual channel. Consider the apple logo adopted by the Apple Computer Company. As a visual iconic sign suffused with latent religious symbolism, it strongly suggests the story of Adam and Eve in the Western Bible, which revolves around the eating of forbidden fruit (probably the apple) that contained forbidden knowledge. The logo reinforces this symbolic association because it shows an apple that has had a bite taken from it. The creator of the logo, a man named Rob Janoff of Regis McKenna Advertising, has consistently denied any intent to connect the logo to the Genesis story, claiming instead that he put the bite there in order to ensure that the figure not be confused with a tomato. Whatever the truth, the bite in the logo evokes the Genesis story nonetheless.

As another example, consider the Playboy logo of a bunny wearing a bow tie. Its ambiguous design opens up at least two interpretive chains:

1. rabbit = 'female' = 'highly fertile' = 'sexually active' = 'promiscuous' = etc.
2. bow tie = 'elegance' = 'night club scene' = 'finesse' = etc.

The appeal and staying power of this logo is due, arguably, to this inbuilt dual signification system. By not being able to pin down what the actual meaning of the logo is, we start experiencing the sign holistically and, thus, as an artistic text or mysterious pictograph.

Logos have now become part of a culture-wide visual symbolism that interconnects products with daily life. Until the 1970s, logos on clothes, for instance, were concealed discretely inside a collar or on a pocket. Today, they can be seen conspicuously on all kinds of products, indicating that society has become 'logo conscious.' Ralph Lauren's polo horseman, Lacoste's alligator, and Nike's 'swoosh' symbol, to mention but three, are now shown prominently on clothing items, evoking images of heraldry and, thus, nobility. They constitute symbols of 'cool' (Klein, 2000: 69) that legions of people are seemingly eager to put on view in order to convey an aura of high class 'blue-blooded' fashionableness.

To see why logos are so powerful psychologically, consider briefly the Nike symbol, which is found on the shoe brand. As a visual sign suggesting speed, it works on several levels, from the iconic to the mythical. At the iconic level, it implies the activity of running at top speed with the Nike shoe; at the mythic level, it taps into the idea of speed as symbolic of power and conquest (such as in the Olympic races). The combination of these two signifying levels creates a perception of the logo, and thus the product, as having a connection to both reality and narrative history. Nike was the goddess of victory in Greek mythology. An ancient statue of Nike shows a winged female figure alighting on the prow of a ship, presumably to crown the ship's commander. Her garments, wet with spray and blown by her flight, whip about her body.

Given their psychological power, it is little wonder that logos are used as well by noncommercial enterprises and organizations. One of the most widely known ones is the peace sign, often worn on chains and necklaces. Derived from an ancient runic symbol

of despair and grief, it became the logo for philosopher Bertrand Russell's (1872–1970) 'Campaign for Nuclear Disarmament' in the 1950s. The logo's first widespread exposure came when it surfaced in the 1962 sci-fi film *The Day the Earth Caught Fire*, leading to its adoption by the counterculture youth of the era.

In a fundamental sense, a logo is a pictograph – a picture used to express ideas. The inbuilt emotional appeal of pictography is likely the reason why the alphabet character X has become a kind of ersatz logo for everything from movies to sports names: e.g., Nissan's X-Terra model, X-treme sports, the movie action hero 'Triple X,' XXX movies, and so on. The letter X has become a kind of 'macrologo' that is synonymous with youth, danger, and excitement, even though it has been around for centuries as the mathematical variable *par excellence*, as a signature used by those who cannot write, as a blasphemous letter assigned to cartoon bottles of alcohol and boxes of dynamite, and as a symbol marking a secret treasure on a pirate's map. 'X' has always constituted a pictography of various meanings that predate X-treme sports and X-File TV programs.

X is powerful because it conjures up images of things that are just beyond the realm of information, or beyond decency and righteousness. In today's sexually charged culture, 'X' on a product means 'Buy me, I'm X-rated and X-citing.' 'X' is, in a phrase, one of the most provocative symbols of contemporary logo culture, characterizing it in a compact yet accurate way. And the reason is, ultimately, because it reverberates with mythical symbolism that reaches back to the origin of pictography as a craft controlled by those in power. It is a modern-day hieroglyph.

The only way to explain why we extract so much meaning from a simple letter is, in fact, to see it as a product of an unconscious pattern of pictorial symbolism that continues to have emotional hold on the modern mind. Its particular design – a cross symbol that has been rotated 45 degrees – reverberates with contradiction and opposition. No wonder that advertisers, manufacturers, Hollywood moguls, and all the other image-makers of contemporary pop culture have adopted it as a symbol of 'cool.'

Conclusion

As mentioned, brands and logos are now created to name not just products, but entire corporations (IBM, Ford, etc.) and even specific characters that represent, in some way, a corporation. Take, for example, the Disney Corporation cartoon character Mickey Mouse. In 1929, Disney allowed Mickey Mouse to be reproduced on school slates, effectively transforming the character into a logo. A year later Mickey Mouse dolls went into production and throughout the 1930s the Mickey Mouse brand name and image were licensed with huge success. In 1955, *The Mickey Mouse Club* premiered on US network television, further entrenching the brand and image – and by association all Disney products – into the cultural mainstream.

Analogous 'branding events' have repeated themselves throughout modern society. The idea is to get the brand to become intertwined with cultural spectacles (movies, TV programs, etc.) and thus indistinguishable as a sign from other culturally meaningful signs and sign systems. Because of the Disney Corporation, toys, children's TV programming, childhood films, videos, DVDs, theme parks, and the like have become part of the modern perception of childhood as a Fantasyland world. This is why children now experience their childhood through such products.

Braune, Wilhelm (1850–1926)

E Einhauser, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

Wilhelm Braune belonged to the so-called 'Neogrammarians,' a group of linguists with quite a strong influence on linguistic research in the last third of the 19th century and at the beginning of the 20th century. But whereas other Neogrammarians such as Hermann Paul and Karl Brugmann became rather famous, Wilhelm Braune more or less took on the role of the decent working linguist in the background. The obituaries of his friend Eduard Sievers (1927) and of his successor Friedrich Panzer (1927) give evidence of his calm and peaceable character and of his conscientious working attitude.

As the most famous results of his diligence, Braune's *Gotische* and his *Althochdeutsche Grammatik* should be mentioned. The newest (20th) edition of the *Gotische Grammatik* only recently has been revised by Frank Heidermanns and so today is still of value as a reliable working tool. The *Althochdeutsche Grammatik*, too, has seen many editions, and even the *Althochdeutsche Lesebuch* is still in print.

Furthermore, a great part of Braune's working energy was absorbed by the *Beiträge zur Geschichte der deutschen Sprache und Literatur*, a journal he founded together with Hermann Paul in 1874 and which quickly became one of the central periodicals of the Neogrammarians (the common abbreviation PBB refers to the initials of the co-founders: Paul and Braune's Beiträge). A great deal of Braune's works were published here, among others an important essay on the history of the German language titled *Zur Kenntnis des Fränkischen und zur hochdeutschen Lautverschiebung* (1874) and a voluminous analysis of the *Handschriftenverhältnisse des Nibelungenliedes* (1900). These two titles, as well as the *Beiträge*, are representative of Braune's scientific position: he saw himself not only as a linguist but also as a Germanist, a philologist who is not interested in linguistic questions alone (see also Panzer, 1927: 159). That he was still open to new scientific trends in his later years can be seen in his essay *Althochdeutsch und Angelsächsisch* (1918), in which he took into account geographical and cultural aspects.

Braune's university career was quite unspectacular, fitting for his role as a decent worker. He studied in Leipzig, where he was mostly influenced by his teachers August Leskien, Friedrich Zarncke, and Rudolf Hildebrandt. In Leipzig he also met Hermann Paul, Eduard Sievers, Hermann Osthoff, and Karl Brugmann and hence became part of the new development in linguistics, which quite soon was named Neogrammarian. After his graduation Braune first worked as an assistant at the library at the University of Leipzig, then he gave lectures, and finally he was offered a chair at Gießen in 1880. Mainly due to the influence of Hermann Osthoff, who already taught there, he was offered a chair at the University of Heidelberg in 1888, where he lived until he died in 1926.

Brazil: Language Situation

D Moore, Museu Goeldi, Belém, Brazil

© 2006 Elsevier Ltd. All rights reserved.

Background

The indigenous population in what is now Brazil was much higher in the past, with a multiplicity of societies and languages. According to Roosevelt (1994), the oldest pottery in the New World (6000–8000 years) is found in Brazilian Amazonia, on whose flood plains dense populations, divided into chiefdoms, lived at the time of European contact. Other regions of Brazil, such as the central highlands, the semi-arid northeast, and the more temperate southern region, were likewise home to sizeable indigenous populations, most of which were destroyed or absorbed. Over 40% of the modern Brazilian gene pool is of indigenous origin.

European contact began with the arrival of the ships of the Portuguese explorer Pedro Álvares Cabral in 1500. He encountered some Tupinambá on the eastern coast of Brazil. European immigration was relatively slight for the first two centuries. European men frequently took indigenous wives, and a class of mestizos was produced, which was important in the colonizing process, during which large numbers of native people were relocated and obliged to learn the language of the mestizo, Língua Geral, or Nheengatu (Nhengatu), a Tupí-Guaraní language originally spoken on the coast that was modified by substratum effects and borrowings from Portuguese. Several dialects of Nheengatu still persist in Amazonia. With the expulsion of the Jesuits in the mid-18th century, the state assumed control over the communities of resettled native peoples (*reduções*), where the population was already declining from occidental disease.

The regions of Brazil that have been occupied the longest have the fewest indigenous societies and languages, especially eastern Brazil, where few indigenous groups still speak their language. Rodrigues (1993) estimates that 75% of the indigenous languages became extinct. The surviving native groups are mostly in remote areas, especially in Amazonia, where contact with national society has been more recent and less intensive. There are still native groups living out of contact with the outside world. Newly contacted groups still commonly lose two-thirds of their population to Western diseases – an unnecessary loss, since the diseases responsible for this loss of life and language are preventable or treatable. A number of native political organizations exist in Brazil (for example, the Coordenação de Organizações Indígenas da Amazônia Brasileira – COIAB, and the Federação de Organizações Indígenas do Rio Negro – FOIRN) and are active in debating policy and defending the interests of the communities that they represent. Indigenous affairs are under the control of the National Indian Foundation (FUNAI), and all researchers must obtain authorization from that governmental entity to enter indigenous areas, as well as approval from the National Council for Scientific and Technological Development (CNPq).

The Study of Native Brazilian Languages

Some of the earliest descriptive studies of the native languages of the New World were conducted by Jesuits in Brazil, for example, Anchieta (1595). This tradition did not take hold, however. In the 19th century and the first half of the 20th century, a number of nonspecialists, especially members of scientific expeditions, accomplished a certain amount of linguistic description. These include, notably, Karl von den Steinen, General Couto de Magalhães, Theodor Koch-Grünberg, Curt Nimuendaú, Emilie Snethlage, and João Capistrano de Abreu. Modern scientific studies of native Brazilian languages only began in the second half of the 20th century. Mattoso Câmara established the Setor de Lingüística at the Museu Nacional in 1961 and also authored a book about indigenous languages (1965), though he was not a fieldworker. During a number of years, Brazilian research on indigenous languages was mainly done at the Museu Nacional and at the State University of Campinas (UNICAMP). However, in the second half of the 1980s the study of native languages spread to other centers, especially the Federal Universities of Brasília (UnB), Goiás (UFG), Pernambuco (UFPE), and Pará (UFPA), aside from the University of São Paulo (USP) and the Museu Goeldi, which is a federal research institute in Belém.

The anthropologist Darcy Ribeiro established a cooperation agreement between the Summer Institute of Linguistics (SIL) and the Museu Nacional in 1956. This agreement was terminated in 1981, and there are now no formal ties between Brazilian academic centers and missionary organizations. Foreign missionaries have become less influential in the study of indigenous languages as their place is being taken to a certain extent by Brazilian missionaries and increasingly by professional and numerous Brazilian scientific linguists. A number of these latter have studied abroad in recent years, and upon the completion of their studies, they are strengthening the national capacity in scientific linguistics, especially in diachronic linguistics (see, for example, Meira and Franchetto, forthcoming), in recent theory and methodology, and

in overall descriptions of individual languages. The first complete grammar of a native language in decades authored by a Brazilian linguist was the description of Kamayurá by Seki (2000). More such general descriptions have been undertaken by young Brazilian linguists. There is, unfortunately, no national program for identifying and describing endangered languages in Brazil. However, a number of recent modern documentation projects with international funding have improved the level of documentation efforts. These are very popular with native groups. The small number of foreign nonmissionary linguists studying Brazilian indigenous languages has increased considerably in recent years.

Some modern information about Brazilian native languages appeared in a general work on South American languages edited by Klein and Stark (1985). Amazonia became identified as a distinct research area in linguistics with the publication of the *Handbook of Amazonian languages* series, edited by Derbyshire and Pullum (1986–1998) and the compendium edited by Payne (1990). Later useful general works with the same regional focus are those edited by Queixalós and Renault-Lescure (2000) and by Dixon and Aikhenvald (1999). These typically include languages outside of what is, strictly speaking, Amazonia, for example, the languages of the central highlands of Brazil. In recent years, volumes of the *ILLA* series have included many Brazilian languages, for example, the volumes edited by van der Voort and van de Kerke (2000) and by Crevels, van de Kerke, Meira, and van der Voort (2002).

In Portuguese, a general treatment of Brazilian languages is that by Rodrigues (1986). Rodrigues (1993) presents information on the situation of Brazilian native languages, but suffers from confusion between the number of speakers and the population size, which results in underestimating the degree of endangerment. Seki (1999) and Franchetto (2000) describe the study of indigenous languages in Brazil. Wetzels (1995) presents a collection of phonological studies. A recent collection of articles is that by Cabral and Rodrigues (2002). One Brazilian periodical dedicated exclusively to indigenous languages is *Línguas Indígenas Americanas* (*LIAMES*), of UNICAMP. The *Boletim do Museu Paraense Emílio Goeldi* contains linguistics articles in its Anthropology issues. Articles likewise appear in the journals *Revista de Documentação de Estudos em Lingüística Teórica e Aplicada* (*D.E.L.T.A.*) of the Pontífica Universidade Católica de São Paulo, the *Boletim da ABRALIN*, and the *Cadernos de Estudos Lingüísticos* of UNICAMP. Of the many NGOs working with indigenous groups, the largest and most concerned with documentation is the Instituto Sócio Ambiental (ISA), whose website is a valuable source of information and also publications (including maps) that can be purchased via the Internet. There is also a website and a listserv run by the Museu Antropológico, Universidade Federal de Goiás.

The Situation of the Native Brazilian Languages

Of course, Portuguese is the official language of Brazil. Impressionistically, Brazilian Portuguese is about as different from the Portuguese dialects in Portugal as American English is from the English dialects in Great Britain. There are many other languages spoken by immigrant communities in Brazil, especially German, Italian, and Japanese. We will focus attention here on the situation of the native languages. It must be emphasized that the information presented below is approximate, due to the lack of systematic data gathering about the situation of the native languages of Brazil. Even when population size is known, the number of effective speakers and the degree of transmission is often not known with certainty. What are considered to be different languages sometimes turn out to be dialects of the same language, often reflecting ethnic or political divisions. Much of the information is a revised version of information presented in an overview article about endangered languages in lowland South America by Moore (forthcoming), which is based on a number of sources, including Queixalós and Renault-Lescure (2000), Rodrigues (1993), Dixon and Aikhenvald (1999), the map of the Centro de Documentação Indígena (1987), the website of the Instituto Sócio Ambiental, the author's own knowledge of several regions, and personal communications from many linguists actively studying indigenous languages in various geographical areas.

Language names and the genetic classification are adapted from those of the Instituto Sócio Ambiental website, which are a 1997 adaptation of information from Rodrigues (1986). Names used by Ethnologue, if different, appear in parentheses after (note that Ethnologue's family names and categorization sometimes differ from the one used here). Population figures are normally from this same website; numbers from other sources are put in brackets. Speaker estimates are from various sources; when more than one source is used, the second is separated by placing it in brackets. Where no real information is available, the space is left blank. Since many tribal groups span national boundaries, it is important to note that all estimates are specific to Brazil and excluding speakers of those groups living in, say, Colombia or Venezuela. Likewise, the estimate of the amount of study refers to

studies carried out among speakers in Brazil, not in other countries. These estimates are very rough and can change quickly with the publication of new work.

Languages with little or no significant scientific description are rated 0; those with an M.A. thesis or several articles are rated 1, those with a good overall sketch or doctoral thesis on some aspects of the language are rated 2; and those with reasonably complete descriptions are rated 3. In the terminology used here for genetic groupings, 'family' means a group of related but different languages whose genetic relation is reasonably obvious, and 'stock' refers to a group of families whose relation is not so obvious. Because of the small size of the surviving speech communities and the precarious conditions in which they live, all might be considered to be in danger of extinction. However, it is more useful to distinguish those that are in serious, imminent danger of disappearing, either because of a low number of speakers, low transmission, or both factors. Some languages listed may already be extinct, but are listed anyway because a careful search sometimes finds remaining speakers somewhere, and that search may be abandoned if they are not listed. Languages are not considered urgently endangered if there are a reasonable number of speakers of at least one dialect or a reasonable number of speakers in another country. Larger groupings are considered first, following alphabetical order within the grouping.

Hypothetical Linguistic Stock

Macro-Jê Various authors have, on one basis or another, proposed groupings of languages often considered today as Macro-Jê. It is important to confirm or disconfirm each of the proposed genetic affiliations, some of which are not obvious. The Jê family of languages, the largest of the stock, is focused on the savanna regions of Brazil from the southern parts of the states of Pará and Maranhão south to Santa Catarina e Rio Grande do Sul. The other families of this hypothesized stock generally occur outside of Amazonia, mainly in eastern and northeastern Brazil, but with some in central Brazil and farther west. Rikbaktsa has been held to be the exception, apparently living for a long time in an Amazonian environment in northern Mato Grosso. Recent research, however, indicates that the Jabutí languages are probably Macro-Jê, as was speculated by some authors, indicating a wider and older presence in Amazonia as well. Because of their early contact with Europeans, many of the Macro-Jê languages in the east and northeast of Brazil are extinct, with or without some documentation. The last speaker of Umotína died recently (Table 1).

Major Language Families

Arawak The languages of the Arawak family, in its restricted sense, also designated Maipurean, have long been recognized as related, though proposed genetic links to other linguistic groups are more doubtful. The supposed link with the Arawá languages, for example, has no linguistic basis. The work of Noble (1965) influenced archeology, but is dubious in its conclusions. The Arawak languages are amazingly widespread, from the Caribbean to Bolivia. In Brazil, they occur in northern Pará state, on the tributaries of the Rio Negro in the northwest, along the Purus River in the west, on the tributaries of the Juruena River in Mato Grasso, and along the Upper Xingu River. The relatively numerous Terêna live in Mato Grosso do Sul. It is not certain whether or not there are still speakers of Mandawáka (Mandahuaca) in the region of the Upper Rio Negro. The Arawak languages are polysynthetic and often have gender and nominal classification (Table 2).

Carib The Carib family is centered on northern South America. The Carib languages of northern Brazil are rather similar, though Waimiri-Atroari (Atruahí) is more distant. The language called Galibi do Oiapoque is intrusive from French Guiana, where it is called Kali'na (or Carib in Surinam and Guyana). The Carib languages on or near the Upper Xingu are quite different from the northern languages and also do not constitute a single consistent subgroup (Table 3).

Pano The Pano linguistic family is not highly differentiated internally. It occurs in Peru, Bolivia, and Brazil, and is usually considered to be related to the Tacana family of Bolivia. The Brazilian Pano languages occur in the states of Acre and Amazonas, except for the Kaxararí in Randônia, and have received relatively little study. Sources are contradictory as to whether Amawáka is spoken in Brazil (Table 4).

Tucano Of the divisions of the Tucano family, Western, Eastern, and (for some authors) Central, it is mainly the Eastern branch which occurs in Brazil, though Kubewa (Cubeo), of the putative Central branch, also occurs there. Except for Arapaso, each of the Tucano languages of Brazil is also spoken in Colombia, where they have generally received more study. More recent sources doubt that Yuruti (Juriti) is spoken in Brazil. These languages are noted for tone or pitch accent, morpheme-intrinsic nasality, and complex obligatory coding of evidentiality. The languages are spoken in the region of the Vaupés, Tiquié, and Papurí Rivers. The speakers of several of them refer to themselves as Yebá-masã (Yepá-masã).

Many of these languages are quite robust, but have received little study in Brazil (Table 5).

Tupí The Tupí family consists of 10 branches, one of which, Tupí-Guaraní, spreads over a vast area, with extensions into Argentina, Paraguay, Bolivia, Peru, and French Guiana. Languages of this branch have been studied for centuries, but with more fascination for the Tupí-Guaraní dialects on the coast studied by the Jesuits, which contributed many loanwords to Portuguese and which achieved an almost classical status in Brazil, where the word 'Tupí' is sometimes used to refer to these dialects. Though Tupí-Guaraní is often thought to be somehow more central in the family, it is actually rather atypical. Awetí is apparently the branch most closely related to Tupí-Guaraní, and these two together with Mawé form a subgroup within the family. The Ramarama and Puruborá branches form a subgroup also; the other relations are not obvious and are still being worked out. Research on the Tupi families in the western state of Rondônia, often considered the original location of the Tupi peoples, is rather recent. A number of languages important for comparative Tupi studies are urgently endangered (Table 6).

Medium-sized Language Families

Arawá The Arawá languages are spoken in a relatively circumscribed region centered on the upper and middle Purus and Juruá rivers. Their maintenance is generally good (Table 7).

Katukina The Katukina family of languages (not to be confused with Katukina do Acre, a Pano language) are spoken by groups on the Javaí, Juruá, and Jutuí rivers in southern Amazonas. Recently, Adelaar (2000) presented evidence that the Peruvian family Harakmbut is genetically related to the Katukina family of languages. Their study is urgent (Table 8).

Makú The Makú languages (not to be confused with the Máku language of Roraima) are spoken by hunter-gatherer groups mainly in the region of the Vaupés, though the Nadëb live lower on the Rio Negro. The Bará (Kakua, Kakwa) language (not to be confused with the Bará (Barasana) language of the Tucano family) is spoken on the border with Colombia, and it is not clear how many live in Brazil (Table 9).

Nambikwara The Nambikwara languages occur in western Mato Grosso and southeastern Rondônia, in a region that includes both tropical forest and savanna, centered on tributaries of the Guaporé and the Juruena rivers (Table 10).

Chapakura (Txapakúra) The extant Chapakura languages are spoken in the state of Rondônia (and in Bolivia). Torá, in the state of Amazonas, is described by recent visitors as already extinct for many years. Recent ethnographers state that Urupá is extinct also. The Moré live in Bolivia, though there may be a few in Brazil (Table 11).

Yanomami The languages of the Yanomami family are spoken in Brazil and in Venezuela, by rather unacculturated groups. In Brazil these languages occur in the northern state of Roraima, near the Venezuelan border (Table 12).

Smaller Language Families

Bora Some speakers of the Miranha dialect of Bora reportedly live along the Solimões River in Brazil.

Guaikurú Kadiwéu, one of the Guaikurú languages (which tend to occur in the Chaco region of Paraguay and Argentina) is spoken in Mato Grosso do Sul in Brazil.

Jabutí The name of this family is a corruption of Djeoromitxi, one of its component languages. The languages are found in southern Rondônia.

Mura The language of the Mura and that of the Pirahã appear to have been quite close; often they are grouped under one name (Múra-Pirahã). There are occasional reports of elderly Mura speakers, though the Mura generally speak Portuguese or a dialect of Nheengatu (Table 13).

Isolated Languages

Seven languages are not known to be genetically affiliated with others. Of these, Aikanã (Tubarão), Kanoê (Kanoé), and Kwazá are in the same region in southern Rondônia. The language of the Iranxe (Irântxe) and Mynky is spoken near the headwaters of the Juruena River, in Mato Grosso. The Trumái are thought to have been relative latecomers to the Upper Xingu regional system. There is said to be only one Máku speaker, in the state of Roraima. The Tikuna (Ticuna) are numerous, living along the Solimões River, extending into Columbia and Peru. It is a sign of progress that, of these isolated languages, Kanoê, Kwazá, Mynky, Trumai, and Tikuna have received intensive modern study in recent years (Table 14).

Creole Languages

There are two groups in the northern state of Amapá, the Galibi-Marworno (Carib) and the Karipuna do Norte (Karipúna Creole French), both of whom lived for some time in French Guiana and speak creoles heavily influenced by the French-based creole of that country (Table 15).

Bréal, Michel Jules Alfred (1832–1915)

E Guimarães, Institute of Language Studies–Unicamp, São Paulo Campinas, Brazil

© 2006 Elsevier Ltd. All rights reserved.

Bréal, French linguist and one of the founders of semantic linguistics, studied Sanskrit in Berlin with Bopp and Albrecht Weber. He received his Ph.D. in 1863, defending the thesis *Hércules et Cacus. Étude de mithologie comparée* and *Des noms perses dans les ecrivains grecs*. In 1864, he became a professor of compared grammar at the Collège de France.

In 1868, he joined the group that founded the *École des Hautes Études*, where he became director and was, for a time, Ferdinand de Saussure's professor. From 1879 to 1888, he was Inspector General of French Public Instruction. His work was dedicated to three domains: the study of ancient inscriptions and myths, the study of historical and compared linguistics, and reflection on questions related to teaching.

He himself named his work in linguistics *semantics*, having been the first to use this word in a linguistic discipline (Bréal, 1883). In these studies, Bréal included himself in the historical perspective of the 19th century and considered that semantics deals with the change of the signification of words (Delesalle, 1988). He differed from the comparativists of his time (Aarsleff, 1981; Delesalle, 1980), as he considered that language does not reduce to forms and that its study must necessarily include the meaning (Bréal, 1866).

Changes in language are not natural, ruled by inevitable laws, but occur by man's willful action and intelligence. Willful action, which is not conscious, is constituted by the slow and groping agreement of the will of many, a collective will. Intelligence is a faculty of knowledge and has its origin in the functioning of the sign. Language represents an accumulation of intellectual work. Therefore, language is not a natural science; it is historical and cultural (Bréal, 1897).

In this domain, Bréal established a fundamental concept in semantics studies – that of polysemy – and this aspect can be found in the work that synthesizes the principal points of his production (1897). Willful action and intelligence change the signification of a word that, not losing its previous signification, takes on more than one meaning. Polysemy is the result of history and is one of the places that represent the accumulation of the intellectual work of the language.

Another important aspect, also present in the *Éssai de sémantique*, is what he called the subjective element. He who speaks is marked in what he spoke. In languages there are the forms that, when used, mark this presence. Personal pronouns are one of the examples of these forms, which would later be crucial in the work of Émile Benveniste.

Bredsdorff, Jakob Hornemann (1790–1841)

J van Pottelberge, Ghent University, Ghent, Belgium

© 2006 Elsevier Ltd. All rights reserved.

Though trained as a natural scientist, Jakob Hornemann Bredsdorff is remembered most of all as one of the first scientific runologists and historical linguists. He was born on April 3, 1790, in Vester Skerninge (on the island of Fyn, Denmark) into a line of highly educated Lutheran priests. After thorough preparation at home, Bredsdorff entered Nykøbing Cathedral School in 1807. Here, his language teacher was S. N. J. Bloch, a renowned philologist and pedagogue who also taught Rasmus Rask. In 1809 Bredsdorff enrolled at the University of Copenhagen, where he received a first degree in Divinity in 1814 and a doctoral degree in natural sciences in 1817. Early on in Copenhagen, if not before, Bredsdorff met Rask, with whom he was friends until the latter's death in 1832. He spent most of his career as a reader in geology and botany at the prestigious private school Sorø Academy, where he died on June 16, 1841.

Bredsdorff left a small but remarkable body of linguistic writings. He owes his special place in the history of linguistics most of all to his highly original paper *On the causes of linguistic change* (published in Danish in 1821), which provides a genuine theory of language change, with the speaker as the central locus of change. It differs fundamentally from the ideas of Rask, who treated language history in terms of natural history. Being at least 40 years ahead of its time and published in an examination program of Roskilde Cathedral School, the paper passed unnoticed. It was rediscovered and republished by Vilhelm Thomsen in 1886.

In the long-standing Scandinavian tradition of runology, Bredsdorff gave the first more-or-less correct interpretation of the runic inscription on the famous Golden Horn of Gallehus (1839), which ultimately led to today's standard transliteration by Ludvig Wimmer. He was also the first to realize that the 24-character runic alphabet was older than the more common 16-character alphabet, though he derived both erroneously from Ulfilas Gothic alphabet. His data-oriented analysis of the relationships between the Germanic languages also foreshadowed modern views, arguing that Gothic should be considered a separate branch of Germanic and not the ancestor of High German or all Germanic languages together.

Being well aware of the gap between the rough classification of sounds in orthography and the more sophisticated differentiations in pronunciation, Bredsdorff tried to develop an alphabet to represent pronunciation more accurately, which he applied to both standard and colloquial Danish in 1817.

The sources of Bredsdorff's linguistic insights have not yet been investigated; preliminary information can be found in Andersen (1982).

Breton (*brezoneg, brezhoneg*) belongs to the Brythonic branch of the Celtic languages. It is spoken in Lower Brittany, and its linguistic border is the westernmost limit of the withdrawal of Celtic before Roman expansion.

Breton has long been considered the continuation of Gaulish. Linguistic studies in the 19th century smothered all purported genetic connection between Breton and French and also any close relationship to Gaulish. Some historians argued that Breton had been imported whole by immigrants from Britain into a thoroughly romanized Armorica. Modern Celtic studies confirmed the view that Breton was a late offshoot of British Celtic. We now know that emigration from Britain began before the Saxon invasions,

Breton (*brezoneg, brezhoneg*) belongs to the Brythonic branch of the Celtic languages. It is spoken in Lower Brittany, and its linguistic border is the westernmost limit of the withdrawal of Celtic before Roman expansion.

Breton has long been considered the continuation of Gaulish. Linguistic studies in the 19th century smothered all purported genetic connection between Breton and French and also any close relationship to Gaulish. Some historians argued that Breton had been imported whole by immigrants from Britain into a thoroughly romanized Armorica. Modern Celtic studies confirmed the view that Breton was a late offshoot of British Celtic. We now know that emigration from Britain began before the Saxon invasions,

so that most scholars acknowledge that Breton is rooted in Armorican Gaulish, absorbing different varieties of British Celtic.

A traditional view of the language purports the existence of a unified old Breton, supposed to have split into four dialects, named after the dioceses as they existed before the 1789 French Revolution: Léonais for the diocese of Léon, Trégorrois for Tréguier, Cornouaillais for Cornouaille, and Vannetais for Vannes. There are, in fact, two major dialect groups: (1) KLT – Cornouaille (Kerne), Léon, Trégor and (2) Vannetais, the western border of which is the river Ellé. Falc'hun (1962, 1981) has reported the existence of an intermediate dialect centered on Carhaix, the meeting point of all the major roads, and constituting a bridge between remote linguistic forms, like the reflexes of the dental spirants from old Celtic **tt* and **d*. Léon *deiz* 'day' and *dervez* 'duration of a day' (Welsh *dydd* and *dyddwaith*) are far removed from vannetais *de* and *deùeh*. The central forms are *de* and *devez*, dropping *z* from **d* as in vannetais, but keeping *z* from **tt* as in Léon. The primitive twofold partition could reflect the difference between Osismii and Venetes Gaulish, the latter keeping closer to Armorican.

An intensity stress generally falls on the penultimate in the northwest, whereas in the Southeast a pitch stress affects the last syllable, not unlike French.

Voiceless consonants and /m/ are fortes, voiced spirants are lenes, and voiced stops and /l/, /n/ and /r/ can be either. Vowels are short before fortes and long before lenes when stressed. One can thus oppose *ar zal* 'the room' (long [a:], weak [l]) and *zall* 'salted' (short [a], strong [l]). There can be up to eight phonemic nasal vowels, which are not borrowings from French, but archaic features, as in *hañv* 'summer'.

Primitive consonants were weakened, especially between vowels. These changes survived the loss of final syllables, turning a simple phonetic mechanism into a grammatical device called 'lenition,' so that the initial consonants of feminine words are lenited after the article – originally ending in a vowel – and also the following adjective: *mamm* 'mother,' *mad* 'good,' *ar vamm vad* 'the good mother.' The geminate voiceless fortes became voiceless spirants, giving rise to the spirant mutation: *penn* 'head,' *he fenn* 'her head.' Another sandhi phenomenon caused the so-called provective mutation: a final *-h* in *hoh* 'your' devoices a following voiced initial consonant, as in *bugel* 'child,' *ho(h) pugel* 'your child.'

Final consonants are devoiced before pausa. *Ma zad* 'my father' keeps a long [a:], but a devoiced *-d* when final, the voice being restored when the utterance is followed by a vowel as in *ma zad eo* '(he) is my father'. All voiceless consonants are voiced before a vowel or *l*, *m*, *n,* and *r*. Native Breton speakers are readily recognizable in French when they pronounce *toud' la z'maine* for *toute la semaine* 'during the whole week.'

English and Breton grammars show striking similarities; for example, both use a compulsory periphrastic progressive in opposition to a simple present: *Ma breur ne gan ket* 'my brother does not sing' vs. *ma breur n'ema ket o kana* 'my brother is not singing.'

The lexis is basically Celtic (*dorn* 'fist, hand', Welsh *dwrn*, Gaelic *dorn*; *den* 'person', Welsh *dyn*, Gaelic *duine*). About 500 common words are Latin borrowings (*taol* <*tabula* 'table,' *spered* < *spiritus* 'mind,' *kistin* < *castanea* 'chestnut'). For centuries, a flow of romance and French words has enriched the language, very much like in English. Some words have been kept in both languages while disappearing from French; for example, *skourje* 'whip' from *escourgée*, *écourgée*, English *scourge*. The most important borrowings are the numerous affixes, taken both from Latin (*-adur* < *-atura* as in *skub-adur* 'sweepings') and French (*lenn-abl* 'read-able').

Polls carried out in 1991 and 1997 show that from 1950 to 1990, the percentage of Breton speakers has decreased from about roughly 70 to 20% of the population. In 2004, it is estimated that about 250 000 persons are able to speak the language, and most of them are over 60 years old. French has become dominant because of the unprecedented social and agricultural revolution occurring in Brittany.

Before 1941, there existed two written forms, called at the time 'breton vannetais' and 'bas-breton,' which had been developed in the two Jesuit colleges of Quimper and Vannes in the 17th century; each form had its own grammars, dictionaries, and literature. In 1941 the *peurunvan* 'totally unified' orthography was established. 'Cat,' *kaz* in KLT and *kah* in vannetais, would be spelled *kazh*. A new spelling called 'orthographe universitaire,' which was closer to the spoken language, was created in 1954. Finally, a third orthography, *etrerannyezhel* 'interdialectal,' was created in the 1970s to take into account all regional differences.

Both the French State and the Breton Regional Assembly have encouraged publishing in the Breton language in the last 30 years, and Breton is partially used on local state-owned (France-Bleu Breiz Izel) and private radio (like *Radio Kerne*) and television stations (France 3).

Degrees in Breton, at all levels, are delivered in Rennes and Brest. Breton language teachers have been recruited since 1982 to teach in the secondary schools. Breton is taught to about 5000 children at the primary level in a few bilingual classes in public and Catholic schools, and the private *Diwan* schools teach mostly through Breton. However, less than

1% of Breton children benefit from this bilingual education.

British Indian Ocean Territory: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

The British Indian Ocean Territories comprise an overseas territory of the United Kingdom. It consists of more than 2000 islands in the Indian Ocean to the south of India, midway between Africa and Indonesia. The territory was established in 1965, when it was slightly larger than today; in 1976 a number of islands became part of the newly independent Seychelles. Currently the British Indian Ocean Territories comprise the six main island groups that make up the Chagos Archipelago. The largest of these islands is Diego Garcia, which houses a joint U.K.–U.S. naval support facility. It is the only island that is inhabited, by approximately 1500 (U.K. and U.S.) military personnel and 2000 civilian contractors. During the establishment of the naval base (1967–1973), the local population of Ilois, mainly agricultural workers, were relocated to Mauritius and the Seychelles. There is a legal campaign to gain the right of return, but so far this has been unsuccessful, largely due to the special military status of Diego Garcia. Thus, the official (and only) language of the British Indian Ocean Territories is English.

1% of Breton children benefit from this bilingual education.

Brøndal, Rasmus Viggo (1887–1942)

F Gregersen, University of Copenhagen, Copenhagen, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Viggo Brøndal, born Rasmus Viggo Hansen on October 13, 1887, in Copenhagen, was a Danish linguist and Romance philologist. He changed his name from Hansen to Brøndal in 1912. Brøndal studied with Sandfeld and Nyrop at the University of Copenhagen and graduated as *magister artium* in Romance Philology in 1912. As a postgraduate, Brøndal studied with Bédier and Meillet in Paris for a year. In 1917 he was awarded the degree of Doctor of Philosophy by the University of Copenhagen for a dissertation on loans and substratum influences in Romance and Germanic languages. The book is heavily influenced by the sociological Meillet school and thereby atypical of Brøndal's later work. From 1917 to 1925 he worked as an assistant to the Place-Name Committee, and then returned to Paris for a three-year period where he was a reader of Danish at the Sorbonne. In 1928 he was appointed Professor of Romance Philology at the University of Copenhagen, a position that he held until his death on December 14, 1942.

Viggo Brøndal was among the founding members of the Linguistic Circle of Copenhagen (1931), and, until his premature death, he was a major force in its endeavors to further structural linguistics. In particular, he and Louis Hjelmslev together edited the *Acta Linguistica* (later *Acta Linguistica Hafniensia*) from its start (1937). Brøndal formed strong bonds with other structuralists, such as Roman Jakobson, and he functioned as the secretary general of the 1936 Copenhagen Congress of Linguists, which was presided over by his former teacher, Otto Jespersen.

Brøndal's particular kind of structuralism is of an idealist transcendent type, based on his reception of the Aristotelian categories. From his work on word classes (1928), arguably his best book, until his theory of the prepositions (1940), the vision is refined, but the outlines remain the same: The four generic concepts of *descriptum* (D), *descriptor* (d), *relatum* (R), and *relator* (r) may be combined to form what are seen as the possible linguistic categories in any specific system. Brøndal uses his categories to analyze the relation between morphology and syntax in his 1932 book on the subject and later wrote a number of papers, collected in the posthumously published *Essais de linguistique générale* (1943).

Viggo Brøndal was a fascinating orator, and the debates between him and Hjelmslev were both fierce and singularly gratifying for a whole generation of Danish linguists. Brøndal deeply influenced his immediate pupils, the Nordic philologist Paul Diderichsen, the Romance philologist Knud Togeby, and the literary historian Hans Sørensen, but none of them are seen to adhere to his theory, strictly speaking, in their later works. The theory is justly characterized by Eli Fischer-Jørgensen as a great intellectual achievement in that it seeks to capture everything linguistic with rather few but very abstract concepts and strives to treat all linguistic levels from phonology through word classes (morphology) to syntax and semantics using only these same concepts to arrive finally at a characteristic of a language – and through this – a culture. But unlike Hjelmslev's theory, Brøndal's impressive structure has remained outside the mainstream of linguistics.

Brockelmann, Carl (1868–1956)

M V McDonald

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 415–416, © 1994, Elsevier Ltd.

The German Orientalist Brockelmann was born in Rostock on September 17, 1868. While still at school, his imagination was fired by the great geographical discoveries then being made, and he showed an early interest in exotic languages. However, on entering Rostock University in 1886 he began with the study of classics as offering more secure career prospects. The award of a scholarship allowed him to move shortly to Breslau (now Wroclaw) where he studied Semitic and Indo–European philology. At this time he also taught himself Turkish, a language which was to remain an abiding interest. In 1888 he went to Strasbourg (then in Germany) in order to study under Nöldeke (*see* **Nöldeke, Theodor**. Here he occupied himself with Sanskrit, Armenian, and Ancient Egyptian. By 1892 he was once again in Breslau where he completed his *Habilitation* (on Ibn al-Jawzi), wrote his *Lexicon Syriacum*, and traveled for the first time to Turkey. While in Constantinople he made the acquaintance of Jahn, to whose chair in Königsberg he was later to succeed. These years in Breslau saw in particular the preparation of his edition of Ibn Qutayba's '*Uyūn al-Akhbār* (Berlin/Strasbourg, 1900–1908) and the first edition of his *Geschichte der Arabischen Litteratur* (Weimar/Berlin, 1898–1902).

In 1903 he was appointed to a chair in Königsberg, where he completed his own best-loved work, the *Grundriss der Vergleichenden Grammatik der Semitischen Sprachen* (Berlin, 1907–1913). In 1910 he accepted a chair in Halle, which became his hometown for the rest of his life. In 1923 he went back to Breslau, from which he finally retired to Halle in 1935. His years of retirement were overshadowed by World War II and its ensuing miseries. His son was taken prisoner at Stalingrad, only returning in the early 1950s, and his wife died in 1945. His savings became worthless, and a period of extreme difficulty was finally alleviated when in 1947 he was made librarian to the *Deutsche Morgenländische Gesellschaft* in Halle. It is said to be due to his efforts that this library was not shipped to the Soviet Union as war reparations. Even during these years, he continued to teach a number of languages, and his scholarly energies remained undimmed. He retired again in 1953 and was still working on his *Hebräische Syntax* at his death (May 6, 1956).

During his lifetime, Brockelmann produced a mass of articles and studies covering an enormous range of Semitic and Turkish studies (see Fück, 1958), centering mainly on grammar, syntax, and lexicography. He is best remembered however, by Arabists at least, for his *Geschichte der arabischen Literatur*, the final version of which appeared in Leiden (1943–1949). This is an invaluable but unwieldy work; to some extent it has been superseded by later works, but it is still indispensable, even though it is occasionally impossible to identify his references. He is one of the select band of Orientalists whose name has become a household work in the field, and a copy of 'Brockelmann' is one of the most-used works in any Arabic library.

Brosses, Charles de (1709–1777)

G Haßler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd. All rights reserved.

Charles de Brosses was born in Dijon, France, on February 7, 1709, and died in Paris, on May 7, 1777. He was a French magistrate and scholar, who came from a family of judges and studied in his home town. A classmate of Georges Louis Leclerc de Buffon (1707–1788) at Godrans Collège in Dijon, he was appointed judge at the Burgundian Parlement des États (1730), later becoming a *conseiller* (1741) and finally first president (1775). He also followed his inclination towards literature and science, and, during a visit to Italy in 1739–1740, he wrote his letters on Italy which were published posthumously. His friend Buffon solicited him to undertake the composition of his *Histoire des navigations aux terres australes* (1756). This work included many word lists and was translated into English and German. De Brosses was the first to lay down the geographical divisions of Australasia and Polynesia, which were afterwards adopted by succeeding geographers. His works on the history and origins of language earned him a reputation as a theorist in this field. He was elected to the Académie des Inscriptions in 1758.

In 1760 de Brosses published a dissertation, *Du culte des dieux fétiches*, which was afterwards inserted into the *Encyclopédie méthodique*. In this work, secretly smuggled into France after having been rejected by the Académie des Inscriptions, he developed the hypothesis that all divinities had a physical origin and that they were initially material objects adored for their own sake.

In 1765 appeared his work on the origin of language, *Le Traité de la formation méchanique des langues*. De Brosses aimed at giving a naturalistic interpretation to symbolic functioning. Language is for him primarily an organic phenomenon. 'Mechanical' was not a neutral term, but was taken from the works of Jean Baptiste le Rond d'Alembert (1717–1783), who used it to designate a part of applied mathematics which tried to explain movement and its forces. The linguistic use of the term mechanical was not invented by de Brosses, but he took it up from Noël Antoine Pluche (1688–1761), who used it in a work on the acquisition of languages by children (*La Méchanique des langues et l'art de les enseigner*, 1751). De Brosses goes further in his explanation, adopting materialist connotations of the mechanical description of the first languages. Their elements should be natural and necessary and can be found in any language. His aim was to observe the operation of the expressive movement of the body and the iconic links between the first sounds and the objects they represent. Nature is the author of the germination of sound and the first true words. The gradual evolution of languages towards arbitrariness does not eliminate this link. He developed a phonetic theory which allowed him to link words of different languages with their organic root.

Nevertheless, de Brosses's emphasis on etymology and the study of regularities of sound change does not make him a forerunner of historical linguistics. In this respect, the *Traité* was more likely a failure. De Brosses thought that we would be able to compare all languages on the basis of their organic roots and that the forms of unknown languages would fit easily into this scheme. He stressed the word in itself, independent of its relation to specific languages. Together with his thesis of a universal family of languages this emphasis produces an unbridgeable gap which separates his theory from the comparative grammar of the 19th century.

De Brosses was occupied throughout most of his life with a translation of Sallust, attempting to supply the lost chapters of that celebrated historian's work. These literary occupations did not prevent the author from efficiently executing his official duties as first president of the parliament of Burgundy, nor from carrying on a constant and extensive correspondence with the most distinguished literary figures of his time. Presenting himself as a candidate for the Académie Française in 1770, de Brosses was rejected due to the opposition of Voltaire (1694–1778) on personal grounds.

Brown, Gillian

G Yule, Kaaawa, HI, USA

© 2006 Elsevier Ltd. All rights reserved.

Gillian (Gill) Brown, with a Cambridge M.A., had already taught in Ghana (1962–1964) before becoming an assistant lecturer in Phonetics and Linguistics at Edinburgh University in 1965. After fieldwork in Uganda, Gill published an early paper in generative phonology (Brown, 1970), which became part of her Edinburgh doctoral dissertation on the phonology of Lumasaaba in 1971, and the basis of a scholarly monograph (Brown, 1972). In the 1970s, Gill's work on the practical applications of phonetics and phonology led to her widely acclaimed book on listening to spoken English (Brown, 1977/1990). Later, Gill's intonation project (1975–1979), funded by the first of many research grants, developed innovative methods of eliciting and analyzing spoken data (Brown *et al.*, 1980). Gill then combined linguistics, cognitive psychology, and the study of discourse structure to create a book that helped define the field of discourse analysis for many linguists (Brown and Yule, 1983a). Further research projects resulted in more books, two on the teaching and testing of spoken language (Brown and Yule, 1983b and Brown *et al.*, 1984), one on language understanding (Brown *et al.*, 1994) and another on referential communication (Brown, 1995). In subsequent research, Gill has focused on the ways in which context is created in discourse understanding (Brown, 1998).

While the research projects continued, Gill moved from Edinburgh (1965–1983) to become Professor of Applied Linguistics at the University of Essex (1983–1988), then to serve as the founding Director of the Research Centre for English and Applied Linguistics at Cambridge University (1988–2004), where she created a stimulating intellectual environment for graduate study in many areas at the intersection of linguistics and cognitive psychology. As one of the few women professors in these institutions at the time, Gill was increasingly involved in administration, serving as Dean of Social Sciences at Essex, in committee work, such as the University Grants Committee, and in public service, as a member of the Kingman Inquiry into English language teaching in British schools. In recognition of her outstanding work, Gill received a CBE in 1992.

As one of the few women professors in these institutions at the time, Gill was increasingly involved in administration, serving as Dean of Social Sciences at Essex, in committee work, such as the University Grants Committee, and in public service, as a member of the Kingman Inquiry into English language teaching in British schools. In recognition of her outstanding work, Gill received a CBE in 1992.

Brown, Roger William (1925–1997)

M Thomas, Boston College, Chestnut Hill, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Roger Brown was a social psychologist trained at the University of Michigan. During a 40-year-long career teaching at Harvard University and, briefly, MIT, he made at least three substantial contributions to late twentieth-century American linguistics.

First, Brown is probably best known for his 1973 study of the acquisition of English by three preschoolers. Capitalizing on the recent invention of the portable tape recorder, Brown or his graduate students visited the homes of 'Adam,' 'Eve,' and 'Sarah' weekly or every other week to record at least two hours a month of spontaneous speech. Data were collected from Eve for eleven months; from Adam and Sarah, for five years. The recordings were then transcribed and meticulously analyzed. Brown developed the technique of calculating a child's Mean Length of Utterance, measured in morphemes. Using MLU as a basis for calibrating the three children's emerging grammars, he found commonalities in how they expressed semantic relations, and in their gradual building up of grammatical and morphological complexity. Brown's transcripts and tapes were later deposited in the CHILDES online database, where they have had lasting influence on the study of child language acquisition.

Second, Brown was extraordinarily effective as a teacher. He trained a cohort of students who have had distinguished careers in diverse subfields of linguistics and psycholinguistics, including Jean Berko Gleason, Ursula Bellugi, Melissa Bowerman, Courtney Cazden, Kenji Hakuta, Howard Gardner, Michael Maratsos, Steven Pinker, Eleanor Rosch, and Dan Slobin. Kessel's (1988) *festschrift* provides a fuller list of Brown's students and showcases their writings.

A third contribution Brown made is related. Not all of Brown's students inherited his distinctive working style (self-described as "phenomenon-centered," "low-tech, minimally mathematical" with "an almost Talmudic taste for poring over data … involving nothing but the free exercise of the principles of induction" [1989: 49–50]), but it set a particular tone to the emerging discipline of psycholinguistics. Moreover, in person and in his best-selling textbooks (1958, 1965), Brown modeled open-mindedness, intellectual playfulness, and an unfailing sense of wonder that attracted many to the study of language.

Brown's work on Adam, Eve, and Sarah achieved such prominence that it is surprising to learn that he published nothing on child language after the midpoint of his career. However, he left behind diverse work on linguistic relativity, music and language, tip-of-the-tongue phenomena, and the sociolinguistics of politeness. He also left behind a painful memoir (Brown, 1997) that meditates on the afflicted personal life of a man celebrated as much for his geniality as for his professional success.

Brücke, Ernst (1819–1891)

P C Sutcliffe, Colgate University, Hamilton, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Ernst Wilhelm Ritter von Brücke (b. June 6, 1819, d. January 7, 1892), not to be confused with his grandson and biographer, Ernst Theodor Brücke, was a physiologist who taught for 46 years, 41 of them as Professor of Physiology at the University of Vienna (1849–1890). Brücke was classically educated, which gave him a thorough foundation in Greek and Latin and a broad humanistic interest in languages and learning. Then he studied medicine, primarily in Berlin with physiologist Johannes Müller, who encouraged him to apply his physiological expertise to developing a natural system of speech sounds with which all the world's languages could be described (Jankowsky, 1999: 247). It is his groundbreaking works in this field, most especially *Grundzüge der Physiologie und Systematik der Sprachlaute für Linguisten und Taubstummenlehrer* (1856), for which he is remembered in linguistic, and particularly phonetic, history, although he had 140 publications in all.

In his first work on speech physiology, *Untersuchungen über die Lautbildung und das natürliche System der Sprachlaute* (1849), Brücke laid the foundation for *Grundzüge*, painstakingly describing various pronunciations of all the vowels and consonants and arranging them in a system according to genetic criteria, introducing terms such as alveolar and dental still in use today. Apparently, Brücke was unaware of Ellis's *Essentials of phonetics* (1848) as he wrote it (*see* **Ellis, Alexander John (né Sharpe) (1814–1890)**), so he essentially developed a natural system of speech sounds with no help from predecessors, except for some observations by Kempelen (*see* **Kempelen, Wolfgang von (1734–1804)**). In the 7 years between *Untersuchungen* and *Grundzüge*, Brücke deepened his observation of languages with help from colleagues in Vienna, including Miklosich (*see* **Miklošič, Franc (1813–1891)**) for Slavic and Anton Hassan for Arabic languages. He also realized a further practical application for his now 'fine-tuned' system: as a tool for teachers of the hearing-impaired (Jankowsky, 1999: 246).

Although Brücke's *Grundzüge* was superseded by Sievers's *Grundzüge der Lautphysiologie* in 1876 (*see* **Sievers, Eduard (1850–1932)**), Brücke's work provided the physiological description linguists had lacked and laid the foundation for this later work. He was extremely influential on Sievers and his generation, and also on Sigmund Freud. Scherer (*see* **Scherer, Wilhelm (1841–1886)**) and Sweet (*see* **Sweet, Henry (1845–1912)**) are among those who used and praised his work.

Brugmann, Karl (1849–1919)

K R Jankowsky, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Karl Friedrich Christian Brugmann (see Figure 1) was born on March 16, 1849 in Wiesbaden. He graduated from high school in his home town in 1867, studied philology for one year in Jena, then decided to move on to Leipzig, where he selected as his major subject comparative philology, with Georg Curtius (*see* **Curtius, Georg (1820–1885)**) becoming his principal teacher. His doctoral thesis of 1871, entitled *De Graecae linguae productione suppletoria*, was followed in 1877 by his *Habilitationsschrift, Zur Geschichte der Nominalsuffixe -as-, -jas- und -vas-* (published in *Zeitschrift für*

Figure 1 Photograph of Karl Brugmann from *Idg. Jahrbuch* IV (1918). Retrieved from http://titus.uni-frankfurt.de/personal/galeria/brugmann.htm.

vergleichende Sprachforschung 24: 1–99), qualifying him as a university teacher. Before that he had obtained his *Staatsexamen* in 1872 and taught high school, for one year in Wiesbaden, then at the Nicolai-Schule in Leipzig. In 1877 he started his university career, first lecturing on Sanskrit and comparative philology in Leipzig, where he was appointed associate professor (*Extra-Ordinarius*) in 1882. Two years later he went to Freiburg as full professor (*Ordinarius*) and stayed there for three years, only to return to Leipzig for good in 1887 to occupy the newly established chair for Indo-European philology. He died in Leipzig on June 29, 1919.

Brugmann was the most productive of the Neogrammarians and undoubtedly also the one who commanded the greatest influence on language students who streamed to Leipzig from all over the world. Apart from the enormous impact through the substance of his writings, his unparalleled success was to a large extent also due to his unique personal style and courage. As a young man of 27, he broke with his mentor Curtius, who could not approve of Brugmann's impatient zest for exploring even less conventional avenues if he thought that it furthered the advancement of his science. And from then on he embarked on a course of quiet but determined confrontation. This frame of mind was the basis for the second feature that aided his climb to unprecedented prominence. Within a short time after he entered the teaching profession, Brugmann managed to establish himself as an arbiter of what should be acceptable as solid linguistic achievement and what would have to be discarded as insignificant.

When he sat in judgment, his criteria were derived from solid research that he and his Neogrammarian comrades-in-arms kept supplying in abundance. Even before Brugmann had started teaching at the university level, his first two major studies, written in 1876, brought him recognition and fame that continued to grow rapidly with every work he produced. Of the approximately 400 titles in his list of publications, two above all others were instrumental in solidifying his reputation as the unchallenged leader in the field, and even today those works remain achievements that need to be consulted. The first is the *Griechische Grammatik* of 1885, a model treatment of all components of grammar from a comparative point of view; the second, his *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (vols. 1, 2, 6). Following Franz Bopp (*see* **Bopp, Franz (1791–1867)**) and August Schleicher (*see* **Schleicher, August (1821–1868)**), he was the third scholar to attempt a comprehensive documentation of what comparative linguistics had accomplished at his particular time. To achieve this monumental task, he had to restrict himself to phonology and morphology of the eight principal Indo-European languages, leaving it to Berthold Delbrück (*see* **Delbrück, Berthold (1842–1922)**) to deal with syntax (vols 3–5).

As was characteristic of all Neogrammarian scholars, Brugmann was truly fascinated by discovering and securing as many relevant linguistic facts as he possibly could. But he, as did most of his Neogrammarian friends, went far beyond the mere amassing of facts in that he successfully attempted to arrive at the formulation of the basic principles that govern those facts and place them within a coherent system.

Bruneau, Charles (1883–1969)

D Candel, CNRS and University of Paris, Paris 7, France

© 2006 Elsevier Ltd. All rights reserved.

Charles Bruneau graduated from the Sorbonne and then followed Gilliéron's classes on dialectology at Ecole des Hautes Etudes. He received a position at the University of Nancy in 1913 and at the Sorbonne in 1933. In 1934 he succeeded his former professor, Ferdinand Brunot, as chair of History of French Language and remained there until 1954. Born in the French Ardennes, Bruneau focused his thesis on the local dialects in 93 villages of this region (*Etude phonétique des patois d'Ardenne*). In 1912 he was called by Ferdinand Brunot to participate in the 'Archives de la parole,' the first institutional oral survey. This was based on using a Pathé phonograph to collect phonograms. An automobile to transport their 500 kilograms of recording equipment was even made available to them, quite an innovation at that time.

Bruneau first used the method of questionnaires learned from Edmont and Gilliéron for the *Atlas linguistique de la France*, asking for translations of words and sentences into the local dialect. This gave a large amount of speech facts. As he explained in several letters written to Brunot (available at the Archives du département de l'audiovisuel from the Bibliothèque Nationale de Paris) he then changed his method, preferring to analyze his speakers' free speech and accents, instead of comparing the words or phrases he solicitated from them. Brunot and Bruneau finally gathered 166 recordings that they filed following the Viennese 'Phonogrammarchiv,' marking the geographical particularities of the samples, as well as some biographical data describing the speakers, and giving a phonetical transcription of the records.

After he settled in Paris, Bruneau contributed to Ferdinand Brunot's monumental *Histoire de la langue française des origines à nos jours* by writing 'L'Epoque romantique' (covering the period 1815 to 1852) and 'L'Epoque réaliste' (covering the period 1852 to 1886). These two volumes mostly describe the history of literary language through stylistic monographies, different from the rest of Ferdinand Brunot's work. Around 1952 Bruneau, arguing against Spitzer's stylistic criticism, made a distinction between pure (or scientific) stylistics, and stylistics applied to literature (or authors' stylistics), the former being part of language science.

Brunei Darussalam: Language Situation

C H Gallop

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 419–420, © 1994, Elsevier Ltd.

Brunei Darussalam is an independent sultanate on the northwest coast of Borneo. There are four districts: Brunei Muara (where the capital is situated), Belait, Tutong, and Temburong (an enclave in the adjoining Malaysian state of Sarawak). The population is 75% Malay, with the largest minority group being Chinese (15%).

The official language is Bahasa Melayu (Standard Malay), the variety jointly accepted by Malaysia, Indonesia, and Brunei Darussalam. It is widely used in all areas of public life, including government, the printed media, and broadcasting. English is also understood and spoken in various domains of public and private life.

The education system is bilingual, with academic subjects, including the sciences, taught in English, while culturally based subjects and Islamic religion are in Malay. Malay is now written in romanized form, but learning of the original Jawi script, an adaptation from Arabic, is currently being revived in schools. Three Islamic religious institutions use a combination of Arabic, Malay, and English. The majority of students at the University of Brunei Darussalam (opened in 1985) study in English.

Seven communities are accepted by the 1959 constitution as being indigenous groups of the Malay race. Brunei Malay is the dialect of the numerically and politically dominant people of that name who have traditionally lived on water. Kedayan is the dialect of the land-dwelling farmers. These two variant dialects of the Brunei Muara district are each about 80% cognate with Standard Malay. The other five communities, the Tutong, Belait, Dusun, Bisaya, and Murut, speak the languages of their names. The Bisaya and Murut reside only in Temburong. All five languages are less than 40% cognate with Brunei Malay. Their use is declining in favor of Brunei Malay due to population mobility, intermarriage, and, for Dusun, Bisaya, and Murut, conversion to Islam. Iban, Penan, and Mukah are Sarawak languages spoken only by small groups of settled immigrants. The urban Chinese use mainly the Hokkien, Cantonese, and Hakka dialects.

A national ideology, the Malay Islamic Monarchy concept, is being promoted in education and public life. It characterizes Brunei Darussalam as a monocultural, Malay-speaking, Islamic society, and is contributing to the decline of minority languages.

Brunei Darussalam: Language Situation

C H Gallop

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 419–420, © 1994, Elsevier Ltd.

Brunei Darussalam is an independent sultanate on the northwest coast of Borneo. There are four districts: Brunei Muara (where the capital is situated), Belait, Tutong, and Temburong (an enclave in the adjoining Malaysian state of Sarawak). The population is 75% Malay, with the largest minority group being Chinese (15%).

The official language is Bahasa Melayu (Standard Malay), the variety jointly accepted by Malaysia, Indonesia, and Brunei Darussalam. It is widely used in all areas of public life, including government, the printed media, and broadcasting. English is also understood and spoken in various domains of public and private life.

The education system is bilingual, with academic subjects, including the sciences, taught in English, while culturally based subjects and Islamic religion are in Malay. Malay is now written in romanized form, but learning of the original Jawi script, an adaptation from Arabic, is currently being revived in schools. Three Islamic religious institutions use a combination of Arabic, Malay, and English. The majority of students at the University of Brunei Darussalam (opened in 1985) study in English.

Seven communities are accepted by the 1959 constitution as being indigenous groups of the Malay race. Brunei Malay is the dialect of the numerically and politically dominant people of that name who have traditionally lived on water. Kedayan is the dialect of the land-dwelling farmers. These two variant dialects of the Brunei Muara district are each about 80% cognate with Standard Malay. The other five communities, the Tutong, Belait, Dusun, Bisaya, and Murut, speak the languages of their names. The Bisaya and Murut reside only in Temburong. All five languages are less than 40% cognate with Brunei Malay. Bruner, Jerome Seymour (b. 1915)

W A Hass, St Peter, MN, USA

© 2006 Elsevier Ltd. All rights reserved.

Jerome Bruner is a pre-eminent, powerfully influential, and multiply pioneering psychologist whose studies have touched on language in many ways.

Born in New York City of nominally observant Jewish parents, he was blind for the first two years of life. His father, a watchmaker, died when he was 12, after which his family moved about, and he developed his interest in sailing. He attended Duke University (B.A., 1937), and went to Harvard for graduate study in psychology (Ph.D., 1941). He served in the U.S. Army Intelligence Corps in World War II, applying his knowledge of propaganda and public opinion. He then joined the Harvard faculty, doing experimental psychological research on the dependence of perception on motivation (the 'New Look' studies). He carried out an enormously influential series of studies on the acquisition of structured cognitive categories, involving the grouping of instances on the basis of values of defining attributes. He founded and directed the Center for Cognitive Studies in the 1960s, leading the way toward the field's mentally realistic engagement with information processing. He left Harvard for the Watts Professorship of Experimental Psychology, at Wolfson College, Oxford University, in 1972, personally sailing across the Atlantic to assume his new role, and then returning to the United States in 1979. He has subsequently taught at the New School for Social Research (New York City) and the New York University School of Law. His research interests progressed from cognitive to developmental and educational psychology, where his thinking has galvanized our understanding of pedagogical practice, and then on to cultural and narrative psychology, providing specimen studies exemplifying another novel and productive paradigm for human studies.

His abiding interest in language began with his work on wartime propaganda and public opinion, more or less by-passed his perceptual experiments, and continued with his analyses of conceptual categorization. Despite personal contacts with George A. Miller, Noam Chomsky, Roman Jakobson, and Roger Brown, he never became enamored of the structural properties of syntactic or phonological grammars. For instance, it was Brown who added a 65-page appendix to *A study of thinking*, indicating how attributes and categorizations are involved in speech and linguistic meaning.

He became interested in language development, as epitomizing a symbolic, in contrast to iconic or enactive, system of representation and cultural 'amplifier' of reflective, in contrast to sensory or motoric, capacities. From language as an instrument of thought, based on semantic representation, he went on to treat language development in terms of communicative (or pragmatic) function. This perspective allowed him to combine prior American pragmatic and generative influences, with Oxfordian 'ordinary language' work on Austinian illocutionary acts, as well as Tinbergen's ethology – in his delineation of the ontogenesis of speech acts. He went on to the formulation of the Language Acquisition Support System, through which speakers became participants with particular linguistic communities or subcommunities. In this way, he could emphasize not only cultural influences, but also narrative structures and processes. He based his account of stories on Kenneth Burke's pentad (Agents, Actions, Goals, Instruments, Settings – plus Trouble!), as well as other structural accounts and hermeneutic modes of human intentionality. Narratives, thus conceived, have properties that allow construction of personal selves/identities, as well as human institutions (such as schools and legal systems), and provide for the dynamics of individual development/aging and or human history (the passing forward of culture).

His prolific career has provided contributions sufficient to suggest several approaches to the role of language in the human sciences, but reflects a general trend from the application of his original experimental psychology to his more recent anthropological/interpretive stance. He has managed to combine an engagement in current political, educational, and legal issues, as they have become crucial over the decades, with a principled perspective stemming from meaning-based psychological research and theory – which he has helped shape and vitalize. His has not been a 'school of psycholinguistics,' but rather a schooling of psychological engagement in human language.

Brunot, Ferdinand (1860–1938)

D Candel, CNRS and University of Paris 7, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Alumnus of Ecole Normale Supérieure (1879), Ferdinand Brunot ranked first in the 'Agrégation de grammaire' competition of 1882, got his doctorate in 1891, and a tenured position at the Sorbonne in 1900, in a new chair in 'History of French Language' specifically created for him. At Ecole Normale he was trained by the philologists Gaston Paris and Arsène Darmesteter. Under the influence of Clédat he worked on 'patois' and on spelling. His friends were Baudrillart, Bergson, Jaurès, and the sociologist Durkheim. Brunot became politically engaged and was a convinced 'republican.' He was on the side of Dreyfus, helped found the Human Rights League and later became a mayor of Paris.

He created the monumental *Histoire de la langue française*. He wrote the first 10 parts in 18 volumes, over 10 000 pages: the emphasis is placed on language as a human and social phenomenon, on historical philology, and on both the internal history and the external geography of language, while proposing the first steps of a social lexicology. This work reached 26 volumes, the latest ones, covering the period 1870 to 2000, were published by CNRS. Brunot's other substantial work is *La Pensée et la langue* (1922), a French grammar including oral usages that are based on a classification of ideas more than of signs, forms, and grammatical categories.

This well-recognized philologist, who was a member of the 'Académie des Inscriptions et Belles Lettres' and of the 'Académie Royale de Belgique,' and who also inspired the teaching of stylistics in France, got some fresh reactions from linguists: Bourciez and Meillet criticized the large number of facts and the absence of a system; Meillet and Bally, the process of starting from concepts to get to the language; Bally, the mixing of syntagm and paradigm, and of synchrony and diachrony. As a polemist, Brunot published a critique of the 1932 French Grammar of the Académie Française. As an innovator, he strongly encouraged spelling reform. He also became involved in training teachers of French as a foreign language.

Brunot created the Institut de Phonétique of the University of Paris and the 'Archives de la parole' (1911), in order to record and store samples of 'patois' (from Ardennes, with Bruneau, and from Berry Limousin). He also recorded and stored samples of average Parisians' speech and politicians', poets', and actors' voices (Barrès, Dreyfus, and Apollinaire). This was the beginning of the Département de l'audiovisuel at the Bibliothèque Nationale de France.

Buck, Carl Darling (1866–1955)

R D Greenberg, Yale University, New Haven, CT, USA

© 2006 Elsevier Ltd. All rights reserved.

Born in Bucksport, Maine in 1866, Carl Darling Buck was an expert in historical linguistics, especially the history of the Italic branch of Indo–European. Having completed his undergraduate studies at Yale in 1886, he continued his graduate studies there for another 3 years. He then moved to Europe, where he studied classical languages in Athens (1887–1889) and Leipzig (1889–1892). Buck joined the University of Chicago in the year of its founding, 1892, as a professor of Sanskrit and Indo-European comparative philology. He remained at this post until his retirement in 1933, when he became professor emeritus. In his retirement, Buck remained active in his scholarship, working on his reverse dictionary of Greek nouns and adjectives co-authored with Walter Petersen (1945) and his dictionary of synonyms in the Indo–European languages (1949). In 1954, the University of Chicago honored him as one of three surviving individuals who had been at the University since its founding. Buck died the following year.

During his remarkable career, Buck made significant contributions in the areas of the Oscan and Umbrian languages, including a study of these languages' vocalic systems (1892) and verbal forms (1895). Together with William Gardner Hale, he produced a grammar of Latin (1903), and in the next year his grammar of Oscan and Umbrian appeared. Before the end of the first decade of the 20th century, Buck had also produced studies of ancient Greek dialects. However, many students of Indo–European linguistics may know Buck best through his comparative grammar of Greek and Latin (1933) and his dictionary of Indo–European synonyms (1949). These works have endured as classic reference books in historical linguistics.

Buddhism has had major linguistic influences in Japan, ranging from the development of classical Japanese literary forms and new syllabaries to the use of a wide vocabulary that has, in the course of time, become part of standard Japanese usage. It entered Japan along with many other facets of continental Asiatic culture from the 6th century onward. Along with Buddhism, the most significant cultural influence that entered Japan in this period was the Chinese writing system, which the Japanese adopted. It was through the medium of Buddhist texts written in Chinese that the Japanese originally encountered and studied Buddhist thought. This Chinese orientation provided the predominant lens through which the Japanese viewed and learned about Buddhism. Until the 19th century, no systematic attempts were made to study such root languages of Buddhism as Sanskrit or Pali or to study early pre-Chinese Buddhist texts. There was, however, in the work of the 18th century writer Tominaga Nakamoto, a recognition of the conditional nature of language, dependent on the time in which it was used, the form of expression used, and the intent of the user. Tominaga's studies of Buddhist texts and of the varying ways

that Sanskrit terms had been translated, in different eras and by different authors, into Chinese enabled him to come to an understanding of the relative nature of language and of religious forms and to develop the foundations of a critical scholarship of religion and of Buddhist texts.

The entry of Buddhism into Japan led the Japanese to study Chinese culture in depth and, especially, to embark on an intensive study of the Chinese language and its writing system so as to facilitate study of the new religion. Consequently, the entry of Buddhism was a powerful spur toward the Japanese adoption of the Chinese writing system. It also proved to be a major medium for its gradual transformation into a Japanese system, for in order to make the texts more readily comprehensible they were read in a Japanese syntactical style that applied Japanese pronunciations to the ideograms. Even in the early 1990s, Japanese Buddhist priests intoned, with Japanese pronunciations, texts written in Chinese. Because few understand Buddhist Chinese, this has led to a situation in which most priests and worshippers do not understand the meanings of the texts they recite. Large numbers of contemporary Japanese translations and commentaries on Buddhist texts are, however, available to explain such texts.

Buddhism played a major part in the development and use of the phonetic syllabary *katakana*, which forms an intrinsic part of the written language along with Chinese ideograms. *Katakana* developed as a mnemonic device for providing Japanese readings and pronunciations of Chinese Buddhist texts and was widely used in the temples of Nara, the ancient capital, by the 8th century. Its use was subsequently diversified into the world of literature and eventually into general use. Although the earliest usages and development of the other phonetic syllabary, *hiragana*, occurred outside of Buddhist temples, it is clear that this syllabary was also widely used in the Buddhist world by the 10th century, and this further stimulated the emergence of an authentic written language combining ideograms and phonetic script.

Many Buddhistic words still in use in the late 20th century (e.g., the term *issai shujô*, 'all sentient beings') derive from the earliest wave of assimilation in the 6th century: although changes in the dominant form of Chinese in the 7th century affected the ways that the Japanese pronounced most Chinese ideograms, the Buddhist temples resisted this change and continued for the most part to preserve the earlier forms. For example, the ideogram meaning 'being, existence' is more commonly pronounced *sei*, but in Buddhist contexts generally retains the earlier pronunciation *jô*. To this extent, Buddhist Japanese as used in rituals has a rather archaic feeling compared to standard Japanese. Nonetheless, many standard Buddhist terms based on these earlier forms of pronunciation, for example, *jigoku* ('hell') and *gokuraku* ('heaven'), have become everyday terms still extant in contemporary Japanese and not limited to Buddhistic usage. Because of its close relationship with the Chinese language, which formed the basis of the Japanese writing system and which added immeasurably to the Japanese vocabulary of the time, Buddhism has thus played an instrumental role in the evolution of the Japanese language and in augmenting its scope, both orally and in written forms.

Buddhism, Tibetan

J Powers, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

During the 7th century, Tibet was an expanding military power. Its armies conquered large parts of China's Central Asian territories, but as it came into contact with more advanced civilizations, Tibet became increasingly aware of its cultural backwardness. One consequence of this was the decision by King Songtsen Gampo (ca. 618–650) to send his advisor Tönmi Sambhota to India to develop a written script for the Tibetan language. With the help of Indian *pandit*s, he developed a script based on north Indian models that is still used today.

Although Tibetan histories written centuries later by Buddhist clerics present Songtsen Gampo as an emanation of the Buddha Avalokiteśvara whose primary goal in life was to spread Buddhism, there is little evidence that he had any real interest in the religion. Some of his successors, however, became

that Sanskrit terms had been translated, in different eras and by different authors, into Chinese enabled him to come to an understanding of the relative nature of language and of religious forms and to develop the foundations of a critical scholarship of religion and of Buddhist texts.

The entry of Buddhism into Japan led the Japanese to study Chinese culture in depth and, especially, to embark on an intensive study of the Chinese language and its writing system so as to facilitate study of the new religion. Consequently, the entry of Buddhism was a powerful spur toward the Japanese adoption of the Chinese writing system. It also proved to be a major medium for its gradual transformation into a Japanese system, for in order to make the texts more readily comprehensible they were read in a Japanese syntactical style that applied Japanese pronunciations to the ideograms. Even in the early 1990s, Japanese Buddhist priests intoned, with Japanese pronunciations, texts written in Chinese. Because few understand Buddhist Chinese, this has led to a situation in which most priests and worshippers do not understand the meanings of the texts they recite. Large numbers of contemporary Japanese translations and commentaries on Buddhist texts are, however, available to explain such texts.

Buddhism played a major part in the development and use of the phonetic syllabary *katakana*, which forms an intrinsic part of the written language along with Chinese ideograms. *Katakana* developed as a mnemonic device for providing Japanese readings and pronunciations of Chinese Buddhist texts and was widely used in the temples of Nara, the ancient capital, by the 8th century. Its use was subsequently diversified into the world of literature and eventually into general use. Although the earliest usages and development of the other phonetic syllabary, *hiragana*, occurred outside of Buddhist temples, it is clear that this syllabary was also widely used in the Buddhist world by the 10th century, and this further stimulated the emergence of an authentic written language combining ideograms and phonetic script.

Many Buddhistic words still in use in the late 20th century (e.g., the term *issai shujô*, 'all sentient beings') derive from the earliest wave of assimilation in the 6th century: although changes in the dominant form of Chinese in the 7th century affected the ways that the Japanese pronounced most Chinese ideograms, the Buddhist temples resisted this change and continued for the most part to preserve the earlier forms. For example, the ideogram meaning 'being, existence' is more commonly pronounced *sei*, but in Buddhist contexts generally retains the earlier pronunciation *jô*. To this extent, Buddhist Japanese as used in rituals has a rather archaic feeling compared to standard Japanese. Nonetheless, many standard Buddhist terms based on these earlier forms of pronunciation, for example, *jigoku* ('hell') and *gokuraku* ('heaven'), have become everyday terms still extant in contemporary Japanese and not limited to Buddhistic usage. Because of its close relationship with the Chinese language, which formed the basis of the Japanese writing system and which added immeasurably to the Japanese vocabulary of the time, Buddhism has thus played an instrumental role in the evolution of the Japanese language and in augmenting its scope, both orally and in written forms.

Buddhism, Tibetan

J Powers, Australian National University, Canberra, Australia

© 2006 Elsevier Ltd. All rights reserved.

During the 7th century, Tibet was an expanding military power. Its armies conquered large parts of China's Central Asian territories, but as it came into contact with more advanced civilizations, Tibet became increasingly aware of its cultural backwardness. One consequence of this was the decision by King Songtsen Gampo (ca. 618–650) to send his advisor Tönmi Sambhota to India to develop a written script for the Tibetan language. With the help of Indian *pandit*s, he developed a script based on north Indian models that is still used today.

Although Tibetan histories written centuries later by Buddhist clerics present Songtsen Gampo as an emanation of the Buddha Avalokiteśvara whose primary goal in life was to spread Buddhism, there is little evidence that he had any real interest in the religion. Some of his successors, however, became

devout Buddhists, and they began the process of translating the Indian Buddhist canon into Tibetan. The Tibetan language is part of the Tibeto-Burman language family, and aside from the codifications of Tönmi Sambhota (who adopted case endings and other features of Sanskrit), there is no linguistic similarity between it and Indic languages. As a result, Tibetan translators of Sanskrit texts decided to create a specialized vocabulary, which was codified in standard lexicons, as well as an artificial grammar and sentence structure for their translations that reflected those of Sanskrit Buddhist texts.

Contemporary Tibetan scholars make a distinction between two forms of Tibetan: (1) 'dharma language' (*chos skad*), which is the canonical language devised for scriptural translation, and (2) 'colloquial language' (*phal skad*), which is used for day-to-day conversation among Tibetans. Both share the same grammar and syntax, but differ in their vocabulary. Largely due to the sponsorship of Tibetan governments, a vast corpus of Indic Buddhist texts was translated into Tibetan, and in the 14th century the scholar–monk Pudön (1290–1364) compiled a standard canon, which is still normative today.

The 'first dissemination' (*snga dar*) of Buddhism to Tibet began in the 7th century under the patronage of Tibet's kings, but stalled after the early dynasty fell. In the 11th century, the Indian master Atiśa (982–1054) traveled to Tibet and initiated the 'second dissemination' (*phyi dar*) of Buddhism. His mission was so successful that from this point forward, Buddhism became the dominant religion in the region.

Tibetan Buddhism historically derived from two primary sources: (1) the monastic universities of northern India and (2) tantric lineages based mainly in Bengal and Bihar. One of the most important Tibetan innovations was the system of reincarnating lamas (*sprul sku*), the most important of which is the Dalai Lama lineage. This began in the 16th century, when Sönam Gyatso (1543–1588) was given the title "*Ta le*" ('Ocean') by the Mongol chieftain Altan Khan. The fifth Dalai Lama, Ngawang Losang Gyatso (1617–1682), was made ruler of Tibet in 1642 with the help of Mongol supporters, and his successors remained the temporal and religious leaders of the country until 1950, when troops of the Chinese People's Liberation Army invaded the country. In 1959, the 14th Dalai Lama, Tenzin Gyatso (1935–), fled into exile in India. Since that time, Chinese control over religion has intensified, and currently there is no real religious freedom in Tibet. Buddhism has been revived in exile, however, and study and practice thrive in Tibetan exile communities in South Asia.

Karl Bühler (see **Figure 1**) was born in Germany (Meckesheim) in 1879 and, after gaining a doctorate in philosophy and medicine, started work as an assistant to Oswald Külpe, a psychologist in Würzburg. Later he worked as a professor of psychology in Dresden and Vienna (1922–1938), before having to emigrate to the United States in 1938, where he lived in Los Angeles from 1945 until his death in 1963.

In linguistics Bühler is most famous for his work on deixis and on language function, but he also published work on developmental psychology, language comprehension, and human cognition as well as on other linguistic phenomena such as phonology, syntax, morphology, and stylistics.

Bühler postulated four axioms for linguistics, which were concerned with (1) the organon model of language, (2) the sign status of language (by virtue of *abstract* features), (3) the field structure of language (Bühler united von Humboldt's dichotomy of *ergon* and *energeia* and de Saussure's distinction between *langue* and *parole* in his *Vierfelderschema* of language as *Sprechhandlung*, *Sprachwerk*, *Sprechakt*, and *Sprachgebilde*), and (4) the fact that language is a system of two 'classes' (*Zweiklassensystem*), namely semantics and syntax. Of these four axioms, it was especially the organon model that was influential.

Bühler, Karl (1879–1963)

M Bednarek, University of Augsburg, Augsburg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Karl Bühler (see Figure 1) was born in Germany (Meckesheim) in 1879 and, after gaining a doctorate in philosophy and medicine, started work as an assistant to Oswald Külpe, a psychologist in Würzburg. Later he worked as a professor of psychology in Dresden and Vienna (1922–1938), before having to emigrate to the United States in 1938, where he lived in Los Angeles from 1945 until his death in 1963.

In linguistics Bühler is most famous for his work on deixis and on language function, but he also published work on developmental psychology, language comprehension, and human cognition as well as on other linguistic phenomena such as phonology, syntax, morphology, and stylistics.

Bühler postulated four axioms for linguistics, which were concerned with (1) the organon model of language, (2) the sign status of language (by virtue of *abstract* features), (3) the field structure of language (Bühler united von Humboldt's dichotomy of *ergon* and *energeia* and de Saussure's distinction between *langue* and *parole* in his *Vierfelderschema* of language as *Sprechhandlung*, *Sprachwerk*, *Sprechakt*, and *Sprachgebilde*), and (4) the fact that language is a system of two 'classes' (*Zweiklassensystem*), namely semantics and syntax. Of these four axioms, it was especially the organon model that was influential.

Figure 1 Karl Bühler. With permission of the Archiv der Universität Wien.

The Organon Model

In his *Organonmodell* Bühler took up Plato's proposal to explain language by virtue of the metaphor of language as a tool (Greek *órganon*) that serves distinct functions in society. He distinguished between three functions: *Darstellung* ('representation'), *Ausdruck* ('expression'), and *Appell* ('vocative', 'appellative'). In very simple terms, language may be used for the representation of things (*Dinge: Darstellung*), for the expression of the speaker's inner feelings/states (*Sender: Ausdruck*), and for influencing the hearer's behavior (*Empfänger: Appell*). The linguistic sign is hence functionally very complex: it is a ***symbol*** by virtue of its representational function, a ***symptom*** (sign, index) by virtue of its dependence on the sender, and a ***signal*** by virtue of its appeal to the hearer. In a given instance, one of these functions may dominate the others: *Darstellung* dominates in scientific language, *Ausdruck* in poetic language, and *Appell* in military language, but this does not mean that the other functions are not present as well (Bühler speaks of *Dominanzphänomene*). Thus, an expression such as *es regnet* ('it's raining') denotes a meteorological event (*Darstellung*). But by uttering it with different intonations, the speaker can also express his/her feelings (*Ausdruck*) or appeal to someone not to forget to bring an umbrella (*Appell*) (1982: 46). Because of Bühler's occasionally imprecise style of writing, aspects of this model remain much-discussed in European linguistics. For instance, it is not clear to what extent means of *Ausdruck* are employed intentionally or subconsciously and to what extent they are conventionalized. Although some of his examples include conventional and intentional expressions, *Ausdruck* is defined by him as "freie oder gehemmte Entladung von Affekten" (1982: 352), i.e., the free or inhibited discharge of emotions, which seems to more or less *subconsciously* 'mirror' the speaker's mental state or personality traits (Auer, 1999: 33). From a strict viewpoint, this function thus does not concern linguistics (Konstantinidou, 1997: 36; cf. also Péter, 1984: 245; Stankiewicz, 1964: 239f.); however, Bühler's expressive function has also been interpreted as referring to intentional linguistic communication.

The 'Field Theory' of Language

Bühler also developed his own contextual language theory, the *Zweifelderlehre* ('two-field theory'). Signs, he said, are not isolated entities but always occur in context, in a 'field' that can be deictic (*Zeigfeld*) or symbolic (*Symbolfeld*). As such, linguistic signs function as *Feldgeräte*. Representational symbols can be interpreted solely with the help of the *Symbolfeld*, but in order to assign meaning to utterances containing deictic signals (*Zeigwörter*), hearers need the extralinguistic context (the *Zeigfeld*). What is designated by expressions such as *here, there, I, you* changes according to the position of the speaker. Thus, it is the *I*, *now*, and *here* that establishes the deictic center (Bühler calls it the *Ich-jetzt-hier-Origo)*. The matter is more complicated because there are several *modi* of pointing toward the context of utterance: *ad oculos* (reference to components of the current context), *anaphorisch* (reference to textual components), and *am Phantasma* (reference to fictional worlds).

Bühler's contribution to linguistics is enormous: apart from crucially influencing linguistic research (especially the Prague School) before World War II, his work has been of great importance in linguistics since the 'pragmatic turn' in the 1970s, although he failed to gain the deserved attention upon his emigration to the United States. His *Organonmodell* has been immensely significant in that it influenced the establishment of derived functional models from Roman Jakobson to Dell Hymes and M.A.K. Halliday. He is still being reinterpreted and analyzed within modern linguistics (e.g., Kubczak, 1984; Péter, 1984; Auer, 1999). Similarly, his comments on deixis, morphology, and metaphor have provided a stepping stone for modern approaches in these fields. His estate is currently being reorganized by the FDÖP (*Forschungsstelle und Dokumentationszentrum für österreichische Philosophie*).

Bulgaria: Language Situation

A G Angelov, University of Sofia, Sofia, Bulgaria

© 2006 Elsevier Ltd. All rights reserved.

The Bulgarian language is spoken mainly in the central and eastern Balkans. There are also Bulgarian-speaking minorities or language islands in the regions of Banat (Catholic settlers on the territory northwest of the Balkans, cf. Stojkov, 1967), Bessarabia and Tavria (emigrants in Moldova and Ukraine, Stojanova, 1997), Albania (Hristova, 2003), northern Greece (Shklifov and Shklivova, 2003), and Turkey (Bojadzhiev, 1991). If, to this population, which identifies itself as Bulgarian, one adds the speakers of the Macedonian language – the majority of whom also considered themselves Bulgarians until 1944, when the Macedonian language was created (cf. Kočev *et al.*, 1994; Bozhinov and Panayotov, 1978; Angelov, 2000) – the number of Bulgarian speakers may reach 10.5 million.

Bulgarian is also used as a first language for educational purposes by various minorities in Bulgaria: Turks, Roma, Russians, Armenians, and Jews (Angelov and Marshall, 2005), although after signing the European Framework Convention for the Protection of National Minorities in 1999, the Bulgarian Ministry of Education started to include some minority languages in its educational programs. According to the last census (March 2001) Turks are the largest minority in Bulgaria (758 000 or 9.5% of the whole population). They are mainly rural (63%), concentrated in northeast and southeast of the country, speaking Turkish dialects, probably different from Standard Turkish. During the last 15 years, after the democratic changes, Turks have their own media and role in the public administration. Roma (last census records 365 797, but other sources 650 000) are heterogeneous, differing by origin, religion, language, and dialects. Some Roma are Christians, other are Muslims (part of them speakers of Turkish); they live across the country in urban ghettoes or village neighborhoods. They have a huge number of non-government organizations (NGOs), but lack coordination, and do not have their own media, as the Turks do. Russians (30 000), Armenians (14 000), and Jews (3000) are mainly urban populations, each of them with specific cultural traditions and religious institutions.

The sociolinguistic situation in the country presents also some alleged, smaller minority groups and confessional communities. The Pomaks, called also Bulgarian Mohammedans (Muslim Bulgarians) are located in Rhodopi Mountains. They speak archaic Bulgarian dialect, although they started to learn Turkish in the 1990s as a step-mother tongue. Gagaouz (few villages in north-east Bulgaria), counter to the

Bulgarian is also used as a first language for educational purposes by various minorities in Bulgaria: Turks, Roma, Russians, Armenians, and Jews (Angelov and Marshall, 2005), although after signing the European Framework Convention for the Protection of National Minorities in 1999, the Bulgarian Ministry of Education started to include some minority languages in its educational programs. According to the last census (March 2001) Turks are the largest minority in Bulgaria (758 000 or 9.5% of the whole population). They are mainly rural (63%), concentrated in northeast and southeast of the country, speaking Turkish dialects, probably different from Standard Turkish. During the last 15 years, after the democratic changes, Turks have their own media and role in the public administration. Roma (last census records 365 797, but other sources 650 000) are heterogeneous, differing by origin, religion, language, and dialects. Some Roma are Christians, other are Muslims (part of them speakers of Turkish); they live across the country in urban ghettoes or village neighborhoods. They have a huge number of non-government organizations (NGOs), but lack coordination, and do not have their own media, as the Turks do. Russians (30 000), Armenians (14 000), and Jews (3000) are mainly urban populations, each of them with specific cultural traditions and religious institutions.

The sociolinguistic situation in the country presents also some alleged, smaller minority groups and confessional communities. The Pomaks, called also Bulgarian Mohammedans (Muslim Bulgarians) are located in Rhodopi Mountains. They speak archaic Bulgarian dialect, although they started to learn Turkish in the 1990s as a step-mother tongue. Gagaouz (few villages in north-east Bulgaria), counter to the

Pomaks, are Christians who speak a Turkish dialect. Catholics (found in small towns and villages as Chiprovtsi, Rakovski, and Bardarski Geran) are related with the Bulgarian minority of Banat in Romania.They use specific archaic Bulgarian, which has a written norm, based on Latin alphabet and influenced by Croatian liturgical tradition.

Modern Bulgarian, spoken by 99% of the population of the country, including the bilingual minorities (10–15%), is a South Slavic language which stems from Old Church Slavonic (Old Bulgarian, according to Leskien, 1919; Mladenov, 1929; Vaillant, 1948; Duridanov, 1993). The beginning of the Bulgarian literary tradition was laid by the brothers SS Cyril and Methodius, who are now recognized as the inventors of the Glagolitic, an alphabet that corresponds accurately to the phonetic peculiarities of the Slavic languages. The New Testament was translated into this new literary language as early as the 9th century, along with a number of other liturgical books and mediaeval ecclesiastical writings. The Cyrillic was named after St. Constantine-Cyril the Philosopher, and its invention is ascribed to St. Clement of Ohrid (c. 830–916), the most prominent disciple of the two brothers, who was ordained by Bulgaria's Tsar Simeon (893–927) 'first bishop of the Bulgarian language' in 893. Today the Cyrillic is used in Bulgaria as well as Russia, Ukraine, and Serbia; it was also used until recently in Mongolia and some other ex-Soviet republics.

In the 16th, 17th, and 18th centuries the Bulgarian language changed significantly (Mirchev, 1963), although it preserved its rich vocabulary (Gerov, 1995) and script. Modern Bulgarian has a somewhat different grammar (Weigand, 1907; Beaulieux, 1933; Scatton, 1984; Hauge, 1999; Kotova and Yanakiev, 2001) and an analytic structure. Bulgarian has nine tenses, a developed system of aspect and moods, intensive use of prepositions and impersonal constructions, but no case declension in the noun; the three main cases are preserved in the personal pronouns. Thus the grammatical structure of Bulgarian differs from that of the other Slavic languages (Ivanchev, 1988).

There were probably significant dialectal differences on Bulgarian language territory as early as the Middle Ages, but the varied relief of the Balkans produced a considerable number of dialects within a comparatively small geographical region (Stojkov, 1993). There are two main spoken variants in Bulgarian—Eastern and Western, which can be traced along the northeast axis from the Danube River to the Aegean, i.e., parallel to the Black Sea coast but around 300 to 350 km inland on the central Balkans. Bulgarian dialects are still used in the highland villages of the Rhodopi Mountains and the Central Balkan Range, as well as in the Rila, Pirin, and Strandja mountains. In urban conditions the traditional dialects have evolved into interdialects, influenced by the urban social environment and Standard Bulgarian (Videnov, 1990; Videnov and Angelov, 1999; Dimitrova, 2004).

The modern Bulgarian literary standard was established in the late 19th century (Gyllin, 1991; Hill, 1992; Georgieva *et al.*, 1989) on the basis of the Northeastern Bulgarian dialects, although the capital city, Sofia, lies in the western part of the country. This gap has resulted in some cultural and linguistic disproportions; however, they do not disrupt the continuum in communication. Actually there are no language barriers between the Slavic peoples even on a far larger geographical territory that covers the South and East Slavic languages. Various genres of fiction and poetry have developed in Modern Bulgarian, especially in the 19th and 20th centuries, as well as stylistic registers used in public administration, science, and education. Specific urban slang, professional jargons, and sociolects have also emerged naturally; e.g., 'tarikatski jargon' of Sofia (Armjanov, 1993) is still typical of the young generation, in the same way it was used in some urban folksongs during the 1920s.

Bulgarian

J Miller, University of Auckland, Auckland, New Zealand

© 2006 Elsevier Ltd. All rights reserved.

Bulgarian is a South Slavic language, along with Slovene (Slovenian), Macedonian, and the Serb-Croatian linguistic complex. Geographically Bulgarian is also a Balkan language and shares a number of phonetic, grammatical, and lexical features with Rumanian (Romanian), Greek, and Albanian. For instance, Rumanian and Albanian have schwa in stressed syllables and so does Bulgarian, the only Slav language with this property.

Bulgarian has two sets of dialects, Eastern and Western (further subdivisions are recognized). A major difference is in the reflexes of the Common Slavic jat vowel, roughly equivalent to 'ye' as in English *yet*. In the North Eastern dialects the jat vowel became 'ja' in a stressed syllable and followed by a syllable with a back vowel. Elsewhere it became 'e.' Standard Bulgarian, based on the North Eastern dialects, has the 'ja' – 'e' alternation, in, e.g., adjectives: *bjalo* 'white' (neuter singular) versus *beli* (plural).

The Common Slavic 'l' and 'r' plus jer (extra-short vowel) and syllabic 'l' and 'r' became 'ŭr' and 'ŭl' in polysyllabic words before two consonants and 'rŭ' and 'lŭ' elsewhere: *skŭrben* 'sorrowful'; 'prŭv' (first-person masculine) versus 'pŭrva' (first-person feminine). Consonants are palatalized or non-palatalized, as in other Slav languages.

Bulgarian has lost the Slavic case-suffixes but has developed definite articles, attached to the first word in noun phrases: Bulgarian *knigata* 'the book,' *kniga* 'a book,' *novata kniga* 'the new book,' *nova kniga* 'a new book.' In written Bulgarian masculine nouns

Bulgarian

J Miller, University of Auckland, Auckland, New Zealand

Bulgarian is a South Slavic language, along with Slovene (Slovenian), Macedonian, and the Serb-Croatian linguistic complex. Geographically Bulgarian is also a Balkan language and shares a number of phonetic, grammatical, and lexical features with Rumanian (Romanian), Greek, and Albanian. For instance, Rumanian and Albanian have schwa in stressed syllables and so does Bulgarian, the only Slav language with this property.

Bulgarian has two sets of dialects, Eastern and Western (further subdivisions are recognized). A major difference is in the reflexes of the Common Slavic jat vowel, roughly equivalent to 'ye' as in English *yet*. In the North Eastern dialects the jat vowel became 'ja' in a stressed syllable and followed by a syllable with a back vowel. Elsewhere it became 'e.' Standard Bulgarian, based on the North Eastern dialects, has the 'ja' – 'e' alternation, in, e.g., adjectives: *bjalo* 'white' (neuter singular) versus *beli* (plural).

The Common Slavic 'l' and 'r' plus jer (extra-short vowel) and syllabic 'l' and 'r' became 'ŭr' and 'ŭl' in polysyllabic words before two consonants and 'rŭ' and 'lŭ' elsewhere: *skŭrben* 'sorrowful'; 'prŭv' (first-person masculine) versus 'pŭrva' (first-person feminine). Consonants are palatalized or non-palatalized, as in other Slav languages.

Bulgarian has lost the Slavic case-suffixes but has developed definite articles, attached to the first word in noun phrases: Bulgarian *knigata* 'the book,' *kniga* 'a book,' *novata kniga* 'the new book,' *nova kniga* 'a new book.' In written Bulgarian masculine nouns

take different subject and oblique forms of the article: (*j*)*at* and (*j*)*a*. In spoken Bulgarian (*j*)*at* is typically not used.

Bulgarian has preserved the Indo-European tense-aspect system of imperfect and aorist alongside the newer perfective-imperfective system. Typically, imperfect suffixes are added to imperfective stems and aorist suffixes to perfective stems. Bulgarian does offer examples of perfective stems with imperfect suffixes in subordinate clauses introduced by, e.g., *shtom* 'as soon as' and in main clauses; they express a completed action that is repeated. The following example (1) is from Feuillet (1995: 36).

(1)	Vecher	sedneshe	na	chardaka
	Evening	*sit-down–3SG*	*on*	*verandah-DO*

'In the evening he would sit down on the verandah'

Sedn is perfective and *-eshe* is imperfect.

There are two future constructions, one for assertions and the other for denials. The former structure uses the particle *shte*, derived from the verb *xoshtõ* 'I want/wish.' The meaning 'want' is now expressed by *iskam*, cognate with the Russian *iskat'* 'search for'. Compare (2) and (3).

(2a)	Dimo	shte	dojde	utre
	Dimo	*particle*	*come-PERF-3SG*	*tomorrow*

'Dimo will come tomorrow'

(2b)	azshte	dojda	utre
	I particle	*come-PERF-1SG*	*tomorrow*

'I will come tomorrow'

(3)	az	iskam	da	dojda
	I	*want-IMPERF-1SG*	*conjunction*	*come-PERF-1SG*

'I want to come'

The future-conditional still consists of a verb (originally the imperfect of *xoshtõ*) plus a *da* complement clause: *shtjax da dojda* 'I would come,' *shteshe da dojdesh* 'you would come.'

The negative future construction consists of the invariable *njama*, originally a negative form of *imam* 'have,' plus a *da* clause, as in (4).

(4a)	Donka	njama	da	dojde
	Donka	*not-have-IMPERF-3SG*	*conjunction*	*come-PERF-3SG*

'Donka won't come'

(4b)	az	njama	da	dojda
		not-have-IMPERF-1SG	*conjunction*	*come-PERF-1SG*

'I won't come'

Ne shte occurs, but the *njama* construction is the norm.

Bulgarian has a perfect as well as a perfective: Bulgarian *chetox* 'I read' (last week) versus *chel sŭm* 'I have read.' *Chel* is the perfect participle (originally resultative) and *sŭm* is the copula. Both Bulgarian and Macedonian have developed another perfect, with a passive (resultative) participle and *imam* 'I have': compare ***angazhiral*** *sŭm masa* 'I have booked a table,' where *angazhiral* expresses a property of the speaker, and *imam angazhirana masa* 'I-have booked a-table,' where *angazhirana* expresses a property of table.

Bulgarian has what Bulgarian linguists call a renarrative construction. It is based on the perfect and past perfect. De Bray (1980: 123) talks of the past perfect as used in renarration; Feuillet talks of the use of the perfect and past perfect to signal distance or inference. That is, neither recognizes a separate renarrative tense. Examples are in (5); see Feuillet (1995: 41).

5(a)	Kazal	na	Bozhura,	che
	He-supposedly-said	*to*	*Bozhura*	*that*
	shtjal	da	se	vurne
	he-would	*conjunction*	*self*	*return*

'He is supposed to have told Bozhura that he would return'

5(b)	Kaza	na	Bozhura,	che
	He-said	to	Bozhura	*that*
	shtjal	da	se	vurne
	he-would	*conjunction*	*self*	*return*

'He told Bozhura that he would return'

(3a) demonstrates a Balkan feature, a lack of infinitives. Where Russian, for example, has an infinitive, Bulgarian has a finite clause. Bulgarian has two principal subordinating conjunctions, *da* and *che*. *Da* is used for irrealis clauses; in (4a) the event of Donka coming is not a fact but a possibility. In (6) (from Feuillet, 1995) the event of his looking at the traffic is irrealis; he is not doing it. In (7), in contrast, the event of Donka coming is presented as fact, and the clause is introduced by *che*.

(6)	Toj	varveshe,	bez	da
	He	*was-walking*	*without*	*conjunction*
	obrashta	vnimanie	na	dvizhenie-to
	turns	*attention*	*to*	*traffic-the*

'He was walking without paying attention to the traffic'

(7)	Tja	kaza,	che	Donka	shte	dojde
	'She	said	that	Donka	will	come'

Da was originally a marker of irrealis main clauses, a function which it still has in modern Bulgarian.

Bulgarian has a relativizer *kojto* (masculine), *kojato* (feminine), and *koeto* (neuter), with the plural *koito*. It is used as a free relative: *kojto pie tazi rakija e glupak* 'whoever drinks this rakija is an idiot,' and as a relativizer in relative clauses, as in (8).

(8)	knigata,	kojato	kupix
	book-the	*which*	*I-bought*

'the book which I bought'

The structure preposition plus relativizer is used: *knigata, v kojato chetox tezi dumi* 'the book in which I read these words.' Spoken Bulgarian has a relative clause introduced by the invariable *deto* 'where': *knigata DETO ja kupikh* 'the book that I bought,' *momcheto deto dojde* 'the boy that came.' It also has a relative clause structure with *shto* ('what') and resumptive pronoun: *kniga, shto ja kupikh* 'the-book that it I-bought.'

Despite the lack of case suffixes Bulgarian has flexible word order because of clitic personal pronouns (see Feuillet, 1995: 52–55). The personal pronouns have long and short (clitic) forms: *mene me* (me-accusative), *mene mi* (me-dative), *nego go* (him-accusative), and so on. Consider the question–answer pair in (9).

(9) Chete li ja Dimo novata kniga?
Read Q it Dimo new-the book?
'Did Dimo read the new book?'
Dimo ja chete novata kniga
Dimo it read new-the book
'Dimo read the new book'

(9) is neutral; it asks simply if this event took place, not whether it was Dimo doing it or someone else, or if it was the new book that was read or something else. The order *novata kniga ja chete Dimo* highlights *ja chete Dimo*; the pronoun *ja* signals that *novata kniga* is the direct object of *chete*. The order *novata kniga,* ***Dimo*** *ja chete*, with focal stress on *Dimo*, puts contrastive highlighting on *Dimo*: 'As for the book, it was Dimo who read it and not anyone else.'

Bulgarian Lexicography

D Stantcheva, Berlin-Brandenburg Academy of Sciences, Berlin, Germany

© 2006 Elsevier Ltd. All rights reserved.

Bulgarian lexicography began much later than that of most other European languages. This was largely due to the decline of the early Bulgarian literary culture, after the Turkish destruction of the second Bulgarian empire at the end of the 14th century. The literary culture did not begin to revive until 1762, the beginning of a period known as the Bulgarian Renaissance which lasted until 1878 (the end of the Russian–Turkish war).

Pioneer dictionaries in Bulgarian include a manuscript of a Bulgarian–Greek word index from Bogasko, near Kastoria (16th century); *Chetiriezichen rechnik*, by Daniil of Moschopolis (1802); *Dodatak k Sanktpeterburgskim sravnitel'nim rechnitsima sviiu eziki*, by Vuk Karadzhich (1822); and the manuscripts *Gr"tsko-b"lgarski razgovornik* and *Gr"tsko-b"lgarski rechnik*, by Zakhariĭ Krusha (1828). However, these works had no influence on subsequent Bulgarian lexicographical tradition, which developed as a part of the Bulgarian Renaissance, or on the development of New Bulgarian as a literary language. Works from the Renaissance period can be classified as follows:

1. Purist compilations: these include the word indexes in *Bolgarska gramatika* by Neofit Rilski (1835) and *P"rvichka b"lgarska gramatika* by Ivan Bogorov (1844), and a dictionary entitled *Rechnik na dumi turski i gr"tski v iazika b"lgarskiĭ* (1855) by Mikhail Pavlev and Aleksandur T. Zhivkov.
2. Dictionaries of foreign words that have enriched the Bulgarian vocabulary: these include *Kratkiĭ rechnik za chuzhdestrannite rechi, koito sia nakhozhdat v b"lgarskiĭ iazik* (1863), by Teodor Khrulev, and thesauri as appendixes to various books by Anastas Kipilovski, Petko R. Slaveĭkov, Sava Radulov, and Mikhail Popovich.
3. Bilingual dictionaries: chief among these are *An English and Bulgarian vocabulary in two parts* (1860) by Charles Morse and Konstantin Vasiliev, and *Frensko-b"lgarski rechnik* (1869)

The structure preposition plus relativizer is used: *knigata, v kojato chetox tezi dumi* 'the book in which I read these words.' Spoken Bulgarian has a relative clause introduced by the invariable *deto* 'where': *knigata DETO ja kupikh* 'the book that I bought,' *momcheto deto dojde* 'the boy that came.' It also has a relative clause structure with *shto* ('what') and resumptive pronoun: *kniga, shto ja kupikh* 'the-book that it I-bought.'

Despite the lack of case suffixes Bulgarian has flexible word order because of clitic personal pronouns (see Feuillet, 1995: 52–55). The personal pronouns have long and short (clitic) forms: *mene me* (me-accusative), *mene mi* (me-dative), *nego go* (him-accusative), and so on. Consider the question–answer pair in (9).

(9) Chete li ja Dimo novata kniga?
Read Q it Dimo new-the book?
'Did Dimo read the new book?'
Dimo ja chete novata kniga
Dimo it read new-the book
'Dimo read the new book'

(9) is neutral; it asks simply if this event took place, not whether it was Dimo doing it or someone else, or if it was the new book that was read or something else. The order *novata kniga ja chete Dimo* highlights *ja chete Dimo*; the pronoun *ja* signals that *novata kniga* is the direct object of *chete*. The order *novata kniga,* ***Dimo*** *ja chete*, with focal stress on *Dimo*, puts contrastive highlighting on *Dimo*: 'As for the book, it was Dimo who read it and not anyone else.'

and *B"lgarsko-frenski rechnik* (1871), both by Ivan Bogorov.

4. Unfinished projects of monolingual explanatory dictionaries: these include *Bulgarski rechnik* (1856) by Naĭden Gerov, with a Russian translation section (only part *A–vleka* was completed); *Slovar na b"lgarskiia ezik, izt"lkuvan na cherkovnoslavianski i gr"tski ezik* (1875) by Neofit Rilski, with a Greek translation section (only letters *A–B* were published); *B"lgarski rechnik. S"birane sichkite nashi dumi, posreshchnati s frenski i ist"lkuvani d"lgo i shiroko b"lgarski* (1881) by Ivan Bogorov, with a French translation section (only the first five letters were completed); *B"lgarski rechnik s t"lkuvanea i primeri* (1871) by Ivan Bogorov (only part *A–vdl"bnat* was published); and a manuscript of a monolingual explanatory dictionary by Petko R. Slaveĭkov (1827–1895), in which only parts of the letters *A*, *B*, *V*, and *G* are preserved.

Two pioneering monolingual dictionaries with Russian translation sections appeared at the end of the 19th century: *Slovar' bolgarskogo iazyka po pamiatnikam' narodnoĭ slovesnosti i proizvedeniiam' noveĭseĭ pechati* (1885–1889) by Aleksand"r Diuvernua, and the five-volume *Rechnik na b"lgarskyĭ ezyk' s' t"lkuvanie rechi-ty na b"lgarsky i na*

russky (1895–1904) by Naĭden Gerov, with a supplementary volume (1908) by Todor Panchev (a facsimile of the six volumes was published in 1978). Both works concentrate on colloquial vocabulary and are important lexicographical records of the formation of New Bulgarian. Based on these two dictionaries is the unfinished *B"lgarski t"lkoven rechnik* (1927–1951) founded by Stoian Argirov, Stefan Mladenov, Aleksand"r Teodorov-Balan, and Ben'o Tsonev; this work was continued by Stefan Mladenov and renamed *B"lgarski t"lkoven rechnik s ogled k"m narodnite govori*. Only letters *A–K* were completed. A number of monolingual dictionaries were published in the early 20th century; these include the first dictionary of synonyms by Mariana Dabeva (1930–1934); *Entsiklopedichen rechnik na chuzhdite dumi* (1939) by Georgi Bakalov, a dictionary of foreign words; and Stefan Mladenov's *Etimologicheski i pravopisen rechnik na b"lgarskiia knizhoven ezik* (1941), the first etymological dictionary and the first codification of Bulgarian orthography. In the second half of the 20th century, Bulgarian lexicography began to expand rapidly and is currently thriving, supported by the Bulgarian Academy of Sciences (BAS) in Sofia and by the universities of Sofia, Veliko Turnovo, Plovdiv, and Shumen. During the past 60 years, a great number of modern dictionaries have appeared, each with a different linguistic approach and editorial aim (see Table 1). The major scholarly record of the Bulgarian language is *Rechnik na b"lgarskiia ezik* by Kristalina Cholakova *et al.* (this work, in progress since 1977, had 11 volumes published by 2002, up to *oiam se*).

Since 1998, the BAS has worked to create an electronic corpus of the Bulgarian language. The corpus is representative of all major registers of the Bulgarian language and is being continually enlarged and updated. It can be expected to have an important effect on the future of Bulgarian lexicography.

In addition to practical dictionary making, numerous theoretical metalexicographical works have been published (the most important of which are included in the following bibliography), in which lexicography is generally viewed as a branch of lexicology. The Department for Bulgarian Lexicology and Lexicography at BAS is an institutional member of European Association of Lexicography (Euralex) and publishes the lexicographic journal *Leksikograficheski pregled*.

Bullokar, William (c. 1531–1609)

W Viereck, Universität Bamberg, Bamberg, Germany

© 2006 Elsevier Ltd. All rights reserved.

William Bullokar was a persistent spelling reformer who provided evidence about the pronunciation of English toward the end of the 16th century. From his books we can glean some information about his life. Born of a Sussex family about 1530, he spent at least one period of military service abroad, namely in Le Havre, which had been occupied by the English in 1562 and 1563. Several years earlier, Bullokar had been a teacher. In 1570 he married the daughter of an alderman of Chichester and, 4 years later, moved to the Chichester parish of St. Andrews, where he died in early 1609. His son John was the author of the 1616 book *An English expositor: teaching the interpretation of the hardest words used in our language* (reprinted in 1971). In 1585 his father had published for John the book *The short sentences of the wyz Cate* in his spelling system.

About 1574, Bullokar started to devise a remedy for the state of English orthography. He did not try to substitute traditional spelling for a phonetic one. Rather, he essentially kept the historical orthography and attempted to indicate the pronunciation by means of diacritical marks above and below the graphemes. However, he did not completely succeed in this and often allowed himself to be influenced by the traditional writing system. He laid down his orthographic system of 37 letters in his *Amendment of orthographie for English speech* of 1580. Bullokar had several of his books printed in his script, namely a collection of fables (*Aesopś fablź*, 1585), as well as his grammatical treatises. His system was, however, too complex to be adopted for English generally. The pronunciation mirrored in his works seems basically to have been that of the London middle class, that is, of Standard English, which lower-class people strove for. On the other hand, Bullokar retained a good many dialectisms and vulgarisms, some of which were imported into the standard language during the 17th century. Bullokar also wrote the first English grammar in English. However, he followed William Lily's *Grammatica Latina* very closely. Still, some of his observations are noteworthy, such as those on phrasal verbs.

Burkina Faso: Language Situation

B Coulibaly

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 1, pp. 430–432, © 1994, Elsevier Ltd.

Burkina Faso is a multilingual and multiethnic country. A distinction must be made between the official language, French, and the national languages. Indeed, the constitution of the Fourth Republic stipulates under Section II, article 35: 'French is the official language. The methods by which the national languages are to be promoted shall be laid down by law.' Among the national languages, there is a distinction between majority languages, which are used as lingua francas, and local, minority languages.

French

French, as stated, is the official language of administration, foreign affairs, the judicial system (Supreme Court and High Court of Justice, etc.), and of formal education (both primary and secondary schools and universities).

French is also the language that allows further access to other foreign languages (mainly English, with German in second place). French is even the means of access to other national languages. It is the 'Strait Gate' through which all desirous of state employment must pass. Thus, French is the language of initial education for most of those who are literate. According to the 1985 census, 73.37% of literate people (i.e., 12.1% of the population) are literate in French.

All this demonstrates just how privileged a position the French language occupies, and it doubtless explains why the national languages are flooded by French expressions. In this respect, no area of lexis is immune. But this influence only concerns lexis: the syntax, phonology, and morphology of the respective languages are not, or hardly, affected. Thus, those who attain mastery of the French language are limited in number. At a rough estimate they make up some 10% of the population. They live mainly in the large towns. The remaining 90% use only the national languages as their means of expression.

The National Languages

The main issues to be considered are the number of national languages, their geographical distribution, the division into language families, and the extent to which people are bi- or multilingual.

How Many National Languages Are There?

Tiedrebeogo and Yago (1983) speak of 60 languages used by a population then estimated at 5 600 000 people. Of these 60 languages, only 36 have been studied linguistically, and 18 are the object of National Subcommissions. The aim of these Subcommissions, under the general direction of the National Commission (set up on January 17, 1969), is to undertake, carry out, and promote the study of the various national languages and to teach adult literacy in them.

The languages concerned are, in alphabetical order: Bisa (Lala: Bisa), Bobo, Bwamu, Cerma, Dagara (Dagara Northern), Fulfulde, Gulmancema (Gourmancéma), Jula, Kar (Karaboro, Eastern), Kasem, Lobiri (Lobi), Lyele (Lyélé), Moore (Mòoré), Nuni, San, Senufo (Sénufo, Senara), Songhai (Songhay), and Tamasheq (Tamasheq, Kidal).

Language Families and Geographical Distribution

The languages found in Burkina Faso mostly belong to three main groups: the Gur languages group or Voltaic group (Moore, Gulmancema, Kasem, Dagara, etc.); the Mande group (Jula, Dafing (also known as Marka), Bobo, San, Bisa) and the West Atlantic group represented by Fulfulde. These three groups correspond to the three language types accepted by Houis as representing the totality of African languages, i.e., the 'economic' type, the type with differentiated morphology, and the intermediate type. The Mande languages are examples of the first type, with their open syllable (CV) structure, productive compound word morphology, lack of nominal classes, etc.; the languages with differentiated morphology are represented by the only West Atlantic language, namely Fulfulde, which has closed syllable structure, nonproductive compound word morphology, extensive nominal classes, etc., and, finally, there are the Gur or Voltaic languages that represent the intermediate type with both open and closed syllable structure, fairly extensive nominal classes, etc. Tiedrebeogo and Yago (1983) list the following as languages used for interethnic communication: Moore, Jula, and Fulfulde. In general terms, Moore is used in the center of the country, Jula in the west, and Fulfulde in the northeast, but each of the three languages extends well beyond these areas and they thus behave, given their general use, as true lingua francas.

Bilingual and Multilingual Areas

According to I. Nacro (*Plurilingualism and education in Africa: a sociolinguistic approach to the situation in Upper Volta, 1984)*, there are four bilingual areas in Burkina Faso:

1. The west is notable for the existence of a whole host of minority languages. Indeed, 71.42% of the national languages are located in this area. This state of affairs has benefited Jula, which is used as a second language by several ethnic groups, such as the Bobo, Bwaba (Bwamu), Senufo, Dagara, Lobiri, Samo, Gouin (Cerma), Turka, Toussian, Siamu (Siamou), etc. Each of these groups automatically uses Jula when unable to communicate with anyone in their native language.
2. The central southern area where Moore is used as a second language by the Bisa.
3. The central northern area where Moore is used as a second language by the Peul.
4. Finally, the north where the Tamasheq and the Bela use Fulfulde as their second language.

The large towns, and especially Ouagadougou and Bobo-Dioulasso, form multilingual areas. Apart from the three languages listed above, French and Bobo (in Bobo-Dioulasso), are spoken there.

For What Purposes Are the Various Languages Used?

Despite the low prestige they enjoy, the national languages are the subject of some attention on the part of the government authorities. Since 1969, a certain number of official measures have been taken and instructions issued in their support. It is worth mentioning the successive setting-up of the DAFS, the ONEPAFS, the INAFA, and the INA; the translation of the national anthem into some 10 languages in 1985; the fact that civil servants are taught to read and write in national languages; the publication of a circular obliging ministers and senior managers to use the national languages for preference when addressing the people at large; the 'Commando' literacy program and the 'Bantaré' program aimed at making 10 000 women literate; and so on.

All these measures will be given concrete expression by the use of the national languages on television and radio, in written materials of all types, in the courts of first instance, and in religious services.

On television The three most widely used languages are employed daily to broadcast news that has already been broadcast in French, to debate certain problems in magazine programs broadcast in the relevant languages, and to give lessons in transcription through courses organized by the officials of the INA.

On radio Some 20 national languages have access to the radio where they are given generous time allocations. They use these to broadcast news and to organize programs containing folktales, proverbs, and riddles, thus encouraging oral literature.

In written and oral literature Oral literature exists in all the languages. It has its own means of preservation and is not dependent on being written down. Written literature is practically nonexistent, however, being limited to a few INA publications, to essays by some authors in the context in the national Grand Prix for Art and Literature (GPNAL), and to religious writings. Nonetheless, it is worth noting the existence of some newspapers that appear at irregular intervals in four of the country's languages, namely Moore, Jula, Fulfulde, and Gulmancema.

In the courts of first instance In these courts, and especially in local arbitration and reconciliation tribunals, all the national languages are used. However, in the large towns, the three majority languages enjoy a privileged position, with the other languages being mainly employed in the villages.

In religious services This area is where the national languages are used the most. The Christians teach their congregations to read and write in these languages. In this context, the SIL (Summer Institute of Linguistics) organizes literacy courses.

Conclusion

In Burkina Faso, several so-called national languages live peacefully side by side with the official language, French. Briefly, the use that the typical citizen of the country makes of languages may be described as follows: the official language is used to communicate with the outside world, while the national languages are devoted to internal purposes.

Burma: Language Situation

J Watkins, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

First, a note on alternative names. The names of places, ethnolinguistic groups and their languages may in some cases be rendered in English in two ways: one introduced by the Burmese government in 1989 and one in use before then that may still have general currency. Such pairs are separated with an oblique stroke, the older name preceding the newer one, thus: Burma/Myanmar.

Burma, like the entire Southeast Asian region, is an area of extreme linguistic diversity. Most languages indigenous to the territory of the Union of Myanmar (here referred to simply as Burma) belong to the Tibeto-Burman, Tai-Kadai, and Mon-Khmer language families. The task of enumerating the languages spoken in Burma is confounded by three factors that may cause the number of languages to be overestimated or underestimated.

Firstly, there is a general dearth of accurate and up-to-date demographic data describing the population of Burma and the languages they speak. There has never been a formal linguistic survey of the country, and many of the data available are patchy and unreliable, and the speaker numbers presented here include provisional and rough estimates. Secondly, languages and dialects spoken in Burma may be referred to by multiple names, which may be ethnonyms and/or language names, both autonymic and exonymic. Conversely, one name may be used to refer to multiple languages and dialects. Lastly, the perennial problem of how to define distinct languages as opposed to dialects of the same language is frequently encountered in Burma.

The geographical distribution of Burma's languages is obviously a complex affair. In general, the Burmese-speaking Burman/Bamar majority live in the central plains, occupying about half the area of the country, with other languages found in the more mountainous areas nearer the borders in all directions. These areas coincide mostly with the area of the administrative non-Burman States: Arakan/Rakhine, Chin, Kachin, Shan, Karenni/Kayah, Karen/Kayin, and Mon.

The most comprehensive reliable listings of the languages spoken in Burma are Bradley's map of the country in the *Atlas of the world's languages* (Bradley, 1994) and SIL International's *Ethnologue*. The total number of languages spoken in Burma is put at 107 by SIL International. The population of the country has recently been estimated to be approximately 53 million, some 20% more than the figures used by SIL.

In official Burmese government sources, the number of 'national races' in Burma is put at 135. The ethnic groups in this list are often categorized geographically according to the state in which they reside, with no regard for their linguistic relationships. This tally appears to stem from the 1931 British Census of India, and bears little resemblance to the actual ethnolinguistic situation.

Tibeto-Burman Languages

Tibeto-Burman languages are spoken by about four-fifths of the population of Burma.

Burmese is the Tibeto-Burman language with more speakers than all the rest of the Tibeto-Burman languages combined. It is the first language of about two-thirds of the population and is spoken non-natively by several million speakers of other languages. The dialects Arakanese (Arakan/Rakhine State), Tavoyan (Tenasserim/Tanintharyi Division), and Intha (Shan State) may be argued to be separate languages. Other closely related Burmish languages/dialects include Taungyo, Yaw, Hpun, Achang, Lashi, Maru, and Danu.

Languages of the Loloish branch of Tibeto-Burman are spoken in the eastern part of Shan State, including Lisu (roughly 125 000 speakers), Lahu (approximately 125 000 speakers), and Akha (approximately 200 000 speakers).

The western side of Burma is home to the languages in the diverse Kuki-Chin branch of Tibeto-Burman. In northern Arakan/Rakhine State and in Chin State, some two dozen Chin languages are spoken, typically with thousands or tens of thousands of speakers at most: Southern Chin (including Daai, Khumi, Mro, and Asho), Mro, Central Chin (including Haka/Lai and Lushai/Mizo), and Northern Chin (including Tedim, Falam, and Thado).

The languages of northern Burma's Kachin State include languages for which the classification within Tibeto-Burman is disputed or unclear. The half-dozen Nungish languages include Nung and Rawang; the Sal group (comprising Baric and Luish languages and Jinghpaw, or classified alternatively as Jinghpaw-Konyak-Garo) includes languages such as Jinghpaw, Kado, Khienmungan, Chang, and Tase.

About 20 languages of the Karen branch of Tibeto-Burman are found in the areas of eastern Burma bordering Thailand, in Karen/Kayin and Karenni/Kayah States, spoken by 3–4 million people. The larger

languages include Sgaw and Pwo (Pho) (approximately 1.25 million speakers each), Padaung (Kayah) (roughly 300 000 speakers) and Pa'O (approximately 500 000 speakers). Other Karen languages include Yintale, Yinbaw, Paku, Geko, Geba, and Manu.

Mon-Khmer Languages

Mon-Khmer languages account for only about 7% of the population. The major Mon-Khmer language spoken in Burma is Mon, a literary language with a rich history, spoken by some 800 000 in the Mon State in southeastern Burma. Palaungic languages, a part of the Northern branch of Mon-Khmer, are spoken by scattered communities in Shan State and in northern central Burma. The larger of these include Wa, a diverse group of several dozen dialects including Paraok, En, Son, Va, and Vo. Wa and the closely related language Plang are spoken in Shan State by perhaps 600 000–700 000 people. About half that number speak other Palaungic languages: Palaung (Pale, Shwe, and Rumai), Riang, Loi, Samtao, and related dialects.

Tai-Kadai Languages

Burma's Tai-Kadai languages are spoken in the northeastern part of Shan State, with speakers of Shan found also some areas of Kachin State. Tai-Kadai languages account for about one-tenth of the population. The major Tai languages spoken in Shan State are Shan (approximately 6% of the population, over 3 million speakers) and the smaller Tai languages Khamti, Khün, Lü, and Tai Nüa.

Other Languages

As a result of Burma's colonization by the British, some South-Asian Indo-Aryan languages not indigenous to Burma – principally Hindi/Urdu, Bengali, and Panjabi – are spoken, mainly in urban centers. They are the descendants of people brought to Burma as part of the colonial administration established by the British. Chinese is spoken both natively and used as a major lingua franca in areas near the Chinese border, in particular the Kokang area.

In Arakan/Rakhine State, a variety of the Chittagonian dialect of Bengali is spoken by the Muslim Rohingya population, numbering in the hundreds of thousands. The Rohingya's status as Burmese nationals has been problematic; in recent years refugees from Burma have fled to Bangladesh, from where a number have been repatriated to Burma. There are a few thousand speakers of Hmong Njua, a Hmong-Mien language, in the northeast of the country.

Burmese is the official and national language. It is the sole language of all the official business and administration of the military government, including all broadcast media and state education, though there is a state-run University for the Development of National Races, established in 1990, with the aim of training teachers in Kachin, Karenni/Kayah, Sgaw and Po Karen/Kayin, Shan, Mon, Arakanese/Rakhine, and Kachin (possibly meaning Jinghpaw), and Chin (possibly meaning Haka/Lai Chin).

Other languages may be taught as part of political movements associated with a particular ethnic group, for example the Mon-language education system promoted by the New Mon State Party in the 1990s.

The use of English in Burma has been a contentious issue over the last century, when at times Burmese took second place in the education system developed under British Colonial Rule. The status of Burmese was reasserted in the 1930s in connection with nationalist anticolonialist political movements such as the *Dobama a-Si a-Youn*. The status of English was drastically reduced under all-Burmese education policies of the U Ne Win socialist government established in 1962, though the teaching of English has resumed and flourished in the last two decades.

At present, private schools, typically the reserve of relatively wealthy city-dwellers, may provide part of their curriculum in English or in Chinese. Such schools may be a popular choice for parents who want to equip their children for commercial success in the future.

While Burmese remains the language of communication at the national level, a number of languages function as regional lingua francas, such as Arakanese in Arakan/Rakhine State and southern Chin State. Shan, Chinese, and Lahu are all used between speakers of other languages in various parts of Shan State.

It is relatively rare for ethnic Burmans/Bamar to speak languages other than Burmese, but most people whose first language is a language other than Burmese speak Burmese to some degree, and frequently other languages besides. A simple straw poll revealed that a quarter of a group of about 25 speakers of the Mon-Khmer language Wa in Shan State spoke five or more languages in their everyday lives.

Pāli, no longer a living language, remains culturally prominent in Burma as the language of the Buddhist scriptures, which are routinely studied and chanted as part of Buddhist religious practice. Pāli is also an important source of loanwords – typically learned and religious vocabulary – in the written languages with predominantly Buddhist speaker populations, namely Burmese, Mon, and Shan.

Languages spoken in Burma have also borrowed vocabulary from English and from the major languages spoken in the countries neighboring Burma: Chinese, Thai, Bengali, and Hindi.

Of course, many of the languages spoken in areas near Burma's borders with neighboring countries are spoken on both sides of the border by speech communities that may have a common sense of identity despite the political divisions imposed by the border. Examples of such communities are Wa in Burma and China, Karen/Kayin in Burma and Thailand, and Naga in Burma and India.

The general lack of research on Burma's linguistic landscape means that there is an incomplete picture of the extent and scope of language endangerment in Burma. Undoubtedly, certain languages may be losing ground to Burmese or regional languages, or may be losing internal dialectal diversity.

There is a critical need for a systematic language survey of Burma.

Introduction

Burmese is the national language of Burma/Myanmar and is the mother tongue of the Burman (Bamar) ethnic majority, who make up approximately two-thirds of Burma's population of slightly over 50 million. The rest of the country's indigenous population is diverse, speaking between 60 and 100 other languages among them, depending on the criteria used to distinguish languages from one another. Most non-Burmans live in the areas near Burma's borders with Thailand, Laos, China, India, and Bangladesh, although many live interspersed with Burmans and speak Burmese and other languages in addition to their native language. Burmese is little spoken outside Burma, but widely dispersed and fragmented communities of Burmese expatriates may be found in Asia and around the world.

Burmese belongs to the Tibeto-Burman language family, which comprises approximately 350 languages spoken across a vast territory stretching from the Himalayas to mainland Southeast Asia. Burmese has by far the largest number of speakers of any of the Tibeto-Burman languages, most of which have only a few thousand speakers and many of which may disappear during the 21st century.

Most of the other languages spoken in Burma also belong to the Tibeto-Burman language family. Some, such as Arakanese (Rakhine), Intha, and Danu, are so similar to Burmese as to be considered by some to be dialects of Burmese rather than separate languages.

History and Script

The Burmese have been in the area of modern Burma/Myanmar from approximately 850 C.E. onward, founding their capital at Pagan (Bagan). Despite extensive contact over the following two centuries with the Pyu, the speakers of a now-dead Tibeto-Burman language that occupied the area, the first inscriptions in Burmese date from the 11th century, with no extant examples of Burmese writing before then. Burmese script is a close cousin of the Mon script, which was adapted from a southern Indian script, a descendant of the Brāhmī script that was the ancestor of many Indic scripts found in South and Southeast Asia. It is thought that the Burmese adapted the script from Mon after Mon scribes were brought to the city of Pagan after the Burmese king Anawratha, in 1057 C.E., defeated the Mon, although this theory has been disputed in recent research.

Aside from the rounding of the originally square characters into the distinctive round-shaped letters of Burmese today, the alphabet has remained largely unchanged to the present day. It is widely believed that the round shapes of Burmese letters evolved because texts were traditionally written on palm leaves, which would split easily if angled shapes were scratched on them. Whether or not this is true, Burmese writing retains its distinctive round shapes, and handwriting with consistent, even circles is praised.

The writing system evolved between the period of the early inscriptions and the 16th century C.E. when it assumed a form similar to its present-day state. The spoken language has changed considerably since that time, with the result that a faithful transliteration of written Burmese (such as the one approved by the American Library Association and the Library of Congress used here) gives little impression of the way letters or words are pronounced in the language today. Sound changes have applied to certain initial consonants. Final consonants have disappeared. A glottal stop is all that remains of final stop consonants, whereas the place contrasts of written final stops are realized as vowel changes in the syllable. Final nasal consonants have been replaced by a parallel series of nasalized vowels. In general, many combinations of symbols are pronounced differently from the sounds represented by the symbols individually.

The phonetic transcription used here is faithful to the principles of the IPA, although several others have been devised. A transliteration and transcription are compared in the following example.

Burmese script	ရုပ်မြင်သံကြား
Transliteration	RUP'MRAṄ'SAṀKRĀ
Transcription	jouʔ.mjìɴ.θàɴ.ʤá
Gloss	picture.see.sound.hear
Translation	'television' (more commonly တီဗီ tì.vì 'T.V.')

Burmese script is basically alphabetic. There are separate symbols to represent consonants (Table 1) and vowels (Table 2), but the symbols are organized in syllabic clusters, which are written from left to right. Within each cluster, however, the symbols do not necessarily appear in left-to-right order. For example, to write the syllable တီ *tì* 'worm,' the vowel ◌ိ *-ì* is placed on top of the consonant တ *t*, but to write တူ *tù* 'nephew,' the ◌ု *ù* must hang below the initial တ *t*. Certain sounds in Burmese, namely affricates, voiceless sonorants, and initial consonant clusters, are written using medial forms of four consonants, shown in Table 3.

Table 1 Consonants of Burmese, transliterated and transcribed

Burmese script					*Tranliteration*					*Transcription*				
က	ခ	ဂ	ဃ	င	K	KH	G	GH	Ṅ	k	k^h	g	g	ŋ
စ	ဆ	ဇ	ဈ	ဉ/ည	C	CH	J	JH	Ñ /ÑÑ	ʨ	$ʨ^h$	ʥ	ʥ	ɲ
ဋ	ဌ	ဍ	ဎ	ဏ	Ṭ	ṬH	Ḍ	ḌH	Ṇ	t	t^h	d	d	n
တ	ထ	ဒ	ဓ	နဉ်	T	TH	D	DH	N	t	t^h	d	d	n
ပ	ဖ	ဗ	ဘ	မ	P	PH	B	BH	M	p	p^h	b	b	m
ယ	ရ	လ	ဝ	သ	Y	R	L	V	S	j	r	l	w	θ
	ဟ	ဠ	အ			H	Ḷ	-			h	l	ʔ	

Table 2 Burmese word-initial and word-internal vowel symbols

Word-initial		*Word-internal*		*Transliteration*	
အ	အာ	◌	◌ာ	A	Ā
အိ	ဣ	◌ိ	◌ီ	I	Ī
အု	ဥ	◌ု	◌ူ	U	Ū
အေ	ဩ	◌ေ	◌ော	E	O

Burmese script has retained the features and symbols needed for writing the South Asian languages for which its parent scripts were originally designed, such as Pāli, the language of the Buddhist scriptures and the source of many loans in Burmese, which can easily be identified because of phonological features such as doubled consonants and retroflex consonants that do not occur in Burmese words. A Pāli phrase and its rendition in Burmese are shown next.

Burmese script	ဗုဒ္ဓံသရဏံဂစ္ဆामိ
Transliteration	BUDDHAṀ SARANAṀ GACCHĀMI
Transcription	bouʔdàɴ θəɹənàɴ gjiʔs^{h}àmḭ
	'I go to the Buddha for refuge'

Phonetics and Phonology

Some of the sounds used in Burmese are considered unusual because they occur relatively rarely in the world's languages. These are the so-called voiceless nasals, which include the sound of air escaping through the nose. The Burmese word for ရင်းနှီးမြှုပ်နှံမှု jíɴ.n̥ì. m̥jouʔ.n̥àɴ.m̥ũ 'investment' contains examples of two such sounds: /m̥/ and /n̥/. The consonants in Burmese are set out in Table 4.

For reasons of historical phonology, vowels in orthographically open syllables (Table 5), which are written with no final consonant letter, can be distinguished from those found in orthographically closed syllables (Table 6) namely those ending in a glottal stop or with a nasal vowel (transcribed here with /ɴ/, which does not represent a final nasal consonant), both of which are written as final consonant letters in the writing system.

Like the majority of the languages spoken in mainland East and Southeast Asia, Burmese is a tone language. The tonal contrasts involve not only the commonly observed differences in pitch and vowel length but also differences in phonation type – whether the voice is breathy or sharp in character. The presence or absence of a glottal stop at the end of the syllable may also considered to be part of the tonal system. Table 7 gives a basic description of the tonal contrasts on a syllable consisting of a bilabial nasal and an open vowel.

Table 3 Medial forms of Burmese consonants

Initial	*Medial*	*Burmese*	*Transcription*	*Pronunciation*	*Gloss*
ယ	ျ	များ	MYĀ"	mjá	'many'
		ကျား	KYĀ"	tɕá	'tiger'
ရ	ြ	မြန်မာ	MRAN'MĀ"	mjàɴmà	'Burma/Myanmar'
		ခြောက်	KHROK'	tɕʰ auʔ	'dry'
ဝ	ွ	လွယ်	LVAY'	lwɛ̀	'easy'
		နွား	NVĀ"	nwá	'cow'
ဟ	ှ	မှာ	MHĀ"	m̥à	'order'
		ရှုံ့	RVHAṀ'	ʃṵɴ	'mud'
Words may be spelled with a maximum of three medial consonants:					
		အမြှာ	AMRVHĀ	ʔəm̥wà	'segment'

Table 4 The consonants of Burmese

	Bilabial	*Dental*	*Alveolar*	*Postalveloar*	*Palatal*	*Velar*	*Glottal*
Stop	p pʰ b		t tʰ d	tɕ tɕʰ dʑ		k kʰ g	ʔ
Nasal	m m̥		n n̥		ɲ ɲ̥	ŋ ŋ̥	
Fricative		θ ð	s sʰ z	ʃ			h
Approximant	w ʍ		(ɹ)		j		
Lateral			l ɬ				

Burmese morphemes in phrases and compounds display varying degrees of phonological juncture, principally voicing assimilation and reduction of the first syllable, as shown in the following examples.

- Voicing assimilation on internal morpheme boundaries in compounds.

ပန်း + ခြံ > ပန်းခြံ	pán + tɕʰàɴ > pándʑàɴ	'flower' + 'enclosure' > 'garden'
စား + ပွဲ > စားပွဲ	sá + pwɛ́ > sábwɛ́	'eat' + 'event' > 'feast'
မြင် + တယ် > မြင်တယ်	mjìɴ + tɛ̀ > mjìɴdɛ̀	'see' + REALIS > 'sees/saw'

- Reduction of first element in compounds.

ခါ + ပိုက် > ခါးပိုက်	kʰá + paiʔ > gəbaiʔ	waist + carry > 'pocket'
စား + ပွဲ > စားပွဲ	sá + pwɛ́ > zəbwɛ́	eat + event > 'table'

Table 5 Vowels of Burmese in orthographically open syllables

Vowel	*Lowe tone*		*High tone*		*Creaky tone*	
/i/	ဣ	ì	ဣ။	í	ဣ	ḭ
/e/	ေ–	è	ေ–။	é	ေ–	ḛ
/ɛ/	–ယ်	ɛ̀	––ိ	ɛ́	––ိ	ɛ̰
/a/	–ာ	á	–ာ။	á	–	a̰
/ɔ/	ေ–ာ်	ɔ̀	ေ–ာ	ɔ́	ေ–ာ့	ɔ̰
/o/	–ို	ò	–ို။	ó	–ို့	o̰
/u/	–ု	ù	–ု။	ú	–ု	ṵ

Morphology

Morphemes in Burmese are predominantly monosyllabic. With the exception of Indo-European loans, typically from Pali or English, compounding is the major source of polymorphemic words. In the television example above, four morphemes (N + V) (N + V) combine to form a noun.

Derivational morphology by prefixation is common, in particular noun-formation from verbs using the prefix အ-ʔə-.

ပြိုင်ဆိုင် > အပြိုင်အဆိုင်	pjàɪnsʰàɪn > ʔəpjàɪn ʔəsʰàɪn	compete > competition
ရောင်း / ဝယ် > အရောင်းအဝယ်	jáʊn / wɛ̀ > ʔəjáʊn ʔəwɛ̀	sell / buy > trade

The verbal complex, typcially occurring at the end of a Burmese sentence, may comprise one or more head verbs in series followed by a string of auxiliary verbs, verbal particles, and markers.

NP	NP	VP
ခေတ်မီဈေးတွေ	ဟိုတယ်တွေ	ဖြစ်ပေါ်လာစေပြန်ပါတယ်။
kʰiʔm̰ì. zé.dwè	hòtɛ̀.dwè	pʰjiʔ.pɔ̀. là. zè.bjàɪn.bà.dɛ̀

Table 6 Vowels of Burmese in orthographically closed syllables: killed tone or nasal vowel

Vowel	*Nasal vowel*						*Killed tone*	
	Low tone		*High tone*		*Creaky tone*			
/i/	–င်	ìɪn	–င်။	ínɪn	–င့်	ḭɪn	–စ်	iʔ
/e/	–ိန်	èɪn	–ိန်။	éɪn	–ိန့်	ḛɪn	–တ်	eiʔ
/ɛ/							–က်	ɛʔ
/ai/	–ိုင်	àɪn	–ိုင်။	áɪn	–ိုင့်	a̰ɪn	–ိုက်	aiʔ
/a/	–ိ	àn	–နှ်။	án	–နှ့်	a̰n	–တ်	aʔ
/au/	ေ–ာင်	àʊn	ေ–ာင်။	áʊn	ေ–ာင့်	a̰ʊn	ေ–ာက်	auʔ
/ou/	–ုန်	òʊn	–ုန်။	óʊn	–ုန့်	o̰ʊn	–ုတ်	ouʔ
/u/	–ုန်	ùn	–ုန်။	ún	–ုန့်	ḭn	–ုတ်	uʔ

Table 7 Burmese tones

Tone name	*IPA*	*Burmese script*	*Description*
Low	[mɑː]	မာ	long, low
High	[mɑ́ː]	မား	long, high; sometimes breathy
Creaky	[mɑ̰]	မ / မာ့	short, high, with creaky phonation
Killed	[mɑ̰ʔ]	မတ်	short, high, with final glottal stop

[a]Syllables with one of these tones may in some contexts become reduced to a short, unstressed schwa which is counted as a fifth tonal category in some analyses.

modern.market.PL hotel.PL become emerge.begin.
CAUS.also.
POLITE.REALIS
'. . . caused modern markets and hotels to begin to appear as well'

Burmese has a system of noun case markers, which in many contexts are not obligatorily present, and postpositions, as illustrated next.

ဦးဘက	မန္တလေးကို	အမေနဲ့	သွားတယ်။
ʔú.ba˺.ga˺	mə́ndəlé.gò	ʔəmè.nɛ̰	θwá.dɛ̀
U Ba.SUBJ	Mandalay.to	mother.with	go.REALIS

Burmese, like other languages of the region, encodes power and solidarity in personal relationships using a rich system of pronouns and forms of address. Pronouns may be true pronouns, such as ငါ ŋà 1SING 'I' and နင် nìN 2SING 'you' (both familiar, not polite), or grammaticalized from other sources, such as ကျွန်တော် tɕɔnɔ̀ 1SING (male, polite; literally 'royal slave'). Other forms of address include titles, personal relationships, and names or a combination of all three, such as ဆရာမဒေါ်ခင်ခင်ချော sʰəjáma˺. dɔ̀.kʰì nkʰìntɕʰɔ́ 'Teacher (FEM) Aunt (= Mrs.) Khin Khin Chaw.'

Literacy and Literary Burmese

The literacy rate in Burma has often been said to be high compared to other countries in the region, but accurate data are extremely difficult to obtain. One recent source suggests that nearly 80% of Burmese people over the age of 15 are literate, but other sources have put the figure much lower.

The Burmese language exists in a colloquial style used in spoken informal contexts and a literary style used in official formal settings. The main difference between the two is that they have separate sets of grammar words and some other vocabulary. A colloquial-style sentence is compared to its literary-style equivalent in the next example.

Spoken	ဦးဘက	မန္တလေးကို	အမေနဲ့	လာတယ်။
	ʔú.ba˺.ga˺	mə́ndəlé.gò	ʔəmè.nɛ̰	là.dɛ̀
Literary	ဦးဘသည်	မန္တလေးသို့	အမေနှင့်	လာ၏။
	ʔú.ba˺.ðì	mə́ndəlé.ðo̰	ʔəmè.n̥ḭN	là.ʔḭ
	U Ba.SUBJ	Mandalay.to	mother.with	come.
				REALIS

'U Ba came to Mandalay with his mother'

Given the large number of speakers of Burmese and the existence of a large diaspora community scattered around the world, Burmese has an inevitable presence on the Web, although at the time of writing standardized encoding has yet to be widely adopted and so text is usually displayed on the Internet as graphics. For ease of use, computer users often render Burmese in romanized form in Internet chat rooms or e-mail.

Burnett, James, Monboddo, Lord (1714–1799)

P C Sutcliffe, Colgate University, Hamilton, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

James Burnett, born in Monboddo in Scotland on October 14, 1714, was a judge, classics scholar, and a Scottish Enlightenment philosopher. After a classical education, Burnett studied law and eventually became a judge, Lord of Session, taking the title Lord Monboddo, in 1767 and remained in this post until his death on May 26, 1799. An eccentric and controversial figure, Monboddo was not afraid to expound unpopular views, both on the bench and in his scholarship, especially as a member of the Select Society of Edinburgh, a group of prominent citizens that gathered weekly to share ideas that included David Hume and Adam Smith (*see* **Smith, Adam (1723–1790)**) among others. In his two anonymously published six-volume works, *Of the progress and origin of language* (OPL) (1773–1792) and *Antient metaphysics* (AM) (1779–1792), he opposed Locke's popular empiricism, favoring the idealist metaphysics and authority of the ancient Greeks, especially Aristotle.

Of the two works, OPL deals more specifically with language and was the more popular and successful, though the basic arguments are reiterated in Book III of AM. The first two volumes of OPL are most frequently discussed. In Monboddo's own words, the "three heads" of Book I were "that Language is not natural to man . . . that it may have been invented . . . and . . . to show how it was invented" (Cloyd, 1972: 45). Though all humans have a faculty for language founded upon their ability to abstract meaning, language only arose where humans lived communally, gradually evolving from animal cries as men purposefully attached meaning to sounds. That the natural, primitive state of man is without language, Monboddo revealed in credulous accounts of travelers' tales of primitive societies and by maintaining that orangutans, because of their social behavior, were actually the lowest form of humans without language. This notorious claim discredited Monboddo's work to many of his contemporaries as well as to posterity, even as it classified him as a pre-Darwinian. Book II is a universal grammar, influenced by the work of Monboddo's friend, Harris (*see* **Harris, James (1709–1780)**).

Burnett, James, Monboddo, Lord (1714–1799)

P C Sutcliffe, Colgate University, Hamilton, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

James Burnett, born in Monboddo in Scotland on October 14, 1714, was a judge, classics scholar, and a Scottish Enlightenment philosopher. After a classical education, Burnett studied law and eventually became a judge, Lord of Session, taking the title Lord Monboddo, in 1767 and remained in this post until his death on May 26, 1799. An eccentric and controversial figure, Monboddo was not afraid to expound unpopular views, both on the bench and in his scholarship, especially as a member of the Select Society of Edinburgh, a group of prominent citizens that gathered weekly to share ideas that included David Hume and Adam Smith (*see* **Smith, Adam (1723–1790)**) among others. In his two anonymously published six-volume works, *Of the progress and origin of language* (OPL) (1773–1792) and *Antient metaphysics* (AM) (1779–1792), he opposed Locke's popular empiricism, favoring the idealist metaphysics and authority of the ancient Greeks, especially Aristotle.

Of the two works, OPL deals more specifically with language and was the more popular and successful, though the basic arguments are reiterated in Book III of AM. The first two volumes of OPL are most frequently discussed. In Monboddo's own words, the "three heads" of Book I were "that Language is not natural to man . . . that it may have been invented . . . and . . . to show how it was invented" (Cloyd, 1972: 45). Though all humans have a faculty for language founded upon their ability to abstract meaning, language only arose where humans lived communally, gradually evolving from animal cries as men purposefully attached meaning to sounds. That the natural, primitive state of man is without language, Monboddo revealed in credulous accounts of travelers' tales of primitive societies and by maintaining that orangutans, because of their social behavior, were actually the lowest form of humans without language. This notorious claim discredited Monboddo's work to many of his contemporaries as well as to posterity, even as it classified him as a pre-Darwinian. Book II is a universal grammar, influenced by the work of Monboddo's friend, Harris (*see* **Harris, James (1709–1780)**).

In 1784, parts of the first three volumes of OPL were translated into German and published with a foreword by Herder (*see* **Herder, Johann Gottfried (1744–1803)**), who praised Monboddo for his first attempts to use a comparison of languages and races to develop a philosophy of mankind. OPL influenced Herder's *Ideen zur Philosophie der Geschichte der Menschheit*. Monboddo can also be linked to Jones (*see* **Jones, William, Sir (1746–1794)**), with whom he corresponded. Monboddo postulated a connection between Greek and Sanskrit in Book I of OPL in 1774, and this, perhaps, deserves to be considered the starting point of comparative linguistics rather than Jones's statement of 1786. Certainly, Monboddo's tremendous influence on his contemporaries makes him worthy of more consideration than he has traditionally received.

Burrow, Thomas (1909–1986)

R Chatterjee, Lado International College, Silver Spring, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Thomas Burrow was born on June 29, 1909 in the Lancashire village of Leck. He studied classics at Cambridge University. He became interested in Sanskrit through a course in comparative philology and received his Ph.D. for his studies on the Kharosthi documents from Chinese Turkestan (now Xinjiang, land of the Uighur people). In 1944 he was appointed to the Boden Chair in Sanskrit at Oxford. He retired in 1976 and died 10 years later.

Burrow's first book on the Kharosthi documents analyzes them as related to a Prakrit of Northwest India, now in the Peshawar region. He provides a grammar of the language and a combined index and vocabulary. Burrow's work in Sanskrit itself is well represented by *The Sanskrit language* (1955, 1966, 1973). Burrow's focus here is the description of Sanskrit in its relation to Indo-European. He masterfully lays out the Indo-European neighbors of the language and their overlapping characteristics, quoting at the beginning the famous words of Sir William Jones in his address to the Royal Asiatic Society of Bengal in 1786: "The Sanscrit language, whatever be its antiquity, is of wonderful structure; more perfect than the Greek, more copious than the Latin, and more exquisitely refined than either . . .". Burrow writes of Sanskrit as "a form of language which in most respects is more archaic and less altered from original Indo-European than any other member of the family." He emphasizes that the importance of Sanskrit grammarians is unequalled anywhere in the world, and that Panini's work regulated the language of the classical literature in the language "to the last detail."

In the 1960s, Burrow, with Murray B. Emeneau, made a signal contribution to the study of the other great language family of India, Dravidian. Their *Dravidian etymological dictionary* (DED) first appeared in 1961. It has been called a landmark event in Dravidian linguistics. Data from almost 30 languages are taken into account. The dictionary itself runs to some 500 pages. There are indexes of Dravidian, Indo-Aryan, Munda and other languages, including Hobson-Jobson. There is also an index of English meanings and of flora. The dictionary does not contain proto-Dravidian reconstructions – Burrow and Emeneau decided that the time required was not warranted by the state of Dravidian studies at the time.

When the DED was published, the compilers decided to restrict it to Dravidian material alone. However, Indo-Aryan material had been collected and was readied for publication in the University of California Publications in Linguistics in 1962 under the title *Dravidian borrowings from Indo-Aryan*.

In 1968 Burrow published a collection of papers in India, *Collected papers on Dravidian linguistics*. Notable here is an excursus into the further relationships of Dravidian languages to geographically distant families such as Ural-Altaic, specifically

In 1784, parts of the first three volumes of OPL were translated into German and published with a foreword by Herder (*see* **Herder, Johann Gottfried (1744–1803)**), who praised Monboddo for his first attempts to use a comparison of languages and races to develop a philosophy of mankind. OPL influenced Herder's *Ideen zur Philosophie der Geschichte der Menschheit*. Monboddo can also be linked to Jones (*see* **Jones, William, Sir (1746–1794)**), with whom he corresponded. Monboddo postulated a connection between Greek and Sanskrit in Book I of OPL in 1774, and this, perhaps, deserves to be considered the starting point of comparative linguistics rather than Jones's statement of 1786. Certainly, Monboddo's tremendous influence on his contemporaries makes him worthy of more consideration than he has traditionally received.

Burundi lies surrounded by the Democratic Republic of the Congo in the east, Rwanda in the north, and Tanzania in the east. In the southwest, Burundi borders Lake Tanganyika. The comparatively small country has about 6.2 million inhabitants divided into three main ethnic groups: Hutus (approx. 85%), Tutsis (approx. 14%), and Twa (1%). The Twa pygmies are an original hunter-gatherer community and are now mainly engaged in hunting, pottery, and ironworking. They are assumed to be the original inhabitants of the area, with Hutus and Tutsis arriving later. The Urundi kingdom became part of German East Africa in 1890, together with the neighboring Rwanda. After World War I both territories were administered by Belgium under a League of Nations mandate. In 1962 Burundi became an independent kingdom, and in 1966, after the overthrow of the monarchy, a republic. Burundi has a long history of suffering from internal unrest and ethnic violence brought about by conflicts between Hutus and Tutsis. Ironically, the country is a counter-example to the claim that monolingualism brings internal stability, as all ethnic groups in Burundi speak one language, Rundi.

Rundi (Kirundi) is a Bantu language closely related to Kinyarwanda, the language of Rwanda, as well as to Ha of Tanzania. All three are largely mutually intelligible, although the varieties are distinct enough to serve for ethnic and national identification. Within Burundi, Hutus, Tutsis, and Twas speak different dialects of Rundi. The last two groups are assumed to be originally speakers of non-Bantu languages, and to have shifted to Rundi. Communities of Rundi speakers, including refugees, are also found in Rwanda, Uganda, and Tanzania. In addition to Rundi, the former colonial language, French, is used in Burundi, especially for formal and official purposes, in education, and for international communication. Both Rundi and French are official languages. The third important language in Burundi is Swahili, which is spoken by the Muslim, Asian, and Congolese communities, as well as a contact language by others, mainly in the capital, Bujumbura, and along Lake Tanganyika.

Burushaski

G D S Anderson, Salem, OR, USA

© 2006 Elsevier Ltd. All rights reserved.

Burushaski is a language isolate spoken in the Northern Areas, Pakistan, primarily in the Hunza, Nagar, and, Yasin valleys. A small enclave of Burushaski speakers is also found over the border in Kashmir, India. The Hunza and Nagar varieties differ only minorly from each other; both stand at a relative distance from the Yasin variety of Burushaski, sometimes also considered to be a close sister language, Werchikwar.

There are approximately 80 000 speakers of Burushaski, including somewhere in the area of 15 000–20 000 people speaking the Yasin dialect, with an additional 20 000–30 000 speakers of both Hunza Burushaski and Nagar Burushaski. In all communities where Burushaski is spoken, the language remains vital, with many women and children still monolingual speakers.

The first comprehensive study of Burushaski was Lorimer (1935–1938). The most recent is Berger's three-volume grammar, dictionary, and text collection (1998).

Bilingualism among Burushaski speakers is common primarily in the two Dardic Indo–European languages Shina (Nagar Burushaski speakers) and Khowar (the Burusho of Yasin valley). In Hunza, especially in the village of Mominabad, the Indo–Aryan-speaking Dúumaki (Domaaki) live in close contact with Burushaski speakers; nearly all Dúumaki speakers appear to be bilingual in Burushaski. Burushaski itself may have previously been spoken in a wider area than it is currently found: for example, in Dras, in Baltistan, there is a group of people known as the Brokpa or Brusa; also, in Ponjal, there are the so-called Burushken, who are now Shina speaking.

Burushaski has a basic five-vowel system, with two series of contrastive long vowels, alternatively bearing stress or higher pitch on the first or second mora, respectively:

(1)	i	íi	íí			u	úu	uú
	e	ée	eé			o	óo	oó
				a	áa	aá		

There is some dispute among Burushaski specialists as to the exact nature of these long vowels. Varma (1941: 133) described the suprasegmental or intonational contrasts of Burushaski long vowels as representing a rising and falling tone; modern investigators, however, e.g., Tiffou (1993), Berger (1998), and Morin and Tiffou (1989), considered this to be a difference of moraic stress: that is, Burushaski long vowels may receive stress on either the first mora or the second, corresponding to Varma's falling and rising tones, respectively. These phenomena are phonemic in Burushaski. A comprehensive instrumental analysis of Burushaski vocalism remains to be done. A lowered pitch on the first mora is sometimes heard with the former (initial-mora prominent) forms. (Note that expressive diminutives are generally associated with this intonational pattern, e.g., *šon* 'blind' vs. *šóon* 'somewhat blind' or *ṭak* 'attached' vs. *ṭáak* 'somewhat attached.') Yasin exhibits the same intonational phenomena as the standard Hunza and Nagar varieties, although the moraic stress difference seems to be less pronounced, and in some speakers, this contrast has been neutralized.

Examples of phonemic vowel contrasts in Burushaski include *bat* 'flat stone' vs. *baát* 'porridge' (as in *bras-e baát* 'cooked rice,' *aalu-e baát* 'mashed potatoes'); *ḍir* 'boundary, water ditch between fields, small irrigation canal; hostility' vs. *ḍíir* 'overhanging rock'; *ɣun* 'wooden block in door lock, stocks (for prisoner)' vs. *ɣúun* 'quail'; *men* 'who' vs. *meén* 'old, venerable; fallow field'; *gon* 'dawn' vs. *goón* 'like, as.' Note that these length contrasts only appear in stressed syllables in Burushaski.

Three-way contrasts between short, first-mora-prominent, and second-mora-prominent vowels are found in a small number of lexical items in Burushaski. Such triplets include *bo* 'grain, seed, sperm/semen' vs. *bóo et-* 'low, bellow' vs. *boó* (cf. *nupáu* ~ *nupoón* in the converb form) 'sit down, lower self,' *don* 'large herd' vs. *dóon* (~*dóon ke*) 'still, yet, nevertheless' vs. *doón* 'woman's head scarf; open' (Berger, 1998: vol. 3, pp. 121–122). Two-way length contrasts, such as *báak* 'punishment, torture' vs. *baák* 'generosity' are relatively common.

Burushaski has an extensive system of consonants. In fact, there are eight different stop/affricate series attested in the language. This includes labial, dental, alveolar, retroflex, palatal, palatal-retroflex, velar, and uvular. All of these series may be found in voiceless unaspirated, voiceless aspirated, and voiced series (see Table 1).

Table 1 The consonantal inventory of Burushaski

p	t	c	ṭ	č	c̣	k	q	
p^h	t^h	c^h	$ṭ^h$	$č^h$	$c̣^h$	k^h	q^h	
b	d	z	ḍ	ǰ	ǰ̣	g	ɣ	
(f)[a]		s		š	ṣ	(x)[a]		h
m	n					ŋ		
w				y	y̧			
	l	r						

[a][f] and [x] occur only in loan words, or as a variant of the aspirated stops [pʰ] and [qʰ] or [kʰ], respectively.

Table 2 Plural formation in Burushaski

Singular	*Plural*	
hal	*hal-ǰó*	'fox'
ǰiip	*ǰiip-uc*	'jeep'
ɣus	*ɣuš-oŋo*	'earthen clump'
čonč	*čonč-iŋ*	'summit, peak'
-ɣarum	*ɣarum-iŋ* ~ *ɣarim-iŋ*	'part'
gírkis	*girkič-o*	'rat'
ɣurkun	*ɣurkuy-o*	'frog'
ɣurkuc	*ɣurkuč-o*	'frog' (Nagar)
ašaáto	*ašaátu-tiŋ*	'weak(ling)'
ɣat-enč̣	*ɣat-aŋ*	'sword'

While retroflexion is common throughout the languages of south Asia, Burushaski has one of the largest inventories of nonsonorant retroflex sounds among the languages of the region, with no fewer than seven such sounds. In addition, the Hunza and Nagar varieties possess a curious retroflex, a spirantized palatal, symbolized /ɣ̱/, with a range of local or idiolectal realizations. This sound is lacking in the Yasin Burushaski dialect.

Burushaski possesses four noun classes, based on real-world semantic categorization. Thus, male humans belong to class I, female humans to class II, nonhuman animates to class III and inanimates to class IV (2). These classes are formally realized not in the noun themselves but through the selection of case allomorphs and verb agreement morphology.

(2) I: male human — II: female human
hir 'man' — *dasín* 'girl'
III: animate nonhuman — IV: inanimate
haɣúr 'horse' — *ɣaténč̣* 'sword'

Another salient feature of the nominal system of Burushaski is the wide range of plural formations attested in the language. There are literally dozens of plural markers in the language, each often found with only a small number of nouns. Sometimes these are found only with nouns of a particular class but others crosscut this categorization (see Table 2).

Burushaski has a highly developed system of grammatical and instrumental cases as well as an elaborate system of local/directional cases and instrumental/comitative cases (see Table 3). The exact number is difficult to determine as new elements enter this system through the grammaticalization (and phonological fusion) of relational nouns/postpositions. There are at least the following grammatical cases (i.e., ones assigned by structural position or verbal subcategorization): ergative, genitive, dative, ablative. In the latter two instances with class II nouns, the cases are built off the genitive (or oblique) stem.

Numerals agree in class with their nominal complement in class in Burushaski (note class-I and class-III are conflated here; see Table 4). Numbers 20 and above are based on a clear vigesimal system, 30 literally being '20–10' and 40 being (etymologically) '2–20.' etc.

(3) *aalter(an)* 20 — *aalter toorumo* 30
aaltuwalter 40 — *aaltuwalter toorumo* 50
iiski aalter 60 — *iiski aalter toorumo* 70
waalti aalter(an) 80 — *waalti aalter toorumo* 90 — *t^{h}a* 100

The verbal system of Burushaski stands out for its morphological complexity among south Asian languages. There are two basic sets of inflections, depending in part on the stem allomorph. These two broad categories are as follows:

(4)

I	II
past	future
perfect	present
pluperfect	imperfect
aorist (conative)	

The maximal template of the Burushaski simplex verb is given by Tikkanen (1995: 91) as:

(5)

NEG-	D-	PERSON/CLASS/NUMBER-	CAUS-	√-
–4	–3	–2	–1	Ø
	PL.SUBJ-	DUR-	1SG.SUBJ-	
	+1	+2	+3	

PRTCPL/OPT/COND/AUX-	SUBJ.SFX-	Q
+4	+5	+6

Some examples of verbs reflecting this template are given in (6). Note the curious and morphologically triggered (and phonologically unmotivated) devoicing of obstruents following the negative allomorph *a-* (but not *oó-*).

(6)

oó-min-im-i	*oó-man-um-an*
NEG-drink-AP-I	NEG.PL-become-AP-PL
'he didn't drink (it)'	'they didn't become'
(Berger, 1998: 106)	(Berger, 1998: 106)
a-túru-m-i	*duróo-m-i*
NEG-work-AP-I	work-AP-I
'he didn't work'	'he worked'
(Berger, 1998: 105)	(Berger, 1998: 105)
a-mí-kač-ič-a-i	*mi-k^{h}áč-iča-i*
NEG–1PL-enclose-DUR-AUX-I	1PL-enclose-DUR-AUX-I
'he doesn't enclose us'	'he encloses us'
(Berger, 1998: 105)	(Berger, 1998: 105)
a-tu-ququ-m-i	*du-q^{h}óqu-m-i*
NEG-D-be.confused-AP-I	D-be.confused-AP-I
'he was not confused'	'he was confused'
(Berger, 1998: 105)	(Berger, 1998: 105)

In addition to subject and direct/indirect objects, the Burushaski verb may also optionally encode an

Table 3 Case forms in Burushaski

	'man' [I]	*'woman' [II]*	*'horse' [III]*	*'sword' [IV]*
Grammatical cases				
NOM/ABS	*hir*	*gus*	*haɣur*	*ɣatenč*

bow-INSTR-SUPERESS	throw			
'shoot with bow'				

animate possessor of a logical argument as an argument morphologically in the verb-word (7).

(7a) *k^{h}ak^{h}áay-umuc* *p^{h}aṣ̌ú* *mée-t-aa*
walnut-PL gobble.up 1PL-AUX-2
'you gobbled up our walnuts' (Berger, 1998: 162)

(7b) *hiles-e* *dasin-mo* *mo-miṣ* *moo-skarc-im-i*
boy-ERG girl-GEN II-finger II-cut-AP-I
'the boy cut off the girl's finger' (Willson, 1990: 5)

Another characteristic feature of the Burushaski verbal system is the grammaticalized use of double argument indexing with intransitive verbs. This single vs. double marking appears within two separate functional subsystems. In the first one, presence vs. absence of double marking implies degree of control of the subject over the action: less control is indexed through double marking (8a). In the second such subsystem, class-IV nouns receive single marking while class-III nouns receive double marking with the same predicate (8b).

(8a) *ɣurc-ím-i*
sink-AP-I
'he dove under' (Berger, 1998: 118)
i-ɣúrc-im-i
I-sink-AP-I
'he drowned' (Berger, 1998: 118)

(8b) *ha* *ɣulú-m-i*
house burn-AP-IV
'the house burned' (Berger, 1998: 118)
hun *i-ɣúl-im-i*
wood III-burn-AP-III
'the wood burned' (Berger, 1998: 118)

Syntactically, Burushaski is a fairly rigid SOV language. In narrative texts, head-tail linkage, a common narrative device among south Asian languages, is frequently found (clauses are linked by rote repetition of the finite verb of a preceding sentence in a nonfinite form in an immediately following sentence). Further, some cases appear only on the leftmost of two (conjunctively or disjunctively) conjoined nouns, while others appear on both. There thus appear to be both phrasal and word-level case forms in Burushaski.

Table 4 Numerals

	I/III	*II*	*IV*
1	*hin*	*han*	*hi(k)*
2	*aaltan*	*aala/aalto*	*aalti/aalto*
3	*iisken*	*usko*	*iiski*
4	*waalto*	*waalto*	*waal(ti)*
5	*cundo*	*cundo*	*cindi*
6	*mišindo*	*mišindo*	*mišin(di)*
7	*talo*	*talo*	*tale*
8	*aaltambo*	*aaltambo*	*aaltam(bi)*
9	*hunčo*	*hunčo*	*hunti*
10	*toorumo*	*toorumo*	*toorimi*
11	*turma hin*	*turma han*	*turma hik*

A further curious aspect of Yasin Burushaski is the highly atypical semantic (plural) agreement seen with **dis**junctively conjoined NPs (Anderson and Eggert, 2001). Most of these features can be seen in the following examples.

(9a) *gus* *ya* *hir-e* *dasen* *a-mu-yeec-en*
woman or man-ERG girl NEG-II-see-PL
'the woman or the man didn't see the girl'
(Anderson *et al.*, 1998)

(9b) *hir* *ya* *guse-e* *dasen* *a-mu-yeec-en*
man or woman-ERG girl NEG-II-see-PL
'the man or the woman didn't see the girl'
(Anderson *et al.*, 1998)

Another characteristic feature of Burushaski syntax is the extensive use of case forms to mark a wide range of subordinate clause functions (Anderson, 2002).

(10) *ma* *ma-ír-áṭe* *ǰe* *taŋ*
y'all 2PL-die-SUPERESS *I* sad
a-máy-a-m
1-become.dur-1-AP
'when you all die I will be sad'
(Berger, 1998: 140)

Burushaski includes loans from a range of local languages including Urdu, Khowar, Shina, and even (perhaps indirectly) from Turkic languages as well. In some instances, loan affixes may be found as well, e.g., *ḍaḍaŋ-ci* 'big-drum drummer' (Berger, 1998: 209). More tenuous lexical connections have been proposed with Northeast Caucasian languages and Paleo–Balkanic Indo–European languages (Casule, 1998).

There is a small body of indigenous literature in Burushaski written in a modified Urdu script. In addition, various texts in transcription have appeared, including Skyhawk *et al.* (1996), Skyhawk (2003), etc.

C

Çabej, Eqrem (1908–1980)

Z Wąsik, Adam Mickiewicz University, Poznań, Poland

© 2006 Elsevier Ltd. All rights reserved.

Eqrem Çabej was born in Gjirokastra (at that time Turkey) on August 6, 1908, and died on August 13, 1980, in Tirana (Albania). He received his elementary education in the place of his birth and then was sent to Austria to attend a high school at Klagenfurt. Subsequently, he went to Graz and Vienna to study comparative Indo-European linguistics and Albanian philology. In 1933, he defended his doctoral dissertation 'Italoalbanische Studien' before the commission of Paul Kretschmer and Norbert Jokl. After graduating from Vienna University, he worked as a teacher of Albanian in secondary schools and other educational institutions, first in Gjirokastra and then in Shkodër. Spending the interwar period in Italy, which occupied Albania, Çabej studied archival documents from the Albanian past preserved there in libraries. After the end of World War II, when a two-year Pedagogical Institute in Gjirokastra had been created in 1946, he was nominated a 'pedagogue' in linguistics and Albanology. In 1947, he became a member of the Institute of Sciences, and in 1957 he was offered a professorial position at Tirana University. For some years he worked in the Institute of Language and Literature, and when the Academy of Sciences was formed, he was elected a member of its presidium. In 1959, Çabej defended a thesis on 'Some aspects of historical phonetics of Albanian in the light of the language of Gjon Buzuku' [*Disa aspektë të fonetikës historike të shqipes në dritën e gjuhës së Gjon Buzukut*], securing him the degree 'candidate of philological sciences'; and, in the same year, he was given the title 'professor' for his theoretical and practical achievements. He had also prepared a dissertation for a doctor's degree devoted to 'Etymological studies in the domain of Albanian' [*Studime etimologjike në fus hë të shqipes*], but, meanwhile, this degree was abolished. Etymology and history of language were the domains in which he worked until the last days of his life, taking part in all professional sessions of national and international character, in Albania and other research centers of the Balkans and of central Europe, and publishing in journals all over the world.

The scientific activity of E. Çabej embraces two phases. In the first phase, 1929–1945, he was a philologist, folklorist, dialectologist, and ethnographer; in the second, 1945–1980, the focus of his interest shifted to linguistics, etymology and historical phonetics, lexicology, and lexicography. Çabej's first step in describing his own native language in terms of comparative linguistics was a dissertation devoted to Italian and Albanian, a copy of which is available in Vienna University. He paid particular attention to the roots and the place of Albanian in the Balkans. His chrestomathy for high school pupils, 'Elements of linguistics and Albanian literature' [*Elemente të gjuhësisë e të literaturës shqipe*] (1936), comprised in addition to literary texts knowledge related to linguistic classifications and the distribution of Albanian dialects. In it he defended his hypothesis concerning the Illyrian ancestry of his native tongue, exploiting the opinions of philosophers such as G. W. Leibniz, J. E. Thunmann, and J. P. Fallmerayer, and linguists such as G. Meyer and F. X. von Miklosic, as well as P. Kretschmer and N. Jokl. His next monograph, 'On the genesis of Albanian literature' [*Për gjenezën e literaturës shqipe*] (1939), is characterized by its etymological explorations of ethnonyms: *Arbën*, *Arbër*, *Arbëresh*, and the first historical periodization of Albanian literature. Between 1935 and 1942, Çabej published several works from linguistics, folkloristics, and mythology, chiefly in *Revue internationale des études balkaniques*, *Knjige o Balkanu*, and *Leipziger Vierteljahresschrift für Südosteuropa*. In the 1940s, he collaborated with *Hrvatska Enciklopedija* (1941) and later prepared 'The linguistic Atlas of Albanian' (1943). Decisive for Çabej's linguistic reorientation was the study of the 'Missal of Gjon Buzuku' (*Meshari i Gjon Buzukut*) from 1555, preserved in the Vatican Library. The results of his studies of this translation of the Catholic missal and his acquaintance with texts of other Albanian authors led him to write both a series of articles from historical morphology and phonetics published in the *Bulletin*

for Social Sciences at Tirana and a critical edition of the work of Gjon Buzuku (1968) with philological elaboration and explanation throwing light on literary traditions of earlier times. On the basis of constatations included in his earlier works he wrote a treatise 'On some basic problems of the ancient history of Albanian' which had been translated into Italian, French, and English. In some other articles published for international organizations Çabej pointed to the role of Albanian in relation to historically cognate and geographically adjacent languages. The results of his historical studies are reflected in two monographs edited as textbooks for students of Albanian language and literature, 'Introduction to the history of Albanian' and 'Historical phonetics of Albanian' (published in one volume in 1970).

The core of numerous publications of the 1960s and 1970s, however, was Çabej's answers to unresolved questions: whether Albanians are descendants of Illyrians and whether they had always lived in the territories they occupy at present. He provided counterarguments to the claims of G. L. Weigand and other researchers regarding the non-autochthon character of Albanians. Çabej's studies on agricultural terminology beginning in antiquity show the sedentary character of the Albanian tribes.

Opus vitae of Çabej are his 'Etymological studies in the domain of Albanian' (*Studime etimologjike në fushë të shqipes*), discussed and interpreted successively in parts between 1969 and 1979. With his historical experience he has contributed decisively to the codification and standardization of the Albanian language while taking part on editorial boards of practically all dictionaries, both monolingual and multilingual, published in Albania after the War as well as in working groups concerned with orthography, including the Congress of 1972.

Caddoan Languages

D Rood, University of Colorado, Boulder, CO, USA

© 2006 Elsevier Ltd. All rights reserved.

Caddoan is a family of North American language consisting of two branches: Caddo, formerly spoken in Texas and Louisiana, and now spoken only in Oklahoma; and North Caddoan, found in the central Plains from Oklahoma to North Dakota. The North Caddoan languages include Arikara, Pawnee, Kitsai, and Wichita. Arikara and Pawnee are linguistically very close, while Kitsai falls between them and Wichita.

Language Structure

The Caddoan languages have extremely small phoneme inventories, but complex morphophonemics. They are morphologically and syntactically prototypical examples of polysynthetic structure. The proposed phoneme inventory for the family is */p, t, k, c (= [ts]), s, w, n, r, y, ʔ, h, i, a, u/ (Chafe, 1979: 218–219). Caddo has a somewhat larger set, which appears to result from relatively recent expansion.

Caddoan verbs consist of 30 or more positional slots into which bound morphemes may be inserted; the verb root occurs near the end. In addition to expected categories like tense, modality, aspect,

Caddoan Languages

D Rood, University of Colorado, Boulder, CO, USA

© 2006 Elsevier Ltd. All rights reserved.

Caddoan is a family of North American language consisting of two branches: Caddo, formerly spoken in Texas and Louisiana, and now spoken only in Oklahoma; and North Caddoan, found in the central Plains from Oklahoma to North Dakota. The North Caddoan languages include Arikara, Pawnee, Kitsai, and Wichita. Arikara and Pawnee are linguistically very close, while Kitsai falls between them and Wichita.

Language Structure

The Caddoan languages have extremely small phoneme inventories, but complex morphophonemics. They are morphologically and syntactically prototypical examples of polysynthetic structure. The proposed phoneme inventory for the family is */p, t, k, c (= [ts]), s, w, n, r, y, ʔ, h, i, a, u/ (Chafe, 1979: 218–219). Caddo has a somewhat larger set, which appears to result from relatively recent expansion.

Caddoan verbs consist of 30 or more positional slots into which bound morphemes may be inserted; the verb root occurs near the end. In addition to expected categories like tense, modality, aspect,

pronoun, number, evidential, and verb root, there are slots for certain adverbs, incorporated objects, patient definiteness (in Wichita and possibly others), and derivational stem-forming elements. All the languages have a bipartite verb stem for many verbs; a class of 'preverbs' occurs separated from the root by several slots.

Nouns generally may take only one of two or three suffixes: an 'absolutive' (which occurs only when the noun is used alone), a locative, or, in some of the languages, an instrumental. Noun compounds are frequent and productively formed. All the languages lack adpositions and most adjectives.

Sentential argument structure (subject, object, indirect object, possessor) is marked entirely in the verbal complex; word order in clauses has strictly pragmatic functions. Intransitive verbs fall into two classes depending on whether their subjects are marked by transitive object pronouns or transitive agent pronouns.

History and Scholarship

Europeans first encountered speakers of Caddoan languages during the 16th-century Spanish expeditions from Mexico searching for Quivira (the land supposed to have included El Dorado, a rumored but non-existent city with streets of gold). Maps from those expeditions record a few (now largely uninterpretable) place names, but beyond that most information on the languages has been collected since the 1960s. Kitsai was recorded as spoken by its last monolingual speaker in the early 20th century, but none of the data has been published. The other languages continued to have a few speakers at the beginning of the 21st century, but all will probably be extinct by 2025, despite language preservation and revival efforts.

Large text collections and good grammars are available for two of the languages, Arikara and Pawnee, thanks to the work of Douglas R. Parks. Parks has also coauthored a series of Arikara teaching grammars and a dictionary for elementary school students. Wichita is documented in a grammar, several articles about grammatical phenomena, and a few texts by David S. Rood, as well as audio and video documentation archived at the Max Planck Institute for Psycholinguistics in Nijmegen, the Netherlands. For Caddo, see the texts by Wallace L. Chafe and the detailed description of verb morphology by Lynette Melnar. Allan R. Taylor and W. L. Chafe have published on the history of the Caddoan language family (see Chafe, 1979, for further reading).

Caldwell, Robert (1814–1891)

J-L Chevillard, CNRS – Université Paris 7, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Among all the Europeans who have studied the languages of south India, Bishop Caldwell (see Anonymous, *IJDL XVIII–1*, 1989 for his biography) is probably one of the most famous. He was born in Ireland and arrived in India in 1838 as a protestant missionary. In his *Comparative grammar of the Dravidian or south-Indian family of languages*, first published in 1856 in London, he is credited with demonstrating what had been until then hypothesized by earlier writers (*see* **Ellis, Francis Whyte (ca. 1778–1819)**), namely that several languages of south India are related and belong to one and the same family. Caldwell called this family 'Dravidian,' from the Sanskrit *drāviḍa*, which had sometimes been used to refer to the Tamil language and people, and sometimes more vaguely to south Indian peoples (see Krishnamurti, 2003: 1–2). From Caldwell onwards, the word 'Dravidian' has frequently been used mainly in two contexts: (1) comparative Dravidian linguistics, where Caldwell's (1875) lists of "six cultivated dialects" (Tamil, Malayalam, Telugu, Canarese (Kannada), Tulu, and Kudagu) and "six uncultivated dialects" (Tuda (Toda), Kôta (Kota), Goṇḍ, Khond (Kui), Orâon, and Râjmahâl) have now been extended to "23 modern languages plus three ancient ones" (Steever, 1998); and (2) politics, with the success of parties such as the DMK, or *Tirāviṭa Muṉṉēṟṟak Kaḻakam* 'Dravidian Progress Association' (see Ramaswamy, 1997). Some of the most significant continuators of Caldwell's theories in the field of Dravidian linguistics in the 20th century have been Jules Bloch and M. B. Emeneau, the latter one being responsible, along with T. Burrow, for the important *Dravidian etymological dictionary* (1984). Caldwell is also known for his 1881 *A political and general history of the district of Tinnevelly, in the presidency of Madras, from the earliest period to its cession to the English government in* A. D. *1801*. He is one of three Europeans (along with Beschi and Pope) to have his statue near the Marina Beach in Chennai.

Calligraphy, East Asian

A Gaur, Surbiton, Surrey, UK

© 2006 Elsevier Ltd. All rights reserved.

Chinese calligraphy depends on the brush, paper (created in the 2nd century A.D.), and the multiple forms of Chinese characters. Chinese painters and calligraphers use the same instruments and the same material, but most artists would rather be remembered as calligraphers than as painters. In China, calligraphy is art, perhaps the highest form of art possible. Another distinguishing point is the fact that it was practiced amongst equals, it was never simply commissioned. In calligraphy, it is not only the hand that writes, but the whole arm, the whole body and above all, the whole mind.

The earliest known examples of Chinese writing go back to the Shang period (*ca.* 1766–1122 B.C.) to a script called Jiaguwen. The next script, Jinwen zhongdingwen, was used during the Zhou period (late 11th century B.C.) but did not yet exhibit many signs of calligraphic distinction. It was supplanted by the Great Seal script, Dazhuan, which flourished between 1700 and 800 B.C. In the 3rd century B.C., China was finally united under the first Qin Emperor Shi Huang Di (259–210 B.C.), and (we are told) on his instructions a new script, Xiaozhuan, the Small Seal script, was created to meet the growing demand for documents and records. Though it was the basis for later calligraphic developments, it was still only written with the tip of a longhaired brush, mainly on bamboo slips or wood. In addition, Xiaozhuan could not be written with speed, a serious shortcoming for a script specially designed to serve an increasing bureaucracy.

However, Lishu (the 'clerical script'), a simplified version of the Small Seal script, which allowed the brush to move swiftly over paper, was designed. Between 200- and 400 A.D. three more variations of Lishu came into existence: Caoshu (*fl.* 200–400 A.D.), Xingshu (*fl.* from the 3rd century A.D. to the present) and the most important variation Kaishu, the 'proper style of Chinese writing.' Kaishu was used for public documents and private correspondence, and eventually also for block printed books. It also served as an examination subject in the Civil Service examination, which started during the Tang period (618–907 A.D.) and was abolished only in 1905.

Kaishu allowed for a maximum of individuality. Its greatest exponents were the 'the two Wangs' (father and son) who lived in the 4th century A.D. and influenced not only Chinese but also Korean and Japanese calligraphy. Wang Xizhi relaxed the tension in the arrangements of strokes and by doing so furthered the two other styles: Xingshu the 'running script' and Caoshu the 'grass script.'

Chinese script, paper, ink, and the Chinese way of writing were brought to Korea and Japan during the earlier part of the first millennium A.D. But the Korean and the Japanese languages are ill suited for being written in Chinese characters and fairly soon attempts at simplification were made. In 1446, the Korean King Sejong promulgated an alphabetic script called Hangul, which consisted of only 11 basic vowels and 17 consonant signs. Korean could have been written in this script at this time, but the hostility of the Chinese educated elite relegated it mainly to the use of women authors and people of low rank. Overall, Korean calligraphers relied on copying the great Chinese masters. During the Koryo dynasty (918–1892), a square angular form was used; this was eventually followed by the *zhao* style, again copied from the Chinese calligrapher Zhao Mengfu (1254–1322). The most famous calligrapher of the Choson period (1392–1910) was Kim Ch'ong hui (1786–1856), a member of the School of Practical Learning. After World War II, Korean calligraphy lost its importance, but today there is, for the first time, an attempt to use calligraphy based almost exclusively on King Sejong's Korean alphabet.

In Japan, the situation was similar. Between the 8th and the 10th centuries, two syllabaries, *katakana* and *hiragana*, appeared, provoking similar reactions from the Chinese-speaking elite as in Korea. Proper Japanese calligraphy begins in the Nara period (710–794 A.D.) written in *kanji* (Chinese characters) mostly based on Chinese Tang models and the 'two Wangs.' Buddhist sutra literature preferred *kanji* styles such as Kaisho, Gyosho, and Sosho. In the 9th century, during the Heian period (794–1185), Japan had terminated the embassies to China, and Japanese calligraphers began to interpret, not just copy, Chinese models. The Heian period also saw new and more sophisticated trends, such as novels written by women entirely in an elegant *hiragana* style known as *onnade* (women's writing).

The 16th century once more encouraged close contacts with China, and new styles of Ming calligraphy were taken up, but a century later the pendulum swung back to Japanese, largely through the masters of the Kan'ei period (1624–1644). Apart from the *wayo* (Japanese) tradition, there developed another highly original style of calligraphy, which traces its origin back to Chinese Chan Buddhism. In reaches as far back as the 13th century, when the Zen Sect was formed by the monks Eisai (1141–1215) and Dogen (1200–1253). In the newly founded Zen monasteries,

a special type of calligraphy developed, referred to, especially after the 14th century, as Bokuseki (traces of ink). This is a greatly distinct form of calligraphic writing and it eventually became connected with the aesthetics of the tea ceremony.

Today calligraphy is still held in highest esteem in Japan, and the work of good calligraphers sells at adequate (or as we would call it) exuberant prices.

Islamic calligraphy begins with the Qur'an and the need for its precise and appropriate transmission. The sacred text had been revealed in Arabic over a period of some 23 years to the Prophet Muhammad, which gave both language and script a new status. At first the various parts were preserved, either through oral traditions or recorded on different materials (wood, paper, parchment, bone, leather, etc.). In 633 A.D., during the battles following Muhammad's death, many of the story tellers (*huffaz*) were killed, and fearing for the safety of the revelation, Abu Bakr (r. 632–634 A.D.), the first Caliph, instructed one of the Prophet's secretaries to compile the full text into one book. The book that appeared in 651 A.D. still forms the authentic version of every Qur'an.

In the 7th century, the Arabs possessed a script of their own, a stiff angular development of Nabataean called Jazm, which was mainly used for commercial purposes. The earliest copies of the Qur'an were written in variations of Jazm named after the towns where they had originated: Ambari (after Anbar), Hiri (after Hirah), Makki (after Mecca), Madani (after Medina), and so on. None of them was well defined and only two achieved a measure of prominence: a round form used in Median called Mudawwar and a more angular form under the name of Mabsut. Finally, after a number of experiments, a style developed named after the city of its origin: Kufah. This was a bold, elongated and straight-lined script, which for the next 300 years became the main script for copying the Qur'an. By the late 10th century, two distinct forms of Kufic emerged: eastern Kufic that developed in Persia and western Kufic, eventually called Maghribi. Maghribi originated around Tunis and became the source of various scripts of North and West Africa, and of Andalusia. After the 13th century, Kufic went out of general use and was from then on mainly used for decorations.

Besides the elongated Kufic, a number of more rounded, cursive scripts had been used for personal use and for administration. Early attempts at improvements had led to the creation of some 20 different styles, many short-lived, all lacking elegance and discipline. In the 10th century, Ibn Muqlah (886–940 A.D.), an accomplished Baghdad calligrapher, set out to redesign them so as to make them suitable for writing the Qur'an. His system of calligraphy rested on mathematical measurements: the rhombic dot, the standard *alif*, and the standard circle. The rhombic dot, formed by pressing the pen diagonally on paper so that the length of the dot's equal sides were the same as the width of the pen; the standard *alif*, a straight vertical line measuring a specific number of dots (mostly between five and seven); and the standard circle, which has a diameter equal to the length of the standard *alif*. Thus the various cursive styles were ultimately dependent on the width of the pen and the number of dots fashioning the standard *alif*.

Ibn Muqlah's reform (known as *al-Katt al Mansub*) was successfully applied to the *sittah*, the six major styles known as Thuluth, Naskhi (the most popular form of writing in the Arab world and, after 1000 A.D., the standard script for copying the Qur'an), Muhaqqaq, Rayhani (another popular Qur'an script), Riqa (favored by the Ottoman calligraphers), and Tawqi. Under Ibn Muqlah's influence, four more styles

a special type of calligraphy developed, referred to, especially after the 14th century, as Bokuseki (traces of ink). This is a greatly distinct form of calligraphic writing and it eventually became connected with the aesthetics of the tea ceremony.

Islamic calligraphy begins with the Qur'an and the need for its precise and appropriate transmission. The sacred text had been revealed in Arabic over a period of some 23 years to the Prophet Muhammad, which gave both language and script a new status. At first the various parts were preserved, either through oral traditions or recorded on different materials (wood, paper, parchment, bone, leather, etc.). In 633 A.D., during the battles following Muhammad's death, many of the story tellers (*huffaz*) were killed, and fearing for the safety of the revelation, Abu Bakr (r. 632–634 A.D.), the first Caliph, instructed one of the Prophet's secretaries to compile the full text into one book. The book that appeared in 651 A.D. still forms the authentic version of every Qur'an.

In the 7th century, the Arabs possessed a script of their own, a stiff angular development of Nabataean called Jazm, which was mainly used for commercial purposes. The earliest copies of the Qur'an were written in variations of Jazm named after the towns where they had originated: Ambari (after Anbar), Hiri (after Hirah), Makki (after Mecca), Madani (after Medina), and so on. None of them was well defined and only two achieved a measure of prominence: a round form used in Median called Mudawwar and a more angular form under the name of Mabsut. Finally, after a number of experiments, a style developed named after the city of its origin: Kufah. This was a bold, elongated and straight-lined script, which for the next 300 years became the main script for copying the Qur'an. By the late 10th century, two distinct forms of Kufic emerged: eastern Kufic that developed in Persia and western Kufic, eventually called Maghribi. Maghribi originated around Tunis and became the source of various scripts of North and West Africa, and of Andalusia. After the 13th century, Kufic went out of general use and was from then on mainly used for decorations.

Besides the elongated Kufic, a number of more rounded, cursive scripts had been used for personal use and for administration. Early attempts at improvements had led to the creation of some 20 different styles, many short-lived, all lacking elegance and discipline. In the 10th century, Ibn Muqlah (886–940 A.D.), an accomplished Baghdad calligrapher, set out to redesign them so as to make them suitable for writing the Qur'an. His system of calligraphy rested on mathematical measurements: the rhombic dot, the standard *alif*, and the standard circle. The rhombic dot, formed by pressing the pen diagonally on paper so that the length of the dot's equal sides were the same as the width of the pen; the standard *alif*, a straight vertical line measuring a specific number of dots (mostly between five and seven); and the standard circle, which has a diameter equal to the length of the standard *alif*. Thus the various cursive styles were ultimately dependent on the width of the pen and the number of dots fashioning the standard *alif*.

Ibn Muqlah's reform (known as *al-Katt al Mansub*) was successfully applied to the *sittah*, the six major styles known as Thuluth, Naskhi (the most popular form of writing in the Arab world and, after 1000 A.D., the standard script for copying the Qur'an), Muhaqqaq, Rayhani (another popular Qur'an script), Riqa (favored by the Ottoman calligraphers), and Tawqi. Under Ibn Muqlah's influence, four more styles

were eventually accorded similar status: Ghubar, Tumar, Ta'liq, and Nasta'liq. Those cursive styles were eventually further perfected by two other famous calligraphers: Ibn al-Bawwab (d. 1022 A.D.) and Yaqut (d. 1298).

Ibn Muqlah's reform had not been accepted in the Maghrib, the western part of the quickly extending Muslim empire, where copying acknowledged masters preserved the purity of the style. Between 800 and 1200 A.D., the city of Kairouan (now Tunis) was an important religious and cultural center. The Maghribi style introduced a rounding of rectangular curves into semi-circles while the final flourishes of letters are often extended, sometimes touching other letters in the adjoining word. Maghribi became the main script in Northwest Africa and Spain and was responsible for the creation of important substyles such as Qayrawani, Fasi, Andalusi, and Sudani.

After the extension of Islam to Persia, Turkey, and further east to Malaysia (even China), the Arabic script had to be adapted to languages belonging to different linguistic families. This meant some changes in the script but it also opened the possibility for new forms of calligraphy.

In the 16th century, Persian calligraphers developed Ta'liq, an already existing style, which became influential in the eastern part of the Islamic world, gaining special favor in Turkey and India. A later development of the same style, Nasta'liq, was mainly used for secular literature. In the middle of the 17th century, a style called Shikasthe ('broken form') developed in Herat. Characterized by exaggerated density and closely connected ligatures, it became the preferred script for Persian and Urdu correspondence. Persian calligraphers and Persian influence brought Nasta'liq to India and Afghanistan. During the 14th century, a minor Indian style called Bihari arose, which was characterized by the use of colors. Chinese Muslims generally used the style prevalent in Afghanistan but a special script called Sini, sometimes written with a brush, was used for writing on ceramic and china.

Soon after the defeat of the Mamluks in 1517, Turkish dominion extended over most of the Arab world. From then on, Islamic art and calligraphy became increasingly associated with the Ottoman Turks who not only excelled in most calligraphic styles but also created some highly effective scripts of their own. The two most important are Diwani and Jali. The Turks also excelled in the art of mirror writing, where the left side reflects the writing on the right. Another style, Siyaqad, combines complexity of line with elements of cryptography and was used to communicate important political information. An impressive calligraphic device is the Tughra, an ornamental design based on the name and titles of the reigning Sultan that served as a signature legitimizing official degrees.

Although the term 'calligraphy' derives from *graphein* (to write) and *kallos* (beautiful), beautiful writing in itself is not calligraphy. Fine writing, even the development of distinct styles, is not necessarily calligraphy. Calligraphy makes a statement about a particular society, a statement about the sum total of its cultural and historical heritage. As such, it results from the interaction between several essential elements: the attitude of society to writing; the importance and function of the text; definite, often mathematically based rules about the correct interaction between lines and space and their relationship to each other; and mastery and understanding of the script, the writing material, and the tools used for writing. Calligraphy is to a large extent an expression of harmony, as perceived by a particular society. Calligraphy also encourages a certain amount of individuality, though within strictly confined

circles. Only three civilizations have produced true calligraphy: the Arabs (and those who use the Arab script), the Chinese (and those who use the Chinese script), and Western civilization based on Roman letters, Roman laws, and the Christian Church.

India, and with it the scripts of South and Southeast Asia that developed from Indian prototypes, did not create calligraphy in the strictest sense of the word, mainly for two reasons. First there was the lack of writing materials and writing tools suitable for calligraphy: palm leaves into which the letters had to be incised with a metal stylus (or in the north written with a reed pen), and secondly the attitude to writing. Though writing, as is generally assumed, had been introduced by Semitic traders in the 6th or 7th century B.C., Hinduism, the religion of the area, was decisively hostile to it. The memorizing and the recital of the Vedic hymns was predominately the property of certain Brahmanical subcastes whose status deepened on maintaining this monopoly. Buddhism too, though not overtly hostile to writing, placed the importance of the text above its visual representation. Monks should not take delight in visual beauty. In consequence, the vast majority of South Indian and Sri Lankan palm-leaf manuscripts are at best only adequately, and indeed often indifferently written. Indian manuscripts, and with it Indian scripts, are predominantly meant to provide information.

Only a few surviving manuscripts from India predate the 11th century, and those come mostly from the north or from the Jain area. Though some have beautiful illustrations, the script (whether Siddhamatrika or Kutila) is well done but uninspiring. In Tibet, where writing was introduced together with Buddhism, in the 7th century A.D., writing was taught in the monasteries as part of the curriculum. Only about three styles developed: a book hand (*dbu-can*), a more cursive script for everyday life (*dbu-med*) or for official documents (*bam-yig*), and decorative scripts *(bru-tsha*). None of them displayed any calligraphic traditions.

Fine writing did, however, play a major part in the complex and esoteric world of Hindu Tantras, popular Daoism, and most of all Tantric Buddhism. It was in Tantric Buddhism that beautiful writing, combined with other elements, eventually moved toward calligraphy. The script that underwent this transformation was *siddham*, an Indian syllabic script that goes back to the Indian Gupta period (320–647 A.D.).

According to the legends associated with Tantric Buddhism, the siddham letters 'exploded' out of emptiness and were taught by the Buddha but kept secret until the Indian saint Nagarjuna revealed them to his disciples. From the 7th century onward, siddham letters were mostly used for the representation of 'seed syllables' within mantras (sacred diagrams), each letter personifying a different cosmic force of the Buddha. Awareness of emptiness, so the teaching goes, is transformed into a seed syllable, from the seed develops the Buddha, who may be portrayed by an icon (in this case the seed syllable), and contemplation of the icon unites the devotee with the seed and returns him to emptiness.

Buddhism brought Sanskrit texts, mainly written in siddham script, to China. Unlike India, China had always given much importance to the written word, since the large number of different dialects made oral communication difficult. In keeping with this attitude, Chinese Buddhists paid great attention to the form and the correct construction of siddham characters. Once the pen was replaced by the Chinese brush, siddham became a special branch of Chinese calligraphy connected with sacred writing. From China, Buddhism brought the siddham script to Korea, and in the 9th century two Japanese monks, Kukai (773–835 A.D.) and Saicho (767–822 A.D.), who had both studied in China, introduced it to Japan, where it soon gained considerable popularity within certain circles. Both the Heian (794–1185) and the Kamakura period (1185–1333) produced a number of siddham masters. After a period of decline, siddham calligraphy re-emerged in the 17th century. It is still an important calligraphic tradition and has indeed experienced something of a renaissance. There are today prominent modern siddham masters whose work is much valued, aesthetically as well as financially.

Calligraphy, Western, Modern

A Gaur, Surbiton, Surrey, UK

© 2006 Elsevier Ltd. All rights reserved.

The 20th century saw a remarkable revival of Western calligraphy. The motivation for it lay partly in a growing unease about some of the more ugly aspects of the Industrial Revolution. Life now seemed increasingly dominated by shoddy, machine-made objects, which no longer had any direct connection with their users. This brought about a nostalgic yearning for the past and with it a growing interest in medieval art and craftsmanship. Such sentiments were intellectually underwritten by the philosophy of John Ruskin (1819–1900), by artistic movements such as the Pre-Raphaelite Brotherhood and to some extent the Gothic Revival. The eventual re-emergence of calligraphy was, however, largely rooted in the stimuli created by the Arts and Crafts Movement of the 1880s and 1890s, the work of William Morris and, most of all, Edward Johnston.

Calligraphy in Britain

Between 1870 and 1876, the poet, writer, and (greatly idealistic) Socialist William Morris (1834–1896), who until then had been much occupied with creating designs for wallpapers, glass, textiles, tapestry, and print, turned his attention to medieval and humanistic-style manuscripts. He experimented with various scripts, studying scribal techniques and using quill and parchment to achieve results. His calligraphy shows good rhythmic quality but lacks an understanding of the shape of letters and their inner relationship. Nevertheless, his manuscripts, and the research and patronage connected with his work, created great interest and opened the way for calligraphic reforms. In 1890, Morris founded the Kelmscott Press and successfully tried his hand at engraving, type designing, and high-quality printing. In the same year, T. J. Cobden-Sanderson's Doves Press was created. Both presses considerably increased the status of the book, eventually commissioning calligraphers to design the type. In due course, Morris became one of the moving spirits behind the Central School of Arts and Crafts, which had originally been founded in 1896 by William Richard Lethaby (1857–1931). There, eventually, Sir Sidney Carlyle Crockerell (1867–1962), one of Morris's secretaries, taught calligraphy and lettering.

It was, however, Edward Johnston (1872–1944) who was most decisively responsible for the renewal of Western calligraphy. Impressed by Morris's ideas, he abandoned his study of medicine and turned his attention to the manuscripts in the British Museum. In the process, Johnson rediscovered the lost technique of writing. He realized that the nature and form of a script were determined by the way the pen was held, that the proportions of a letter stood in direct ratio to the breadth of the pen's edge, which, trimmed chisel-wise, could produce that range of graduation from the thickest strokes to the finest of hairlines that characterized the best medieval works. He also taught himself how to cut and sharpen reeds, bamboo, and quills.

In 1898, Johnston began to teach, first at the Central School of Arts and Crafts and, later, at the Royal College of Art (where Lethaby worked as Professor for Ornament and Design). As a teacher, Johnston had a decisive influence on calligraphy and typography, particularly in England and Germany. His pupils included Eric Gill (who later became a well-known sculptor, engraver, and letterer), Noel Rooke (who engraved illustrations for Johnson's later works), William Graily Hewitt, Percy J. Delf Smith (who became the honorary Secretary of the short-lived Society of Calligraphers), and most of all the highly gifted Anna Simons (who introduced Johnston's method to Germany, Austria, Switzerland, and the Netherlands).

Other art schools followed the example of the Royal College of Art, offering courses in lettering and writing. The first was Birmingham; Leicester College of Art came next, and eventually the subject became part of the curriculum in most arts schools throughout the country. Type design, which had for so long been in the hands of engineers, passed into the hands of artist and calligraphers such as Stanley Morison, Jan van Krimpen, Bruce Rogers, and Victor Hammer. By selecting fine alphabets for font material, they ensured that those alphabets were used for books (printed as well as manuscript) and book covers, and they began to influence the private market. Johnston himself had done some of his best work for church service books, wedding gifts, presentations and the like as a result of commissions from private patrons and public bodies. Calligraphy had always been used for such purposes, but now it received a new impetus and new quality.

In 1906, Johnston published his first book, *Writing & illuminating & lettering*. It consisted of 500 pages, illustrated with his own and Rooke's drawings, and reproductions from historic manuscripts. It was instructive, stimulating, technically helpful, and in due course it became an important handbook for calligraphers, not only in Britain but also in Germany,

the United States, and Australia. Three years later, Johnston's second book, *Manuscript and inscription letters*, appeared, including a number of plates by Eric Gill; it was specially meant for schools and craftsmen. Other writing manuals followed. In 1916, Graily Hewitt's *Handwriting manual* was published. Hewitt had replaced Johnston at the Central School for Arts and Crafts 4 years earlier. He admired the Humanist manuscripts of the 15th century but his great achievement was the recovery of the craft of laying and burnishing gold leaf. Alfred Fairbank, one of his students, turned his interest to italic handwriting. One of his aims was the improvement of everybody's handwriting. In 1932, his *A handwriting manual* came out. It was a forerunner of books on italic script. In 1952, Fairbanks became President of the Society of Scribes and Illuminators (SSI) and encouraged the formation of a Society for Italic Handwriting. Finally, in 1955, J. H. Benson's *The first writing book: Arrighi's 'La Operina'* appeared, going back to the early copybooks of the Italian masters.

In 1915, the London Transport Services commissioned Johnston to design a new alphabet for publicity and signs; the letters can still be seen all over London, especially on the underground. His result was a *sans serif* block letter alphabet based on classical Roman proportion, which, during the coming decades, exerted considerable influence on the choice of letterforms used in advertising. By reaching commerce, calligraphy began to play a role in the everyday life and the everyday business of people. Newspapers, journals, and magazines began to display more lavish and in many cases better-written and better-composed advertisements. It was (and is) indeed in the sphere of advertising that many calligraphers found a new and lucrative outlet.

The Society of Scribes and Illuminators (SSI) was founded in 1921. The idea came originally from Graily Hewitt and Laurence Christie, who had both been students of Johnston and were now teaching at the Central School of Arts and Crafts. The Society held its first exhibition a year later in Brook Street Gallery: it showed 106 works by 31 members of the Society. In the beginning, it was fairly easy to be accepted by the Society as a Fellow but as time passed higher and higher standards were required and the reputation of the Society rose. In 1924, the Society set up small research groups to study particular problems and techniques: writing on skins, quality of pigments, preparation of inks, methods of gilding, and styles of cursive handwriting. The result of this research provided the basis for the compilation of the first *Calligrapher's handbook* compiled during the 1950s. The Society also produced an excellent, worldwide, and still active journal: *The Scribe*. Several members (such as Alfred Fairbank and Joan Kingsford) wrote manuscripts for private clients; some of them can still be seen in national museums and libraries.

Already in 1931, the Society of Scribes and Illuminators had arranged, together with the Victoria and Albert Museum, an exhibition of *Three centuries of illuminated addresses, diplomas and honorary freedom scrolls*. The exhibition included five Freedom Scrolls made for City Livery Companies by Edward Johnston and a good number of presentation addresses executed by Graily Hewitt, Ida Henstock, Laurence Christie, Daisy Alcock, and others. With the increase in calligraphic activities in Great Britain, some exhibitions were (in 1930 and 1938) sent to the United States, the first at the invitation of the American Institute of Graphic Arts. The second exhibition was shown in New York, Boston, Chicago, as well as the Universities of Yale and Pittsburgh. Other exhibitions followed. They gave contemporary calligraphy an opportunity to come to the attention of a wider public. The years following World War II created a need for Rolls of Honor and provided the Society of Scribes and Illuminators with new opportunities.

The manipulation of letterforms has always been at the center of Western calligraphy. The 20th century's revival of the craft was closely connected with a reform of letter carving. In England, this reform, largely promoted by Eric Gill, based itself to a considerable extent on the Roman lettering of Trajan's column. Analyzed in detail, such letters were soon taught in every art school and became models for sign writing, street names, memorials, foundation stones, and so on.

Calligraphy and 20th-Century Art

The new use of letterforms touched other aspects of life as well. Especially on the Continent, graphic artists, painters, and (mostly) politically motivated groups of artists such as the Dadaists, the Constructivists, and the more moderate Bauhaus, began to involve lettering in their publications.

The Dadaists, founded in 1917 in Zurich, were nihilistic groups of artists, who aimed at demolishing current aesthetic standards that they linked with bourgeois values. Seeing letters as the normal expression of a conventional society, they began to turn them into instruments of attack. The chaos of typefaces used for their magazine *Dada* illustrates this point. The Constructivists used the disposition, the size, and the weight of the components of individual letters to create unique abstract patterns, which they saw as representation of the contemporary machine age and the new revolutionary order in Russia, which had replaced the previous decadence. Their

work included posters, advertisements, letters, and newspaper headings; their preferred letterform was the *sans serif,* a functional letterform without historical commitment. Most important, however, was the Bauhaus, which in many ways reacted more positively than the others. It flourished in Germany between 1919 and1933 and its aim was to end the schism between art and technically expert craftsmanship. Though their interest centered around architecture, they soon began to teach typography in order to find new and positive letterforms.

Painters too began to treat letters as an important part of their visual vocabulary. Cubists, Surrealists and the Collagists began to include single letters, or fragments of newspapers, in their paintings. The secret writing pictures of Paul Klee (1879–1940) and Max Ernst (1891–1976) used at first still legible writing that did, however, soon turn toward more abstract brush movements in the hands of Mark Tobey and Hans Hartung (1904–1989). Letters in a painting were used to underline themes, add a message, and they thus became an integral part of the picture itself; or they could simply provide a visual effect by using the idea of layout linked to meaning. A good many artists have used (and are using) lettering in this way. From Pablo Picasso (1881–1973) and Joan Miro (1893–1983) to Franz Kline (1910–1962), who under De Kooning's influence developed his characteristic action painting of slashing black and white calligraphy, and eventually Andy Warhol (1928–1987), Roy Lichtenstein (1923–1997) and the Pop Art Movement as such. Pop Art, which emerged in the 1950s, set out to challenge conventional ideas of good taste and the hermetic inviolability of art itself; the use of letters is often in the form of advertisements and billboards, reminiscent, at times, of the early Construtivists.

The first half of the 20th century saw a good deal of success in revitalizing calligraphy and related crafts. This success depended mainly on three elements:

1. teaching lettering and calligraphy in arts schools, polytechnics, and similar institutions;
2. the growing number of exhibitions, many of them in connection with the United States and the Continent;
3. the foundation of societies and the publications of journals and books, which greatly encouraged the rising of standards.

Since well before World War II, and for quite some times afterward, calligraphy was taught in almost every school. It was one of the subjects included in the National Diploma, which was a B.A. equivalent course. It was also taught at the Royal College of Art, a postgraduate college where the diploma is equal to an M.A. But in 1953, calligraphy was discontinued at the Royal College of Art. In the early 1960s, it received a second blow, the National Diploma was replaced by the Diploma in Art and Design (a B.A.) and calligraphy was no longer included in the new courses, and was almost totally phased out as an examination subject. The only exceptions were the Reigate School of Art where it is still taught. Roehampton Institute of Higher Education started a 1-year Diploma course in calligraphy and bookbinding in 1979, and also an advanced Diploma in Calligraphy. Around 2003, bookbinding was dropped. Reigate and Roehampton are (it seems) now the two main institutions that still teach calligraphy in Great Britain.

Now that calligraphy is no longer taught officially at university level, adult education institutes throughout Great Britain are putting on courses – of often widely varying value. The Society of Scribes and Illuminators also runs a number of workshops and some residential courses, which are advertised in their journal. Still flourishing as well is the Society for Italic Handwriting founded in 1952 under the direction of Alfred Fairbank. The year 1971 saw the establishment of the government-funded Crafts Council, which provided grants.

In 1994, CLAS (Calligraphy and Lettering Arts Society) was founded. CLAS has its own website, and it runs Diploma and Advanced Diploma courses, Certificates, annual festivals, and exhibitions. It has accredited tutors and keeps in contact with American calligraphers. The first major exhibition was held in 2002 and the society is now preparing for its Tenth Anniversary Exhibition. A magazine, *The Edge,* is regularly published and free to all members. CLAS provides a variety of courses and a Certificate of Competence. It operates an annual examination and awards diplomas on three progressive levels. Its main advantage is that it is in principle open to everybody but carefully tutors and examines those who are allowed to teach. There is, in fact, a good deal of enthusiasm for calligraphy at the moment in Britain.

An often voiced complaint is the lack of excellent teachers. This, however, does not mean that there are no longer any impressive calligraphers. We only have to think about Ann Camp, Donald Jackson, Heather Child, Sheila Waters, and Ann Hechle – to name but a few.

Calligraphy in Europe

The 20th century revival in the art of lettering and writing was not restricted to Britain. Parallel (and not unconnected) movements occurred in other parts, most notably in Austria and Germany. The traditional alphabets in Germany and Austria had proceeded

along different lines, keeping the Gothic script until the 1930s.

In Austria, the main exponent was Rudolf von Larisch (1856–1934), who worked in the Imperial Chancellery in Vienna where he had ample opportunity to study historical manuscripts and compare the various hands he found there with the (far less impressive) contemporary standards. His *Zierschriften im Dienst der Kunst* (Decorative lettering and writing in the service of art) was published in 1899. It led, 3 years later, to a teaching appointment at the Vienna School of Art. His publication appeared 7 years before Johnston's work, but soon rivaled its standing in Austria. Unlike Johnston, von Larisch did not believe that calligraphy rested on the study of historic hands but was a natural vehicle for creative self-expression. Though he held different views and encouraged different teaching methods, in 1909, when Larisch and Johnston met in London, they found themselves in mutual sympathy. Larisch's most important work, *Unterricht in Ornamentaler Schrift* (Instruction in decorative writing and lettering), published in 1906, further extended the scope of his studies and had considerable influence in German-speaking countries. Applying calligraphy on glass, metal, textiles, wood, and pottery fascinated him. He believed that calligraphers should express intuitive feelings in their work and that the pattern of letters on the page should be in harmony with the rhythm of writing and the material used.

In Germany, it was Anna Simons (1871–1951), Johnston's favorite pupil, who became instrumental in strengthening the link between German and English calligraphers. From a Prussian legal family, she began to study with Johnston in 1901 and became his best student. After retuning to Germany, she translated Johnston's two books (*Writing & illuminating & lettering* in 1910 and later *Manuscript and inscriptional letters*) and helped with exhibitions.

It was, however, mainly Rudolf Koch (1874–1934) who initiated the movement. He was a skilled calligrapher who had close ties with type and type design. He worked at the Klingspor type foundry and taught lettering at the School of Arts and Crafts in Offenbach. In 1918, under his leadership, a group called the Offenbach Penmen was founded. It later became a workshop community, where people worked on lettering, woodcuts, embroidery, weaving, and books written on Japanese paper. Many of the people there became leading teachers in Germany, Austria, the United States, and England. Whereas Johnston had seen writing as the central discipline of his craft, Koch gave this place to lettering in the broadest sense.

In Europe, the link between art schools, printing houses, and the workshops of craftsmen had always been much closer than in Britain; most early pioneers in calligraphy were also type designers of some note. This dual tradition was kept alive in the work of calligrapher/type designers such as Friedrich Poppl (1893–1982), who said that "calligraphy will always remain the starting point for script design." Poppl was a member of the Arts and Crafts School at Wiesbaden and later professor at the Technical College there. He specialized in designing alphabets for typesetting and photo printing.

Another important German calligrapher was Walter Kaech (d. 1970), who taught lettering for many years. Imre Reiner studied graphic arts in Stuttgart and was well known for his lively calligraphic inventions and type designs. The same can be said of Karl Georg Hoefer and, most prominently, Hermann Zapf (b. 1918). Zapf enjoyed a great reputation as a calligrapher, book designer, and typographer.

In the Netherlands, this claim goes to Jan van Krimpen (1892–1958), in Czechoslovakia to the book artist and calligrapher Oldrich Menhart (1897–1962), in Estonia to Villu Toots (b. 1916), an outstanding teacher and exponent of lettering. There are now in fact several hundred graduates from the lettering school he founded in 1965, including his own grandchildren. The most important penman in Scandinavia is Erik Lindegren, whose survey of *Lettering and printing types* was published in 1975. All of them looked for new ways to link tradition with new means of expressing letterforms.

In the last few decades, the influence of Austria and Germany has been strongly felt in the United States. The effects of exhibitions such as those produced by Zapf and Friedrich Neugebauer during the 1980s, the development of intensive workshops, and the resulting meetings of craftsmen, have enabled gifted teachers to kindle an enduring enthusiasm.

Calligraphy in the United States

American calligraphy (or interest in writing) had, during the 17th and 18th centuries, mostly been concerned with practical considerations, namely how to improve everybody's handwriting. Some English manuals (William Mather's *Young man's companion*, London 1681; and Edward Cocker's *The pen's triumph*, London 1660) were well known; they taught an English version of Italian Humanistic mixed with remnants of older Gothic hands. The first known American printed manual for handwriting appeared in Philadelphia in 1748 under the imprint of Franklin & Hall. It was George Fisher's *The instructor, or American young man's best companion containing instructions in reading, writing and arithmetic and many other*

things beside the art of making several sorts of wines. It gave examples of Round Hand, Flourishing Alphabets, Italian Hand, and Gothic Secretary. Most of these books had been pirated from English models. There were also tentative attempts to involve the teaching of women, as for example John Jenkins's *The art of writing, reduced to a plain and easy system, on a plan entirely new*, Boston, 1791, which taught an orthodox version of the English unlooped Round Hand to the "Gentlemen and Ladies and to the Young Masters and Mistresses throughout the United States."

During the 19th century, such attempts led to various systems (methods of teaching) and colleges where they could be taught. Over the first half of the century, over 100 writing masters were distributing copybooks that in the main taught rapid writing (a Running Round Hand) to men of business in the form of self-instructors. Among the first manuals were Henry Dean's *Analytical guide to the art of penmanship* (Salem, 1894) and Benjamin Howard Rand's *A new and complete system of mercantile penmanship* (Philadelphia, 1814). Well-known and commercially successful was the Spencerian College of Penmanship and Business which dominated the market for some 35 years. Founded by Platt Roger Spencer (1800–1864) in Ohio, it propagated a sloping, semiangular style, which was rapid and legible, while at the same time lending itself easily to embellishment. Spencer had begun teaching handwriting at the age of 15 and he and his five sons ran the college (and eventually a chain of such colleges in some 44 cities) from a log cabin at the family farm, while at the same time traveling around the country to teach at various academies.

As the 19th century progressed, competition mounted between those who emphasized a plain practical business hand and others who delighted in flourishes, which could occasionally lead to such extravagances as quill-written pen pictures of animals and humans; however, as time passed the 'flourishers' grew increasingly more defensive. Another successful writer/entrepreneur was Charles Paxton Zaner, who in 1888 founded the Zanarian College of Penmanship, also in Columbus, Ohio, which eventually produced a 'commercial cursive' or 'business hand' that, like copperplate in the Old Country, soon found favor among those anxious to advance their career prospects.

Modern American handwriting derives largely from the teachings of H. Dean, B. F. Foster, R. P. Spencer, and A. R. Dunton (who was involved in lengthy disputes with Spencer). At the beginning of the 20th century, the Italic style, and the use of the broad-edged pen were greatly advanced by Frances M. Moore, who after having studied in London under G. Hewitt, published her manual in 1926. Since then, it has been mainly the formal and semiformal Italic hand that has made headway in the United States, finding favor not only as a model for everyday handwriting, but also among those actively engaged in the pursuit of calligraphy. In the beginning, it took some effort to convert teachers and pupils to this style; more recently such books as Fred Eager's *Italic way to beautiful writing* (1974) has given further impetus in this direction.

The usefulness of calligraphy in America and Britain is basically based on different considerations. In Britain, emphasis has been placed on formal purpose, such as ceremonial occasions. In consequence, British scribes have shown a more formal approach to layout and letter style, even when designed for commercial use. In America, the predominant use for calligraphy has been in the commercial field. Calligraphers were also designers who produced a constant flow of lively work to serve a wider commercial field.

At the beginning of the 20th century, several attempts were made to reform not only handwriting, but also lettering and type design. Such reforms centered mainly on men like Frederic W. Goudy (1865–1945), Bruce Rogers (1870–1957) and, most of all, William A. Dwiggins (1880–1956). Dwiggins was a well-known type designer whose calligraphy owed little to European influence and showed great gaiety, character, and originality. In 1925, he founded the (wholly imaginary) Society of Calligraphers and issued beautiful certificates of honorary membership to people who worked in publishing and in the graphic arts whom he considered worthy of such distinction.

The contact with Britain did, however, continue. In 1913, Ernst Frederick Detterer (d. 1947) of Chicago came to London to take private lessons from Edward Johnston. After his return to America, he began to establish a calligraphic tradition of formal penmanship, especially in the midwest. In 1931, he became Curator of the John M. Wing Foundation at the Newberry Library in Chicago, where he founded a Calligraphic Study Group, which greatly influenced the development of American calligraphy.

A versatile calligrapher was John Howard Benson (1901–1956) from Rhode Island, who studied in New York at the National Academy of Design at a time when lettering had not yet attained a recognized place in art education. In 1950, he published a manual *(Elements of lettering*) and 5 years later he produced the first English translation of Arrighi's *La Operina*.

Other influential teachers and calligraphers were Arnold Bank (b. 1908), Paul Standard (b. 1896) and Lloyd Reynolds (*Italic calligraphy and handwriting*; 1969). In 1958, Reynolds went a step further and

mounted an exhibition at the Portland (Oregon) Museum of Art entitled *Calligraphy: The Golden Age and its Modern Revival*, the result of many years of historical study, research, and practical work. Another influential exhibition (mostly works of British calligraphers) was organized by P. W. Filby in 1959 at the Peabody Institute Library in Baltimore called *Calligraphy and Illumination*; followed 2 years later by *Calligraphy and Handwriting in America, 1710–1961*. Filby also became involved in an exhibition on *Two Thousand Years of Calligraphy* held in 1965 at the Walters Art Gallery in Baltimore, which produced a detailed and scholarly catalogue.

Today calligraphy-related activities concentrate themselves mainly around well-known teaching centers (New York; Rhode Island; Chicago; Portland; Oregon; Boston; California), a wide use of fine writing in commerce (much more pronounced and more positive than in Europe), and individual circles where calligraphy is practiced and taught both as an art form and a traditional craft. On the whole, calligraphy is increasingly alive, widely practiced, and appreciated; there are now more groups, more conferences, more exhibitions, and more periodicals produced by influential societies, such as *Alphabet* (for the Friends of Calligraphy, San Francisco), *Calligraphy Idea Exchange* (a quarterly magazine) and *Calligraphy Review*. There are also more courses at art schools or run by private individuals and groups (some of them formal and structured, others less so), more national and international conferences, and a good deal more general awareness of calligraphy than in Europe. One of the reasons lies perhaps in the fact that in the United States there is less divide between calligraphers, artists, designers, and amateurs. After the 1950s, which saw a general regrouping of ideas and resources, an additional stimulus was provided by some prominent calligraphers such as Sheila Waters, David Howells, and (most of all) Donald Jackson taking up teaching appointments at American centers, stimulating workshops and the foundation of new societies, which in turn created a further need for tutors. There has also been an increase in media coverage, a large number of books covering special aspects of calligraphy, and periodicals promoting both an interest in the formal historical scripts while at the same time introducing new trends and new practices to the audience.

Câmara Júnior, Joaquim Mattoso (1904–1970)

E Guimarães, Unicamp, Sao Paulo Campinas, Brazil

© 2006 Elsevier Ltd. All rights reserved.

Mattoso Câmara, Brazilian linguist, is responsible for the introduction of linguistic structuralism in Brazil. He was a graduate in Architecture and Law and began his career in linguistics in the 1930s, taking courses given by George Millardet in Rio de Janeiro. Later on, he went to the United States where he studied under Jakobson. He was a professor of linguistics at the Federal District University, in Rio de Janeiro, from 1937 to 1939. In 1950, he became a professor of general linguistics at the University of Brazil's National College of Philosophy, also in Rio de Janeiro. He was a visiting professor in the United States, Portugal, Mexico and Uruguay (Uchôa, 1972).

Câmara Jr. is the author of the first work on general linguistics published in Brazil (*Princípios de Lingüística Geral* [Origins of General Linguistics, 1941]). Its second edition, revised and enlarged, was published in 1954. In it, Mattoso already shows his formation, marked by the structuralism of the School of Prague (fundamentally Jakobson), Saussure and Sapir. His work covers a wide range of preoccupations: stylistics, phonemics, grammar, the study of indigenous Brazilian languages, and the history of language and general linguistics. In the area of general linguistics, his reflections on the relationship of language and culture are very important. Ever since *Princípios de Lingüística Geral*, he has taken a position according to which the relationship between language and culture is such that language in part of the culture, but a part that can be detached.

Therefore, on the one hand, a language is capable of speaking of the culture itself and, on the other, it signifies the culture of which it is part. It was in this way that, due to his functionalist mentalism, he forever marked the position that the study of language is of interest because it is significant. In the area of general linguistics, he also published the *Dicionário de Fatos Gramaticais* (Dictionary of grammatical facts, 1956), renamed *Dicionário de Filologia e Gramática* (Dictionary of philology and grammar, 1963).

The Portuguese Language

His work describing Portuguese was especially dedicated to phonology and morphology. In the phonological area, aside from an important vision of the conjuncture of the Portuguese phonological system, produced on rigorously structural bases, with an eye to rigor of structural description, Câmara formulated a number of hypotheses that caused discussion. One of them is the nonexistence of nasal vowels in Portuguese. In his opinion, there is a nasal archiphoneme closing the syllable, as in *canto /kaNtu/*.

In his morphological studies, also of a structuralist nature, he presents a rigorous comprehension of the structure of names in Portuguese, but his most interesting contribution regards the morphology of verbs. Aside from his description of the verbal system, he left an indispensable analysis of the so-called irregular Portuguese verbs. According to him, there are other verbal paradigms and not exactly irregularities of the regular paradigms (Câmara, 1969, 1970, 1972, 1975).

In the study of the Portuguese phrase, we can call attention to his description of the functioning of the pronoun *ele*, in colloquial Portuguese, as a verbal complement in Brazilian Portuguese instead of the atonic pronoun *lhe* (Câmara, 1957). In European Portuguese, the pronoun *ele*, as well as *eu*, *tu*, *nós*, *vós* and *eles*, function only as the subject.

The Portuguese language (Câmara, 1972) is perhaps his most complete analytic work on the Portuguese language (Naro, 1976). Initially, it gives an extremely acute presentation of the history of Portuguese and its fixation in Brazil. Following this presentation, the descriptions made by the author during the 1950s and 1960s regarding Portuguese phonology and morphology appear. These are followed by a study of the lexicon and also the Portuguese phrase. Part of this work is published in *Estrutura da língua portuguesa* (Structure of the Portuguese language) (Câmara, 1970), surely the first descriptive (rather than normative) grammar produced in Brazil.

Regarding stylistic studies, he published a specific work (Câmara, 1953a) and produced a large number

The Portuguese Language

His work describing Portuguese was especially dedicated to phonology and morphology. In the phonological area, aside from an important vision of the conjuncture of the Portuguese phonological system, produced on rigorously structural bases, with an eye to rigor of structural description, Câmara formulated a number of hypotheses that caused discussion. One of them is the nonexistence of nasal vowels in Portuguese. In his opinion, there is a nasal archiphoneme closing the syllable, as in *canto /kaNtu/*.

In his morphological studies, also of a structuralist nature, he presents a rigorous comprehension of the structure of names in Portuguese, but his most interesting contribution regards the morphology of verbs. Aside from his description of the verbal system, he left an indispensable analysis of the so-called irregular Portuguese verbs. According to him, there are other verbal paradigms and not exactly irregularities of the regular paradigms (Câmara, 1969, 1970, 1972, 1975).

In the study of the Portuguese phrase, we can call attention to his description of the functioning of the pronoun *ele*, in colloquial Portuguese, as a verbal complement in Brazilian Portuguese instead of the atonic pronoun *lhe* (Câmara, 1957). In European Portuguese, the pronoun *ele*, as well as *eu*, *tu*, *nós*, *vós* and *eles*, function only as the subject.

The Portuguese language (Câmara, 1972) is perhaps his most complete analytic work on the Portuguese language (Naro, 1976). Initially, it gives an extremely acute presentation of the history of Portuguese and its fixation in Brazil. Following this presentation, the descriptions made by the author during the 1950s and 1960s regarding Portuguese phonology and morphology appear. These are followed by a study of the lexicon and also the Portuguese phrase. Part of this work is published in *Estrutura da língua portuguesa* (Structure of the Portuguese language) (Câmara, 1970), surely the first descriptive (rather than normative) grammar produced in Brazil.

Regarding stylistic studies, he published a specific work (Câmara, 1953a) and produced a large number

of articles in his life, notably on one of the most important authors of literature in the Portuguese language, Machado de Assis. These works were later compiled into a book (Câmara, 1962). These stylistic studies had an important impact on his grammatical description of verbs.

The Indigenous Languages and Other Interests

On the study of indigenous languages in Brazil, he published *Introdução às Línguas Indígenas Brasileiras* (Introduction to the indigenous Brazilian languages, 1965). In this work, in addition to producing a vision of the conjunctional problem of studying indigenous languages in Brazil, he brings up interesting discussions on the question of linguistic borrowing. Also, as a professor of the National Museum's Department of Anthropology, in Rio de Janeiro, he was responsible for the presence of linguistics when the postgraduate course in Anthropology was created. In this program, the question of indigenous languages has always been of great importance.

Aside from these aspects, he also dedicated himself to the study of linguistic history, having published an interesting work in this domain (Câmara, 1975b). He was also dedicated to teaching and produced works for this purpose. He was a rigorous and important translator of Sapir's and Jakobson's texts to Portuguese.

Cambodia: Language Situation

G Chigas, University of Massachusetts Lowell, Lowell, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Ninety-five per cent of Cambodia's current population of approximately 12 million speaks Khmer or Cambodian. While the majority of the population is ethnic Khmer, there are substantial numbers of ethnic Vietnamese and Chinese who maintain their respective language and customs in addition to Khmer. There are also various indigenous minorities, such as the Cham (or Khmer-Islam) and Khmer Loeur (Upland Khmer), who speak various dialects of Mon-Khmer languages. Foreign languages such as Sanskrit, Pali, French, Thai, and English have also had a strong influence on Khmer vocabulary and usage.

Literacy

Literacy rates among men and women have varied considerably during the 19th and twentieth centuries. Prior to the establishment of modern public education, reading and writing was primarily taught at temple schools and was generally limited to boys ordained as novice monks. Under the French (1863–1953), the traditional temple-based system was maintained until the early 1900s, when a French-styled system of public education was introduced. By 1925

of articles in his life, notably on one of the most important authors of literature in the Portuguese language, Machado de Assis. These works were later compiled into a book (Câmara, 1962). These stylistic studies had an important impact on his grammatical description of verbs.

The Indigenous Languages and Other Interests

On the study of indigenous languages in Brazil, he published *Introdução às Línguas Indígenas Brasileiras* (Introduction to the indigenous Brazilian languages, 1965). In this work, in addition to producing a vision of the conjunctional problem of studying indigenous languages in Brazil, he brings up interesting discussions on the question of linguistic borrowing. Also, as a professor of the National Museum's Department of Anthropology, in Rio de Janeiro, he was responsible for the presence of linguistics when the postgraduate course in Anthropology was created. In this program, the question of indigenous languages has always been of great importance.

Aside from these aspects, he also dedicated himself to the study of linguistic history, having published an interesting work in this domain (Câmara, 1975b). He was also dedicated to teaching and produced works for this purpose. He was a rigorous and important translator of Sapir's and Jakobson's texts to Portuguese.

Ninety-five per cent of Cambodia's current population of approximately 12 million speaks Khmer or Cambodian. While the majority of the population is ethnic Khmer, there are substantial numbers of ethnic Vietnamese and Chinese who maintain their respective language and customs in addition to Khmer. There are also various indigenous minorities, such as the Cham (or Khmer-Islam) and Khmer Loeur (Upland Khmer), who speak various dialects of Mon-Khmer languages. Foreign languages such as Sanskrit, Pali, French, Thai, and English have also had a strong influence on Khmer vocabulary and usage.

Literacy

Literacy rates among men and women have varied considerably during the 19th and twentieth centuries. Prior to the establishment of modern public education, reading and writing was primarily taught at temple schools and was generally limited to boys ordained as novice monks. Under the French (1863–1953), the traditional temple-based system was maintained until the early 1900s, when a French-styled system of public education was introduced. By 1925

there were about 160 primary schools with 10 000 students. However, enrollment remained relatively small until late in the colonial period. Even by 1944, for example, only 500 out of the approximately 80 000 students enrolled in primary schools went on to the secondary level. After the nation gained independence in 1953, Prince Norodom Sihanouk accelerated Cambodia's educational reforms, and by the late 1960s, Cambodia enjoyed one of the highest literacy rates in Southeast Asia. This rapid progress came to an abrupt halt in the 1970s under the genocidal regime of Pol Pot (1975–1979), when many schools were converted into torture centers and approximately 75% of Cambodia's teachers died of starvation, overwork, or execution. After the 1993 UN-sponsored elections and the end of two decades of civil war, Cambodia's literacy rates began to recover. A recent study by the Cambodian Ministry of Education, Youth, and Sports states that approximately 55% of women and 75% of men are functionally literate.

Foreign Influence

Historically, foreign languages and ideas have had a significant influence on Khmer vocabulary and usage. Contact with the literature and social institutions of India, Thailand, and France and the current widespread use of English have expanded the Khmer lexicon with foreign loanwords, especially for vocational purposes. For centuries prior to the Angkor period (9th to 15th centuries), Indian influence had already led to the use of many Sanskrit loanwords. With the establishment of Hinayana Buddhism in the 15th century, Pali loanwords were added. After the fall of the Angkor Empire, Thai influence increased as Cambodian kings and monks went to live and study in Thailand. From the middle of the 19th century, the use of French for official, education, and recreational purposes rivaled the use of Khmer. However, unlike in Vietnam, the French were never successful at romanizing the Khmer script. To the contrary, after gaining independence in 1953, there was a growing impetus to affirm Cambodian national and cultural identity and a concerted effort was made to expunge French loanwords and replace them with Khmer terms. During the Khmer Rouge period (1975–1979), a new vocabulary, including politicized metaphors, appeared that reflected the regime's radical ideology. Finally, over the last ten years, the influence of English as the language of international business and development has had an impact on Khmer similar to the previous use of French.

Phonology and Grammar

Most Khmer words are monosyllabic or disyllabic, while polysyllabic words are generally neologisms or loanwords from Sanskrit and Pali. Another distinctive feature of Khmer and one that distinguishes it from Thai, Lao, and Vietnamese is the fact that it is non-tonal. There are a total of 33 basic consonants in the Khmer alphabet, comprising two distinct series or registers. The register (whether voiced or voiceless) determines the pronunciation of the vowel that follows. In addition, there are 12 independent vowels, 16 vowel symbols, and 31 subscript consonant symbols, which are used in combination with the basic consonant symbols. Khmer also has 10 diacritical marks that modify the sounds of the dependent and independent symbols. Although Khmer nouns and verbs are not inflected, number and verb tense are indicated by syntax and time markers as needed.

Cameron, Deborah (b. 1958)

B McElhinny, University of Toronto, Toronto, Ontario, Canada

© 2006 Elsevier Ltd. All rights reserved.

Deborah Cameron is Rupert Murdoch Professor of Language and Communication at the University of Oxford. She has degrees from the University of Newcastle upon Tyne (B.A., 1980) and the University of Oxford (M.Litt., 1985). She is a sociolinguist whose work focuses on language, gender, and sexuality; feminist theory; language ideologies; and media language. She is one of the principal scholars to show the implications of feminist theory for linguistics, as well as to demonstrate the contributions that sociolinguistic research can make to interdisciplinary feminist theory and research. Her works in this area include *Feminism and linguistic theory* (1985), *Women in their speech communities: new perspectives on language and sex* (with Coates, J., 1998), *The feminist critique of language: a reader* (ed., 1990), and 'Gender, language, and discourse' (1998).

She is a key contributor to the emerging and rapidly growing body of scholarship on language, sexuality, and desire (see *Language and Sexuality*, with Kulick, D., 2003; and 'Performing gender identity: young men's talk and the construction of heterosexual masculinity,' 1997). She has argued that many sociolinguistic researchers take a 'merely' ethical approach to their research, and has (with Elizabeth Frazer, Penelope Harvey, Ben Rampton, and Kay Richardson) raised questions about, and tried to develop examples of, what sociolinguistic research that is devoted to advocacy for, or even empowerment of, disenfranchised communities might look like in the collaborative book *Researching language: issues of power and method* (1992). In a similar vein, *Verbal hygiene* (1995) takes up a number of case studies that challenge the truism that linguists should, and do, describe rather than prescribe linguistic practices; it received the 1996 Book Award from the British Association of Applied Linguistics.

She has recently begun writing about the implications of globalization for communication in such works as *Good to talk? talk and working in a communication culture* (2000b), *Globalization and language teaching* (ed., with Block, D., 2002), and 'Styling the worker: gender and the commodification of language in the globalized service economy' (2000c). She has also published six other books, including *The lust to kill: a feminist investigation of sexual murder* (with Frazer, E., 1987), and *Working with spoken discourse* (2001).

Professor Cameron's speaking style is funny without being flip, and blunt without being rude. Her writings, even as they lay out complex theoretical insights, are always lucid, in ways consistent with her arguments that if sociolinguists fail to find ways to educate wider audiences in sophisticated ways about language, others will supply more stereotypical, problematic perspectives (see 'A self off the shelf?: consuming women's empowerment,' 2000a). This, in combination with her knack for identifying cutting-edge research questions, makes her widely sought after as a plenary speaker and as a public commentator on sociolinguistic issues.

Cameroon: Language Situation

B Connell, York University, Toronto, Ontario, Canada

© 2006 Elsevier Ltd. All rights reserved.

The Republic of Cameroon has a population of approximately 14.5 million people, speaking almost 300 languages. Like its neighbor Nigeria to the west, it has an extremely complex linguistic setting, with a high ratio of languages relative to overall population, as well as the additional complication of colonial languages and their legacy. In Cameroon this legacy is more complex than elsewhere, as the country has inherited languages from two colonial administrations, British and French, whose policies or attitudes towards indigenous languages were diametrically opposed.

No one indigenous language dominates, as none has a substantially disproportionate number of speakers. Three, however, approach this status: Fula, or Fulfulde, spoken in the northern part of the country, has approximately 668 700 first-language speakers (population figures for individual languages are taken from Grimes, 2000) and functions as a lingua franca in that region, with up to 5 000 000 others using it as a second language, though there is substantial dialect variation. Ewondo has 577 700 speakers and serves as a lingua franca in the central region; its status is bolstered as a result of being the language of the capital, Yaoundé. Duala, despite a relatively low number of first-language speakers (87 700), is a lingua franca in the western region, due largely to its status as the language of Douala, the financial heart of Cameroon.

In addition to these, Cameroon Pidgin English (sometimes referred to as 'Wes Cos') is spoken predominantly as a second language by approximately 2 000 000 people in the South West and North West provinces (*see* **Pidgins and Creoles: Overview**). Its use ranges far beyond these areas, however, and in practice it is the most widely used lingua franca in Cameroon. It should be added that Cameroon Pidgin English is not the only pidgin spoken in country; Ewondo Populaire is a pidginized version of Ewondo spoken around Yaoundé, and the variety of Fulfulde used as a second language is also arguably pidginized. Of all Cameroonian languages, Fulfulde is the largest in terms of first-language speakers and only a few others boast more than 100 000 speakers. The average number of speakers per language is 51 000, and as many as 31 languages are listed (Connell, in press) as having fewer than 1000 speakers.

Cameroon has a complex colonial history, with the French dominating the bulk of the country, but first the Germans and then the British controlling the western region. It was only in 1961 that the former British Cameroon decided by referendum to leave the newly independent Nigeria to join French Cameroon. This mottled history has had a significant impact on the linguistic situation in the country. Following the tradition of the French, little or no importance has been attached by the government to the use of indigenous languages in education, and to date there is no official policy in this respect. Attitudes among the people, however, do seem to vary somewhat between the so-called francophone and anglophone zones. In the former British colony there is greater importance attached to mother tongue education, and although it is still not to be found in state schools, there is a greater tendency for private schools (typically, but not only, mission schools) to offer at least the first years of primary education in the language of the community. An increasing tendency, particularly in the anglophone zone of the southwest, is the use of pidgin in primary education, although this practice is not at present recognized by the government.

Only French and English are acknowledged as official languages, and the use of two colonial languages as official languages has led to intergroup conflict. As has happened elsewhere (Canada, Belgium), a minority language group has perceived itself as being discriminated against, and in Cameroon those who are of the English zone claim difficulty in obtaining civil service employment where, despite the policy of two official languages, the language of the workplace is French.

Despite the lack of official policy or status regarding indigenous languages, a certain degree of attention has been devoted to their documentation and development. The *Atlas Linguistique du Cameroun* was undertaken as part of a larger effort, the *Atlas Linguistique d'Afrique Centrale* (1983), sponsored in part by the French government and in part by Cameroonian government agencies. In addition to this, a standardized orthography has been developed suitable for the writing of all Cameroonian languages.

The great number of languages found in Cameroon, their substantial diversity, the low average number of speakers, and the high number of languages with fewer than 1000 speakers, has important implications for linguistic studies. At a very basic level, most of these languages remain only partially described at best, and considerable work of importance remains to be done to rectify this situation. There is a very real threat that, in the face of globalization and modernization, many of these languages will disappear in the near future before they can be documented. The implications of the linguistic diversity found in

Cameroon, and particularly the Nigeria-Cameroon borderland, are of great interest for historical studies, both of a linguistic and general nature. This region is now generally accepted by historical linguists as being the ultimate homeland of the Bantu languages (*see* **Bantu Languages**), as it is here where the older relatives of Bantu, Bantoid language groups such as Mambiloid, and the apparent isolates Dakoid and Fam are found. The considerable amount of work to be done on these from the historical and ethnological perspective will eventually reveal much about the prehistory of the peoples of West and Central Africa.

Campanella, Thomas (1568–1639)

C Massai

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume, pp. 442–443, © 1994, Elsevier Ltd.

Campanella was one of the most important philosophers of the Italian Renaissance. Besides theology, poetry, and astrology, his interests also included linguistics. He was the author of a Latin *Grammar*, and several of his works discuss language reforms of both an orthographical and semantic nature.

Campanella was born on September 5, 1568 at Stilo in Calabria. While still very young he entered the Dominican order, but irked by the discipline in 1589 fled the monastery for Naples, Rome, Florence, and Padua, where he studied at the University. In 1599 he returned to Calabria, where he was involved in a plot against the Spanish. The plot was discovered and Campanella passed the next 27 years in prison. A late summons to the French court, due to his fame as an astrologer, brought him the tranquillity he had never known and enabled him to dedicate himself to the revision and publication of works written in prison. He died in Paris on May 21, 1639.

The most important of Campanella's writings to deal with linguistics are his *Poetica* (Italian edition, 1596, Latin, 1612) and the *Grammatica* (1618, but published with *Poetica* in 1638; see Firpo, 1940). The latter is somewhat traditional in outlook, similar to the grammars of the Modistae. Indeed, according to Padley (1976), "Campanella's work forms an important part of . . . Scholastic reaction." However, other features of the *Grammatica* are typical of its day, such as its interest in the creation of a philosophical language. Campanella outlines its theoretical basis in the last pages of the grammar, the *Appendix de philosophicae linguae institutione*. The new language, he states, must be clear and unambiguous, reflecting an absolute correspondence between words and things. Similarly, its orthography should show a marked relation between sounds and letters. In the *Grammatica*, but still more so in the *Poetica*, Campanella suggests that letters should be represented as they are articulated (e.g.,) (representing lip closure for *b*, etc.) (*see* **Phonetic Transcription: History**).

Campanella's theories were to play an important role in 17th-century debates on the subject of artificial language, and considerably influenced the work of J. Wilkins, who in his *Essay* of 1668 cites him among his sources (*see* **Wilkins, John (1614–1672)**).

Campe, Joachim Heinrich (1746–1818)

K R Jankowsky, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Joachim Heinrich Campe, born in 1746 in Deensen near Holzminden, Germany, studied Protestant theology and philosophy at the universities of Helmstedt and Halle. After graduating in 1769, he spent four years as private tutor in the house of Alexander Georg von Humboldt in Berlin, then two years as military chaplain in Potsdam, only to return in 1775 to the Berlin-Tegel castle of the Humboldts, this time as educator of the two sons, Wilhelm (b. 1767) and Alexander (b. 1769). Wilhelm von Humboldt later reminisced on this, for him, unforgettable period of his life: "[Campe] showed even then a most appropriate, natural gift of vividly stimulating a child's intellect" (cf. Hallier, 1862: 17; transl. by K. R. Jankowsky). Rousseau's new theory of education, advanced in his monumental 4-volume *Emile, ou De l'éducation* (published 1762) significantly strengthened Campe's interest in pedagogy. He welcomed his appointment in 1776 by Count Franz von Dessau to the board of directors of the Dessau Philanthropin, a prestigious educational institution, founded in 1772 and directed by Johann Bernhard Basedow (1723–1790). After a few months, he succeeded Basedow as the Philanthropin's director but resigned the following year, due to irreconcilable differences with the institution's founder. From then on he devoted most of his time to writing.

Campe gained widespread recognition among his contemporaries and for a long time thereafter in three major areas:

1. He produced a substantial number of highly influential educational writings, most prominent among them his *Robinson der Jüngere: Zur angenehmen und nützlichen Unterhaltung für Kinder* (Campe, 1779–1780), based on Daniel Defoe's *Robinson Crusoe,* translated in numerous languages, which saw 90 editions within about 100 years. Of comparable importance as an educational tool was his *Kleine Kinderbibliothek* (Campe, 1790a), originally comprising more than 20 volumes and likewise translated in several languages. By 1815, it had gone through 11 editions of varying size.
2. Campe believed in the need for 'purifying' the German (German, Standard) language of non-German ingredients. He tried to achieve this objective by theoretical discussions as well as practical illustrations (cf., e.g., Campe, 1790b, 1794, 1804). Of his approximately 11 000 newly coined German words, about 3000 were there to stay, not necessarily as replacements, but certainly as well-liked variants of their foreign originals. They include 'Hochschule' for 'Universität' (university), 'Einzahl, Mehrzahl' for 'Singular, Plural' (singular, plural), 'Stelldichein' for 'Rendezvous' (rendezvous), 'Feingefühl' for 'Delikatesse' (tact, delecacy). But the majority – like 'Zitterweh' for 'Fieber' (fever), 'Geistesanbau' for 'Kultur' (culture), 'Haarkräusler' for 'Friseur' (hairdresser) – was short-lived, their demise being quickened by ironic, even sarcastic criticism from highly placed sources (cf., e.g., *Xenien* by Goethe and Schiller).
3. Tied to his 'purification campaign' was his effort to present to native speakers the richness of their mother tongue by compiling a comprehensive *Wörterbuch der Deutschen Sprache*. The first fruit of his labors was the 2-volume supplement of 1801 to Adelung's *Wörterbuch der hochdeutschen Mundart* (1774–1786). But his own *Wörterbuch* goes well beyond that of Adelung. He aims at the entire *Deutsche Sprache*, not restictively at the *hochdeutsche Mundart* only. And whereas Adelung lists just ca. 55 000 words, Campe's dictionary comprises almost three times that amount. Even though he counts derivations as separate entries, the advancement is still considerable.

Campe's significance for historical linguistics is still being examined. Publications like Orgeldinger (1999) and the exhibition at the Wolfenbüttel Library as documented in Schmitt (1996) provided just a glimpse of proof that the discussion is far from being over.

Campe, Joachim Heinrich (1746–1818)

K R Jankowsky, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Joachim Heinrich Campe, born in 1746 in Deensen near Holzminden, Germany, studied Protestant theology and philosophy at the universities of Helmstedt and Halle. After graduating in 1769, he spent four years as private tutor in the house of Alexander Georg von Humboldt in Berlin, then two years as military chaplain in Potsdam, only to return in 1775 to the Berlin-Tegel castle of the Humboldts, this time as educator of the two sons, Wilhelm (b. 1767) and Alexander (b. 1769). Wilhelm von Humboldt later reminisced on this, for him, unforgettable period of his life: "[Campe] showed even then a most appropriate, natural gift of vividly stimulating a child's intellect" (cf. Hallier, 1862: 17; transl. by K. R. Jankowsky). Rousseau's new theory of education, advanced in his monumental 4-volume *Emile, ou De l'éducation* (published 1762) significantly strengthened Campe's interest in pedagogy. He welcomed his appointment in 1776 by Count Franz von Dessau to the board of directors of the Dessau Philanthropin, a prestigious educational institution, founded in 1772 and directed by Johann Bernhard Basedow (1723–1790). After a few months, he succeeded Basedow as the Philanthropin's director but resigned the following year, due to irreconcilable differences with the institution's founder. From then on he devoted most of his time to writing.

Campe gained widespread recognition among his contemporaries and for a long time thereafter in three major areas:

1. He produced a substantial number of highly influential educational writings, most prominent among them his *Robinson der Jüngere: Zur angenehmen und nützlichen Unterhaltung für Kinder* (Campe, 1779–1780), based on Daniel Defoe's *Robinson Crusoe,* translated in numerous languages, which saw 90 editions within about 100 years. Of comparable importance as an educational tool was his *Kleine Kinderbibliothek* (Campe, 1790a), originally comprising more than 20 volumes and likewise translated in several languages. By 1815, it had gone through 11 editions of varying size.
2. Campe believed in the need for 'purifying' the German (German, Standard) language of non-German ingredients. He tried to achieve this objective by theoretical discussions as well as practical illustrations (cf., e.g., Campe, 1790b, 1794, 1804). Of his approximately 11 000 newly coined German words, about 3000 were there to stay, not necessarily as replacements, but certainly as well-liked variants of their foreign originals. They include 'Hochschule' for 'Universität' (university), 'Einzahl, Mehrzahl' for 'Singular, Plural' (singular, plural), 'Stelldichein' for 'Rendezvous' (rendezvous), 'Feingefühl' for 'Delikatesse' (tact, delecacy). But the majority – like 'Zitterweh' for 'Fieber' (fever), 'Geistesanbau' for 'Kultur' (culture), 'Haarkräusler' for 'Friseur' (hairdresser) – was short-lived, their demise being quickened by ironic, even sarcastic criticism from highly placed sources (cf., e.g., *Xenien* by Goethe and Schiller).
3. Tied to his 'purification campaign' was his effort to present to native speakers the richness of their mother tongue by compiling a comprehensive *Wörterbuch der Deutschen Sprache*. The first fruit of his labors was the 2-volume supplement of 1801 to Adelung's *Wörterbuch der hochdeutschen Mundart* (1774–1786). But his own *Wörterbuch* goes well beyond that of Adelung. Canada: Language Situation

G J Rowicka, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Canada has a multilingual population of 29.6 million. Since passage of the Official Languages Act in 1969, it has two official languages on the federal level: English and French. However, only 23% of the Canadian population, predominantly inhabitants of Quebec, speak French as their sole or principal language, versus 68% who mainly speak English. English-French bilingualism is not very widespread (17% of the population), but it is increasing. The issue of reconciling Quebec's francophones with the majority anglophone Canadian population seems to have been moved to the back burner since the Quebec government's referendum on independence failed to pass in October 1995.

Canadian English resembles American English in many ways. Like Americans, but unlike speakers of (Southern) British English, Canadians pronounce [r] in *car* and *farm*. Yet Canadian English also has some characteristics of its own in its vocabulary, spelling, pronunciation, and grammar, some of which are seen as 'Britishisms.' Many Canadians still use *serviettes* at the table, rather than *napkins*, as Americans do. They apologize by saying *sorry* [sori], rather than [sari]. Typical is 'Canadian Raising', which makes the vowels [aw] in *house* and [ay] in *knife* (before voiceless consonants) sound quite different – 'higher' – than the vowel in *houses* and *knives* (before voiced consonants). A well-known Canadian trait is *eh*, as in *You like it, eh?*, where Americans would rather use *huh*. There are, however, regional and social differences in these and other features.

Canadian French also differs from European French. It developed out of 17th century French and other languages spoken in France at that time and has preserved some archaic features long since lost in European French. For instance, Quebec French has a distinction between long and short vowels, such as *fête* 'anniversary' [fɛ:t] and *faite* 'done, FEM' [fɛt], while most European French dialects have only short vowels. In several French varieties, word-final consonant clusters can be simplified, for instance, *table* [tab] 'table'. In Quebec French, however, more complex groups are also simplified, as in *astre* [as] 'aster', even in formal contexts. Some words have a different meaning in Quebec and in European French.

Canada has a multilingual population of 29.6 million. Since passage of the Official Languages Act in 1969, it has two official languages on the federal level: English and French. However, only 23% of the Canadian population, predominantly inhabitants of Quebec, speak French as their sole or principal language, versus 68% who mainly speak English. English-French bilingualism is not very widespread (17% of the population), but it is increasing. The issue of reconciling Quebec's francophones with the majority anglophone Canadian population seems to have been moved to the back burner since the Quebec government's referendum on independence failed to pass in October 1995.

Canadian English resembles American English in many ways. Like Americans, but unlike speakers of (Southern) British English, Canadians pronounce [r] in *car* and *farm*. Yet Canadian English also has some characteristics of its own in its vocabulary, spelling, pronunciation, and grammar, some of which are seen as 'Britishisms.' Many Canadians still use *serviettes* at the table, rather than *napkins*, as Americans do. They apologize by saying *sorry* [sori], rather than [sari]. Typical is 'Canadian Raising', which makes the vowels [aw] in *house* and [ay] in *knife* (before voiceless consonants) sound quite different – 'higher' – than the vowel in *houses* and *knives* (before voiced consonants). A well-known Canadian trait is *eh*, as in *You like it, eh?*, where Americans would rather use *huh*. There are, however, regional and social differences in these and other features.

Canadian French also differs from European French. It developed out of 17th century French and other languages spoken in France at that time and has preserved some archaic features long since lost in European French. For instance, Quebec French has a distinction between long and short vowels, such as *fête* 'anniversary' [fɛ:t] and *faite* 'done, FEM' [fɛt], while most European French dialects have only short vowels. In several French varieties, word-final consonant clusters can be simplified, for instance, *table* [tab] 'table'. In Quebec French, however, more complex groups are also simplified, as in *astre* [as] 'aster', even in formal contexts. Some words have a different meaning in Quebec and in European French.

The other main variety of Canadian French is Acadian, which is spoken along the Atlantic coast. Cajun, the French dialect of Louisiana, United States, derives from Acadian.

Canada's linguistic wealth extends far beyond the two largest languages. About 17% of all Canadians speak a language other than English or French as their mother tongue. These are Aboriginal Canadian languages or immigrant languages. According to the 2001 Census, only 21 languages indigenous to Canada are still spoken (although other sources still mention 50). They can be grouped into several language families. Most linguistic diversity is concentrated in the west of the country.

The majority of Aboriginal language families are as distinct from each other as, for instance, Indo-European is from Sino-Tibetan. They exhibit remarkable structural diversity and characteristics unlike those familiar from Indo-European languages. For instance, in Nuxalk (Bella Coola, a Salish language) there are words without a single vowel, e.g., *sk*^{w}*χ' ɬ*$_{p}$ 'seed'. A property of most Aboriginal languages is polysynthesis. Words in polysynthetic languages can contain a large number of meaningful parts (morphemes). For instance, in Mohawk (an Iroquoian language the following is a single word:

s-a-hʉwa-nho-tʉ-kw-ahs-eʔ
again-PAST-she/him-door-close-un-for-PERF
'she opened the door for him again'

Numerous Aboriginal words have been adopted into Canadian English. The country's name, Canada, comes from the Laurentian (extinct Iroquoian language) word for 'settlement'.

In the Northwest Territories, since 1993 several Aboriginal languages have enjoyed an official status equal to that of English and French. Inuktitut (the language of the Inuit) also has official status in Nunavut, a Canadian territory that was part of the Northwest Territories until 1999 and where 80% of the population are Inuit. However, most Aboriginal languages are seriously endangered as a result of, among others, repressive education policies practiced in the past and are only spoken fluently by the oldest generation. Only Cree (80 000 speakers), Ojibwa (45 000 speakers), and Inuktitut (20 000 speakers) are estimated to have good chances of long-term survival. There is a growing involvement of universities in language preservation efforts.

Among the Aboriginal Canadian languages on the verge of extinction is Michif, a unique mixed language of Canada's Métis, most of whom are descendants from Cree or Ojibwa women and French Canadian fur trappers. Michif combines Cree verbs and French nouns. French noun phrases retain lexical gender and adjective agreement, while Cree and Ojibwa verbs retain much of their polysynthetic structure. This makes Michif unlike other contact languages, which usually exhibit simplified grammar.

Among new (immigrant) Canadian languages, Chinese, Italian, and German are each spoken by more than 400 000 people, with Chinese speakers constituting the largest linguistic group in Canada after English and French. Seven other languages (Spanish, Portuguese, Polish, Panjabi, Ukrainian, Arabic, and Tagalog) have between 150 000 and 228 000 speakers each. In some cities there are such large ethnic populations that it is possible to live, work, and shop there without using any of the official languages. In Toronto, 40% of the population speak a mother tongue that is neither English nor French. In Vancouver this figure is 27%, in Winnipeg 21%, and in Montréal 17%.

The strength of nonofficial languages is part of a deliberate policy on the part of the Canadian government.

> It is precisely the rejection of uniformity, the refusal to accept a homogeneous view of themselves and their country, that constitutes the most authentic and widely shared experience of Canadians. The affirmation and preservation of differences, personal, social, local, regional, cultural, linguistic, has consumed the minds and hearts of Canadians all through their history. It is the Canadian response to the question of identity. Our unity – and it is a real and profound unity if we will only bring ourselves to see it—arises from the determination to preserve the identity of each of us. – From *A national understanding* (government report, 1977)

Canadian Lexicography

K Barber, Oxford University Press, Toronto, Ontario

© 2006 Elsevier Ltd. All rights reserved.

Dictionaries used in English-speaking Canada have all too often been reprints of British or American works, with little or no revision. It was not until the late 1950s that Canadians began to seriously research the history of Canadian English and words that originated in Canada, that have meanings peculiar to Canada, or that have special significance in Canada. This resulted in the publication of the *Dictionary of Canadianisms on historical principles* in 1967, on which the Canadian content in dictionaries, chiefly those published by Gage, was based for the next 25 years. Dictionaries of regional varieties of Canadian English, such as the *Dictionary of Newfoundland English* (1982) and the *Dictionary of Prince Edward Island English* (1988), expanded on the coverage provided by the *Dictionary of Canadianisms*.

In 1992, Oxford University Press Canada established a permanent dictionary department in Toronto, with the aim of producing a thoroughly researched dictionary of current Canadian English based on corpus analysis and a vast reading program. The first edition of the *Canadian Oxford dictionary* appeared in 1998, followed by a number of spin-offs and a second edition in 2004. This project also provides Canadian quotations to the OED.

Like Anglophone Canadians, Francophones in Canada have long had to make do with dictionaries reflecting a linguistic reality different from their own, a phenomenon compounded by the European French trend toward marginalizing varieties of the language found outside of France. There has been an ongoing tension in Québécois dictionaries between attempts to align Québécois French with the standards of France on the one hand and the desire to assert and legitimate usages particular to Quebec on the other. In the late 1980s, the first serious dictionaries of Canadian French began to appear, based upon the belief that French–Canadian (both Québécois and Acadian) usages are both valid and standard rather than marginal compared with the French spoken in France. These dictionaries, such as the *Dictionnaire du français plus à l'usage des francophones d'Amérique* (1988), the *Dictionnaire des canadianismes* (1989), and the *Dictionnaire québécois d'aujourd'hui* (1992), drew on the vast research compiled by the Université Laval, which published its own historical dictionary of Canadian French, the *Dictionnaire du français québécois*, in 1998. A small French–English dictionary was first published in Canada in 1962. Researchers at the University of Ottawa, the Université de Montréal, and the Université Laval have been collaborating on a Canadian French–English dictionary since 1988.

A number of dictionaries of Canadian Aboriginal languages also exist, and more are in preparation. This work was started by missionaries in the 19th century and was taken up more recently by the Canadian Museum of Civilization, which has produced bilingual dictionaries of Western Abenaki, Heiltsuk, Kwakwala (Kwakiutl), Mohawk, and Mi'kmaq (Micmac).

The Canary Islands are a group of seven main islands about 100 km off the African coast opposite Morocco and Western Sahara. They are an autonomous region of Spain.

The islands have been inhabited since at least 200 B.C., and they were mentioned in classical sources. However, there is no further evidence of European knowledge of them until the 13th century, when they were 're-discovered' by a Genovese fleet. At that time, the people living on the islands were speakers of Guanche, most probably a Berber language. However, the only traces of the language are a few place names, as their speakers had been converted to Christianity, and to Castilian Spanish, by the end of the 15th century, when the islands became part of Castile. Spanish is the official language of the

Canary Islands today. During the 19th and early 20th centuries, a mixed Spanish-English trade variety called Pichingli was used on the islands (Armistead, 1995). In the 20th century, the Canary Islands developed a major tourist industry, and there is now at any one time a substantive contingent of more or less short-term visitors, who are catered to with mainly English and German print media, shop signs, menus, and so forth.

In addition to spoken language, the Canary island of La Gomera is home to the 'whistling language' Silbo Gomero (from Spanish *silbar*, 'whistle'). The language is said to have been used as a means of long-distance communication on the mountainous island since before the arrival of the Spanish, but knowledge of it decreased with the advent of modern communication. Seen as a part of the island's cultural heritage, Silbo Gomero is now taught in schools on the island.

Cape Verde Islands: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

The Republic of Cape Verde consists of 10 islands and five islets off the west coast of Africa, about 600 km west of Senegal. The islands were uninhabited until the 15th century, when they were colonized by the Portuguese, who used them as a supply and trading post for the slave trade. Many speakers of African (mainly West-Atlantic) languages were brought from the then-Portuguese territory of Guinea-Bissau. Cape Verde became independent in 1975.

The official language of Cape Verde is Portuguese. However, the majority of the 415 000 (July 2004 estimate) residents of the islands speak the Portuguese-based Cape Verdean creole Kabuverdianu (Crioulo/Kriolu) as their first language. Kabuverdianu falls into two main dialect groups, Sotavento and Barlavento. The former is spoken on the southern (Sotavento) islands, which include São Tiago, with the capital, Praia, and site of the earliest settlements. Sotavento is spoken by about 65% of Kabuverdianu speakers. The dialect of the northern Barlavento islands, which were settled only in the late 17th and 18th centuries, is spoken by the remaining 35% of speakers.

Since independence, the role and status of Kabuverdianu have increased, and the language is used in domains previously reserved for Portuguese, e.g., formal religious and political discourse. Portuguese is used on television and radio, as well as in education, where it is the primary language of instruction throughout all levels.

Because of harsh economic conditions and high unemployment, many Cape Verdeans have left the islands and work abroad, so the majority of speakers of Kabuverdianu (about 934 000) do not live in Cape Verde. There are large Kabuverdianu communities in Guinea Bissau, Senegal, several western European countries, and the United States.

Canary Islands today. During the 19th and early 20th centuries, a mixed Spanish-English trade variety called Pichingli was used on the islands (Armistead, 1995). In the 20th century, the Canary Islands developed a major tourist industry, and there is now at any one time a substantive contingent of more or less short-term visitors, who are catered to with mainly English and German print media, shop signs, menus, and so forth.

In addition to spoken language, the Canary island of La Gomera is home to the 'whistling language' Silbo Gomero (from Spanish *silbar*, 'whistle'). The language is said to have been used as a means of long-distance communication on the mountainous island since before the arrival of the Spanish, but knowledge of it decreased with the advent of modern communication. Seen as a part of the island's cultural heritage, Silbo Gomero is now taught in schools on the island.

Cape Verde Islands: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

The Republic of Cape Verde consists of 10 islands and five islets off the west coast of Africa, about 600 km west of Senegal. The islands were uninhabited until the 15th century, when they were colonized by the Portuguese, who used them as a supply and trading post for the slave trade. Many speakers of African (mainly West-Atlantic) languages were brought from the then-Portuguese territory of Guinea-Bissau. Cape Verde became independent in 1975.

The official language of Cape Verde is Portuguese. However, the majority of the 415 000 (July 2004 estimate) residents of the islands speak the Portuguese-based Cape Verdean creole Kabuverdianu (Crioulo/Kriolu) as their first language. Kabuverdianu falls into two main dialect groups, Sotavento and Barlavento. The former is spoken on the southern (Sotavento) islands, which include São Tiago, with the capital, Praia, and site of the earliest settlements. Sotavento is spoken by about 65% of Kabuverdianu speakers. The dialect of the northern Barlavento islands, which were settled only in the late 17th and 18th centuries, is spoken by the remaining 35% of speakers.

Since independence, the role and status of Kabuverdianu have increased, and the language is used in domains previously reserved for Portuguese, e.g., formal religious and political discourse. Portuguese is used on television and radio, as well as in education, where it is the primary language of instruction throughout all levels.

Because of harsh economic conditions and high unemployment, many Cape Verdeans have left the islands and work abroad, so the majority of speakers of Kabuverdianu (about 934 000) do not live in Cape Verde. There are large Kabuverdianu communities in Guinea Bissau, Senegal, several western European countries, and the United States.

Cape Verdean Creole

M Baptista, University of Georgia, Athens, GA, USA

© 2006 Elsevier Ltd. All rights reserved.

Cape Verdean Creole (henceforth CVC) is spoken in Cape Verde Islands, an archipelago located in the Atlantic Ocean off the northwestern coast of Africa, at approximately 450 kilometers from Senegal. The archipelago is divided into two main clusters: the windward islands (locally known as Barlavento) and the leeward islands (Sotavento). Barlavento includes Boavista, Sal, São Nicolau, Santa Luzia, São Vicente, and Santo Antão. Sotavento consists of Brava, Fogo, Santiago, and Maio.

Given the strategic location of the archipelago at the crossroads of Europe, Africa, and America, the Portuguese settled the islands from 1462 onward, and the islands came to play a critical role in the slave trade from the 15th to the 19th centuries. As a result, many view CVC as the oldest creole alive today. Historical sources (Brásio, 1962) state that the tribes of Mandingues, Balantes, Bijagos, Feloupes, Beafadas, Pepels, Quissis, Brames, Banhuns, Peuls, Jalofos, Bambaras, Bololas, and Manjakus provided most of the human contingent to the slave trade in Cape Verde. The white settlers came from Algarve and Alentejo in Portugal and also included Jews, Spaniards, Italians, and French (Martinus, 1996). Having been settled at different times with different populations, it is not surprising that a number of morphophonological and syntactic features distinguish Barlavento varieties (closer to Portuguese) from their Sotavento counterparts (more Africanized), resulting in a fairly complex sociolinguistic situation.

Although earlier descriptions of the language viewed CVC as a mere dialect of Portuguese, recent studies have shed new light on the hybrid nature of CVC focusing on the African contributions to the formation of the language. Baptista (2003a) studied specifically reduplication, a morphological process found in African languages whereby a reduplicated adjective or adverb expresses emphasis, as in *moku moku* 'very drunk' or *faxi faxi* 'very quickly'. Noun reduplication may yield a distributive interpretation, as in *dia dia* 'every day' or may simply lead to a change in meaning, as in *boka* 'mouth,' *boka boka* signifying 'in secret'. Lexical categories such as adjectives once reduplicated may shift category (i.e., adjective to noun) as in *mansu* 'quiet', *mansu mansu* 'secrecy'. Other scholars such as Rougé (2004) and Quint (2000) have examined the possible African etymology of some of the Cape Verdean linguistic items that have found their way in the grammatical and lexical components of the language. Lang (2004) has investigated how some grammatical morphemes inherited from Portuguese may also take on new functions passed down from substrates like Wolof. In a similar vein of work, Baptista (2003b) has examined how the plural suffix-*s* in Cape Verdean inherited from Portuguese is sensitive to conditions such as the animacy hierarchy and definiteness, two variables playing a role in the African languages having contributed to the genesis of CVC.

Such studies demonstrate the genuine hybrid nature of CVC by examining how various elements from all source languages involved in its genesis interact and at what level. This gives us valuable insights into cognitive processes at play when languages come abruptly into contact.

Cariban Languages

S Meira, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The Cariban family is one of the largest genetic groups in South America, with more than 25 languages (see Figure 1) spoken mostly north of the Amazon, from Colombia to the Guianas and from northern Venezuela to Central Brazil (see Figure 2). Despite the long history of their studies, most Cariban languages are still insufficiently described. The best descriptive works published so far are Hoff (1968, on Karinya) and Derbyshire (1979, 1985, on Hishkaryana). There are good descriptive works on Apalai, Makushi, and Waiwai in Derbyshire and Pullum (1986–1998); Jackson (1972) gives a brief, but detailed, overview of Wayana. Muller (1994) is a very informative Panare dictionary. Meira (2005) and Carlin (2004) are full descriptions of Tiriyo; Meira (2000), mostly a historical study, contains some descriptive work on Tiriyo, Akuriyo, and Karihona. Gildea (1998) and Derbyshire (1999) contain surveys of the family.

Comparative Studies and Classification

First recognized by the Jesuit priest Filippo Salvadore Gilij in the 18th century (Gilij, 1780–1783), the Cariban family was subsequently studied by L. Adam (1893) and C. H. de Goeje (1909, 1946). After some initial tentative proposals within larger South

Figure 1 A tentative classification of Cariban languages. (?) = difficult to classify; (†) = extinct (not all listed here). Different names or spellings for the same language are given in parentheses. Dialects are indented under the language name. (Demogropahic data refer to speakers, not ethnic members of the group; sources: Ethnologue and author's own work).

American classifications (the last of which is Loukotka, 1968), the first detailed classification was published by V. Girard (1971), followed by M. Durbin (1977) and T. Kaufman (1994). Durbin's classification – unfortunately used in the Ethnologue (SIL) – is, as Gildea (1998) pointed out, seriously flawed; Girard's classification is limited (14 low-level subgroups); Kafuman's classification is probably the best; it is based not on firsthand sources but on the comparison of other classifications. The proposal in Figure 1 is the preliminary result of ongoing comparative research. There is some good evidence that Cariban and Tupian languages are distantly related (Rodrigues, 1985); other hypotheses (e.g., Ge-Pano-Carib and Macro-Carib, from Greenberg, 1987) remain mostly unsupported and are not accepted by specialists.

Shafer (1963) was the first attempt at reconstructing Proto-Cariban phonology, but its many flaws make Girard (1971) the real first proposal in this area. The most up-to-date study is Meira and Franchetto (2005). Meira (2000) reconstructs the phonology and morphology of the intermediate proto-language of the Taranoan subgroup.

Main Linguistic Features

Phonology

Cariban languages have small segmental inventories: usually only voiceless stops (*p*, *t*, *k*, *ʔ*), one or two fricatives/affricates (*h* or *Φ*, *s* or *ʃ* or *tʃ*), two nasals (*m*, *n*), a vibrant (*ɾ*, often *ɹ* or *ɽ*), glides (*w*, *j*), and six vowels (*a*, *e*, *i*, *o*, *u*, *ɨ*). Some languages have distinctive voiced obstruents (Bakairi, Ikpeng, Karihona), more than one vibrant or lateral (Bakairi, Kuikuro, Ikpeng, Hishkaryana, Waiwai, Kashuyana), or more fricatives or affricates (Bakairi, Waimiri-Atroari, Kashuyana, Waiwai); others have an extra vowel *ə* (Wayana, Tiriyo, Panare, Bakairi, Pemong, Kapong). Vowel length is often distinctive, whereas nasality usually is not, with few exceptions (Apalai, Bakairi, Kuikuro). Many languages have weight-sensitive

Figure 2 Map of the current distribution of Cariban languages. Living languages in bold, extinct languages in normal type. **AK**, Akuriyo; **Ar**, Arara; **Bk**, Bakairi; Ch, Chayma†; **Dk**, De′kwana; **Hk**, Hishkaryana; **Ik**, Ilkpeng; **Ka**, Karinya; **Kh**, Karihona; **Kk**, Kuikuro; **Km**, Kumanakoto†; **Kp**, Kapong; **Ks**, Kashuyana; **Mk**, Makushi; **Mp**, Mapoyo; **Pe**, Pemong; Pi, Pimenteria†; Pm Palmella†; **Pn**, Panare; **Ti**, Tiriyo; Tm, Tamanaku; **Yu**, Yukpa; **Yw**, Yawarana; **Wm**, Waimiri-Atroari; **Ww**, Waiwai; **Wy**, Wayana.

rhythmic (iambic) stress (Table 1; Meira, 1998); some, however, have simple cumulative, usually penultimate, stress (Panare, Bakairi, Kuikuro, Yukpa). Morphophonological phenomena include stem-initial ablaut in verbs and nouns and the systematic reduction of stem-final syllables within paradigms (Gildea, 1995; Meira, 1999).

Morphology

Cariban languages are mostly suffixal; prefixes exist also, marking person and valency (the latter on verbs). Some languages (Tiriyo, Wayana, Apalai) have reduplication. The complexity of the morphology is comparable to that of Romance languages. There are usually nouns, verbs, postpositions, adverbs (a class that includes most adjectival notions), and particles.

Possessed nouns take possession-marking suffixes that define subclasses (*-ri*, *-ti*, *-ni*, *-Ø*) and person-marking prefixes that indicate the possessor (e.g., Ikpeng *o-megum-rɨ* 'your wrist', *o-muj-n* 'your boat,' *o-egɨ-Ø* 'your pet'). With overt nominal possessors, some languages have a linking morpheme *j-* (e.g., Panare *Toman j-uwəʔ* 'Tom's house, place'). Nouns can also be marked for past ('ex-N,' 'no longer N') with special suffixes (*-tpo*, *-tpɨ*, *-bɨ*, *-tpə*, *-hpə*, *-npə*, etc.; e.g., Bakairi *ũwɨ̃-bɨ-rɨ* 'my late father'). Pronouns distinguish five persons (1, 2, 3, 1 + 2 = dual inclusive = 'you and I,' 1 + 3 = exclusive; the 1 + 3 pronoun functions syntactically as a third-person form) and two numbers (singular, or noncollective, and plural, or collective). The third-person forms also have gender (animate vs. inanimate) and several deictic distinctions (Table 2). To each pronoun usually corresponds a person-marking prefix (except 1 + 3, to which correspond simple third-person markers). In some languages, the 1 + 2 prefixes were lost (Kapong, Pemong, Makushi); in others, the prefixes are replaced by pronouns as overt possessors (Yukpa, Waimiri-Atroari).

In more conservative languages, verbs have a complex inflectional system, with prefixes marking person and suffixes marking various tense-aspect-mood and number distinctions. The person-marking prefixes form what Gildea termed the *Set I* system (Table 3), variously analyzed as split-S or active-stative (e.g., by Gildea) or as cross-referencing both A (Agent) and P (Patient) (Hoff, 1968). In most languages, however, innovative systems have arisen from the reanalysis of older deverbal nominalizations or participials, and are now in competition with the Set I system. Most of the new systems follow ergative patterns, thus creating various cases of ergative splits and even a couple of fully ergative languages (Makushi, Kuikuro, in which the Set I system has been entirely lost). Gildea (1998) provides a detailed account of this diachronic development.

Underived adverbs usually take no morphology other than one nominalizing suffix. There are many postpositions, often formed with smaller locative or directional elements; they can take the same person-marking prefixes as nouns, and (usually) the same nominalizing suffix as adverbs. There are many particles in several syntactic subclasses and with various

Table 1 Rhythmic (iambic) stress: Tiriyo

1. Words with only light (CV) syllables, based on the stem *apoto* 'helper, servant'[a]		
apoto	[(a.po:).to]	'helper'

(S_P)	*∅-/ j-*	*a(j)-*	*k-*	*n(i)-*					

semantic and pragmatic contents (diminutives, evidentials, modals, etc.; cf. Hoff, 1986, 1990, for the Karinya case).

Class-changing morphology is quite rich. Verbs have many nominalizing affixes ('actual' vs. 'habitual' or 'potential' A, P, S; circumstance; action) and also adverbial-ized forms (participial, temporal, modal, etc.). There also are affixes for intransitivizing, transitivizing and causativizing verb stems (according to their valency). There are several noun verbalizers (inchoative: 'to produce/have N'; privative: 'to de-N X'; dative: 'to provide X with N').

Syntax

Cariban languages are famous as examples of the rare OVS word order (Derbyshire, 1977), with Hishkaryana as the first case study.

(1) *toto* *j-oska-je* *okoje* (Hishkaryana)
man LINKER-bite-PAST snake
'The snake bit the man.'
(Derbyshire, 1979: 87)

Tight syntactic constituents are few: most languages have only OV-phrases (only with third-person A and P), possessive phrases (possessor-possessed), and postpositional phrases. There are no modifier slots: 'modification' is carried out by the apposition of syntactically independent but pragmatically coreferential nominals (e.g., *the woman, that one, the tall one, the one with beads* instead of *that tall woman with beads*). Equative clauses can have a copula, but verbless clauses also occur:

(2) *tuhu* *ʃirə* (Bakairi)
stone this
'This is a stone.'
(author's data)

Negation is based on a special adverbial form of the verb, derived with a negative suffix (usually *-pɨra*, *-pra*, *-hra*, *-ra*, etc.), in a copular clause:

(3) *isapokara* *on-ene-pɨra* *aken* (Apalai)
lizard.sp 3NEG-see-NEG 1:be:PAST
'I did not see a *jacuraru* lizard.'
(Lit. lizard not-seeing-it I-was)
(Koehn and Koehn, 1986: 64)

Subordinate clauses are usually based on deverbal nominals or adverbials. In some languages, there are finite subordinate clauses (Panare, Tamanaku, Yukpa, Tiriyo). The sentences below exemplify relative clauses (in brackets): nominalizations (4) and finite clauses with relativizing particles (5).

(4) *kaikui* *ə-wa:rə,* *[pahko* (Tiriyo)
dog 2-known.to father
i-n-tu:ka-hpə]?
3-PAT.NMLZR-beat-PAST
'Do you know the dog that my father beat?'
(author's data)

(5) a. *tʃonkaiʔpe* *it-etʃeti* *pare* (Tamanaku)
which 3-name priest
[n-epu-i *netʃi]?*
3-come-PAST RELAT
'What is the name of the priest who has (just) come?'
(Gilij, 1782: III, 176)

b. *akeʃ* *peru* *[kat* *amo=n* *woneta]* (Yukpa)
that dog RELAT you=DAT 1.talk
sa=ne *siiw*
thus=3.be white
'The dog that I talked to you about was white.'
(author's data)

With verbs of motion, a special deverbal (supine) form is used to indicate the purpose of the displacement.

(6) *epɨ-he* *wɨ-tə-jai* (Wayana)
bathe-SUPINE 1-go-PRESENT
'I am going (somewhere) to bathe.'
(Jackson, 1972: 60)

Lexicon and Semantics

Cariban languages have few number words, usually not specifically numerical (one = alone, lonely; two = a pair, together; three = a few); higher numbers are expressed with (often not fully conventionalized) expressions based on words for *hand*, *foot*, *person* or *body*, or are borrowings. Spatial postpositions often distinguish: vertical support ('on'), containment ('in'), attachment/adhesion, Ground properties ('in open space,' 'on summit of,' 'in water'), and complex spatial configurations ('astraddle,' 'parallel to,'

'piercing'). Some languages have 'mental state' postpositions (desiderative: *want*; cognoscitive: *know*; protective: *protective toward*; etc.). There are different verbs for eating, depending on what is eaten; to every verb corresponds a noun designating the kind of food in question (e.g., Tiriyo *ənə* 'eat meat,' *otɨ* 'meat food'; *enapɨ* 'eat fruits, vegetables', *nnapɨ* 'fruit, vegetable food'; *əku* 'eat bread', *uru* 'bread food'; *aku* 'eat nuts,' *mme* 'nut food').

Caribbean Lexicography

L Winer, McGill University, Montreal, Quebec, Canada

© 2006 Elsevier Ltd. All rights reserved.

Glossaries of 'creolisms' of the Caribbean are found in works ranging from travelogues, novels, and cookbooks to scientific studies, particularly of local flora and fauna. Amateur word lists of varying lengths have also been written for several of the Caribbean territories. These have words and definitions, sometimes with proposed historical derivations, and often include proverbs. The best known are Ottley's series on 'Trinibagianese' (1965–1967), and Mendes's *Cote-ci cote-la*, (1986, 2000) both for Trinidad and Tobago (see also Baptiste, 1993; Haynes, 1987), but these are found for other territories including Jamaica (Maxwell, 1981; Rosen, 1987), Barbados (Collymore, 1955–1970), Belize (McKesey, 1974), Antigua (Christian, 1993), and the Virgin Islands (Seaman, 1967–1976; Valls, 1981). Some word lists focus on contributing languages, for example, Hindi (Mahabir and Mahabir, 1990) and French (Ryan, 1985) or specific domains, for example, dancehall (Francis-Jackson, 1995). These works of 'local slang' are generally intended for a popular, sometimes tourist, audience, often more to amuse than to inform. They are of very limited scope, have no standardized or consistent orthography, and though valuable, are often inaccurate, especially for derivations.

Scholarly lexicography in the English Caribbean began with the landmark *Dictionary of Jamaican English* (Cassidy and Le Page, 1967, 1980). This was the first regional dictionary to be prepared on the historical principles set down by the *Oxford English Dictionary;* it remains a valuable resource and model. Appearing after this are the *Dictionary of Bahamian English* (Holm with Shilling, 1982) and the *Dictionary of Caribbean English Usage* (Allsopp, 1996); the latter is designed to cover the entire English Caribbean beyond Jamaica. Both include illustrative citations and regional designations where known; the latter includes some historical information and guidelines for 'correct' usage. A historical dictionary for Trinidad and Tobago is in preparation (Winer, forthcoming). These dictionaries are all intended to have popular appeal and educational applications, as well as providing information for scholars and readers, especially in linguistics and literature.

Three concerns of current lexicography in the English Caribbean are of particular importance. The first is boundaries of inclusion (Winer, 1993: 48–57), which are often difficult to determine when so many words are shared by a regional English creole and an international standard English. For example, Where words have diverged in meaning, for example, *miserable* E. 'unhappy' vs. CE 'badly behaved,' or are commonly used in the Caribbean but are now archaic in SE, for example, *pappyshow* 'object of ridicule,' it is reasonable to include them. A common problem of amateur works is the inclusion of words as 'local' that are in fact informal or colloquial forms of standard English, for example, *jack up prices, bamboozle*.

The second problem is the lack of an agreed-upon standardized orthography, either within or between countries, with some people favoring a more phonetic approach, and some a more historical one (hampered by frequent uncertainty as to origin) (Winer, 1990). Finally, although all lexicographers may wish for better sources of etymologies, there is a particular lack of appropriate linguistic resources for a number of the major Amerindian and African languages especially relevant to the development of language in the Caribbean.

Carnap, Rudolf (1891–1970)

T P Górski, University of Wrocław, Poland

© 2006 Elsevier Ltd. All rights reserved.

Rudolf Carnap, born on May 18, 1891, in Wuppental (Germany), was a philosopher, logician, and mathematician. From 1910 to 1914 he studied philosophy, mathematics, and physics at the University of Jena and Freiburg, and took part in Frege's courses on the system of logic. Carnap planned to complete his dissertation in physics on thermionic emission, but the advent of World War I interrupted his studies. In 1917 he returned from the war and began to study the theory of relativity in Berlin. The new dissertation he developed dealt with an axiomatic system for the physical theory of time and space (greatly inspired by Kant's *Critique of Pure Reason*). It was issued in 1922 under the title *Der Raum*.

In 1925 Carnap moved to Vienna to accept the post of Assistant Professor at the University of Vienna, and within the next few years he became one of the leaders of the Vienna Circle. In 1931 he moved to Prague to become Professor of Natural Philosophy and four years later emigrated to the United States. He died on September 14, 1970, in Santa Monica, California.

Carnap's works deal mainly with semantics and formal logic, and their application to the methodology of sciences, and also the philosophy of sciences. He researched as well the issue of the basis of mathematics, the theory of probability, logical induction, and the theory of time and space. As his philosophical ideas developed, he underwent a profound change from positivism to neopositivism. In his early works he claimed that philosophical researches should be limited to only the logical analysis of scientific language to which he wanted to apply the traditional philosophy. At the same time, influenced by Wittgenstein, Carnap criticized all kinds of metaphysics, especially realism and idealism, which he called scientific pseudo-problems. Metaphysical statements, he claimed, are neither true nor false, but simply devoid of sense; they are statements only from the grammatical point of view, but logically, they are not statements. Carnap's classification of statements (formulas) in scientific languages may be seen in **Table 1**. The distinction between observational and theoretical formulas, as presented above, led Carnap to distinguish between two scientific laws: empirical and theoretical.

Table 1 Carnap's classification of statements (formulas) in scientific languages

Type of statement	*Observational terms*	*Theoretical terms*
Logical statements	No	No
Purely theoretical statements	No	Yes
Observational sentences	Yes	No
Rules of correspondence	Yes	Yes

Carnap's radical ideas are strongly connected with his view on verification of sentences, and with the need to construct a common language for all empirical sciences. Later, however, the idea of a common language was replaced by a postulate of transformation of (through either reducing or eliminating) the general scientific terms into the language of classical physics. In his last years his views were less categorical. He formulated a kind of basis for the construction of a scientific language, allowing for the use of scientific languages constructed differently. Carnap tried to combine his empiric attitude (connected with the science of natural history) with phenomenalism (a tendency of subjective treatment of experience). Thus, his ideological metamorphosis added also to the decrease of the phenomenological approach.

Introduction

Maps suggest an intrinsic and largely unconscious link between knowledge and visual representation (pictures, diagrams, etc.), with one implying the other. A map is a type of diagram that allows a user to find places on terra firma through a drawing of those places. **Figure 1**, for example, shows how to go from one location (**A**) to another (**B**). The locations are represented as points and the streets as lines meeting at right angles. Getting to **B** involves traveling west two blocks and north three blocks from location **A**. Compass directions are specified as N = north, S = south, E = east, W = west; and blocks with equally calibrated units on the lines:

With such simple diagrammatic elements (points, lines, etc.), it is actually possible to represent all kinds of actual topographical spaces, in outline form. A map can thus be defined, semiotically, as a diagrammatic text constructed with elemental visual signifiers (*see* **Visual Semiotics**) that are designed to indicate where a topographical object (a place, a river, a mountain, etc.) is located on terra firma, by using signifiers that resemble the features they represent in schematic, or in some cases, actual pictographic form. For example, a small tree might stand for a forest, an orchard, or a state park. But many signifiers have little resemblance to the features they represent, as when a circle stands for a city. The same sign may represent different features on different maps. For example, a triangle might represent a mobile home park on one map and an eagle's nest on another. Such differences make it important to read the map 'legend,' as it is called, to find out what each sign means on a particular map.

Figure 1 Map of how to get from **A** to **B**.

The relation of the elements to each other involves 'scaling.' A scale shows the mathematical relationship by which distances on a map reduce actual distances on Earth. Many maps illustrate scale by marking off distances on a straight line. Each mark shows how distance on the line corresponds to miles, kilometers, or other units of measurement on Earth. Other maps state the scale in words and figures. Such a scale might appear as *1 inch: 16 miles*. In this relationship, 1 inch (2.5 cm) on the map represents a distance of 16 miles (26 km).

Representative fractions are also used to show scale. These indicate the number of distance units on Earth represented by one unit on the map. In the example above, where the scale is 1 inch: 16 miles, the representative fraction would be 1:1 000 000 or 1/1 000 000, because there are 1 000 000 inches in 16 miles. The relationship remains the same for inches,

Introduction

Maps suggest an intrinsic and largely unconscious link between knowledge and visual representation (pictures, diagrams, etc.), with one implying the other. A map is a type of diagram that allows a user to find places on terra firma through a drawing of those places. Figure 1, for example, shows how to go from one location (**A**) to another (**B**). The locations are represented as points and the streets as lines meeting at right angles. Getting to **B** involves traveling west two blocks and north three blocks from location **A**. Compass directions are specified as N = north, S = south, E = east, W = west; and blocks with equally calibrated units on the lines:

With such simple diagrammatic elements (points, lines, etc.), it is actually possible to represent all kinds of actual topographical spaces, in outline form. A map can thus be defined, semiotically, as a diagrammatic text constructed with elemental visual signifiers (*see* **Visual Semiotics**) that are designed to indicate where a topographical object (a place, a river, a mountain, etc.) is located on terra firma, by using signifiers that resemble the features they represent in schematic, or in some cases, actual pictographic form. For example, a small tree might stand for a forest, an orchard, or a state park. But many signifiers have little resemblance to the features they represent, as when a circle stands for a city. The same sign may represent different features on different maps. For example, a triangle might represent a mobile home park on one map and an eagle's nest on another. Such differences make it important to read the map 'legend,' as it is called, to find out what each sign means on a particular map.

Figure 1 Map of how to get from **A** to **B**.

The relation of the elements to each other involves 'scaling.' A scale shows the mathematical relationship by which distances on a map reduce actual distances on Earth. Many maps illustrate scale by marking off distances on a straight line. Each mark shows how distance on the line corresponds to miles, kilometers, or other units of measurement on Earth. Other maps state the scale in words and figures. Such a scale might appear as *1 inch: 16 miles*. In this relationship, 1 inch (2.5 cm) on the map represents a distance of 16 miles (26 km).

Representative fractions are also used to show scale. These indicate the number of distance units on Earth represented by one unit on the map. In the example above, where the scale is 1 inch: 16 miles, the representative fraction would be 1:1 000 000 or 1/1 000 000, because there are 1 000 000 inches in 16 miles. The relationship remains the same for inches,

centimeters, miles, kilometers, or any other units of measurement.

Given the obvious relevance of maps to semiotics, it is somewhat surprising to find that genuine interest on the part of semioticians in maps goes back only to 1967, with the appearance of Bertin's *Sémiologie graphique* (1967). However, since then, interest has burgeoned, as has interest in the use of semiotic theory among cartographers (e.g., Casti, 2000; Foote, 1985, 1988; Hsu, 1979; Ljungsberg, 2002, 2004; Palek, 1991; Pravda, 1993, 1994; Schlichtmann, 1985, 1999a; Wood and Fels, 1986), leading to the materialization of a branch that is now called 'cartosemiotics' (Wolodtschenko, 1999). A general survey of cartosemiotic literature can be found in Schlichtmann (1999b).

Historical Background

As with any socially functional text, maps tend to condition how groups perceive and interpret territories. To illustrate how a map can do this, consider the technique of cylindrical projection in Western mapmaking. Developed by the Flemish geographer Gerardus Mercator (1512–1594), it consists of wrapping a cylinder around the globe, making it touch the equator, and then projecting (1) the lines of latitude outward from the globe onto the cylinder as lines parallel to the equator, and (2) the lines of longitude outward onto the cylinder as lines parallel to the prime meridian (the line that is designated 0° longitude, passing through the original site of the Royal Greenwich Observatory in England). The resulting two-dimensional map can be made to represent the world's surface as a two-dimensional plane figure such as a rectangle or an ellipse. Figure 2 is an example of the latter.

Because of the curvature of the globe, the latitude lines on the map nearest the poles appear closer together. This distortion makes the sizes of certain landmasses appear smaller than they are. Indeed, the very concept of 'worldview' derives from the fact that the ways in which we come to 'view the world' are, in part, a consequence of how that world is represented for viewing by the maps we make of it.

Although modern technology now makes it easy to construct three-dimensional and, thus, nondistorting maps, traditionally the term 'map' has designated a two-dimensional representation of an area; three-dimensional maps are more accurately known as 'models.' All civilizations have developed mapmaking techniques to meet a host of social needs. In many cultures, these were elaborated and refined in tandem with the rise and growth of the mathematical sciences. Since Mercator invented the cylindrical projection method, most mapmaking techniques have been devised in accordance with the principles of Cartesian coordinate geometry. This consists, essentially, of two perpendicular number lines in a plane. Points of a geometric figure are located in the plane by assigning each point two coordinates (numbers) on the number lines x and y. The x-coordinate, called the line of latitude in cartography, gives the location of the point along the horizontal number line. The y-coordinate, called the line of longitude, locates the point along the vertical number line.

Figure 2 The Mercator projection.

By convention, longitude is marked 180° east and 180° west from 0° at Greenwich, England. Latitude is marked 90° north and 90° south from the 0° parallel of the equator. Points on a map can be accurately defined by giving degrees, minutes, and seconds for both latitude and longitude. As mentioned, distances are represented with the technique of 'scaling,' whereby two points on the earth are converted to two corresponding points on the map by means of a scale: for example, a scale of 1:100 000 means that one unit measured on the map (say 1 cm) represents 100 000 of the same units on the earth's surface. The varying heights of hills and mountains, and the depths of valleys, are portrayed instead with the technique known as 'relief.' In earlier maps, this consisted in making small drawings of mountains and valleys on the maps. But this was extremely imprecise and thus came eventually to be supplanted by the use of 'contour lines.' The shapes of these lines provide accurate representations of the shapes of hills and depressions, and the lines themselves show actual elevations, so that closely spaced contour lines indicate steep slopes. Other methods of indicating elevation include the use of colors, tints, hachures (short parallel lines), and shadings. When colors are used for this purpose, a graded series of tones is selected for coloring areas of similar elevations. Shadings or hachures, neither of which show actual elevations, are more easily interpreted than contour lines and are sometimes used in conjunction with them for achieving greater fidelity in representation.

The first known maps were made by the Babylonians around 2300 B.C. Carved on clay tablets, they consisted largely of land surveys made for the purposes of taxation. More extensive regional maps, drawn on silk and dating from the 2nd century B.C., have been found in China. The precursor of the modern map, however, is believed to have been devised by the Greek philosopher Anaximander (ca. 611–ca. 547 B.C.). It was circular and showed the known lands of the world grouped around the Aegean Sea at the center and surrounded by the ocean. Anaximander's map constituted one of the first attempts to think beyond the immediate territorial boundaries of a particular society – Greece – even though Anaximander located the center of the universe in the Aegean Sea. Then, around 200 B.C., the Greek geometer and geographer Eratosthenes (276?–195? B.C.) introduced the technique of parallel lines to indicate latitude and longitude, although they were not evenly and accurately spaced. Eratosthenes's map represented the known world from present-day England in the northwest to the mouth of the Ganges River in the east and to Libya in the south. About 150 A.D., the Egyptian scholar Ptolemy (ca. 100–ca. 170 A.D.) published the first textbook in cartographic science, entitled *Geographia*. Even though they contained a number of errors, his were among the first maps of the world to be made with mathematical principles. At about the same time in China, mapmakers were also beginning to use mathematically accurate grids for making maps. Figure 3 is Ptolemy's map of the world, which may have been made by Ptolemy himself or by

Figure 3 Ptolemy's map of the world.

cartographers who rediscovered his work after it had been lost for many centuries.

The next step forward in cartography came in the medieval era, when Arab seamen made highly accurate navigational charts, with lines indicating the bearings between ports. In the 15th century, influenced by the publication of Ptolemy's maps, European mapmakers laid the foundations for the modern science of cartography. In 1507, for instance, the German cartographer Martin Waldseemüller (ca. 1470–ca. 1522) became the first to apply the name America to the newly identified trans-Atlantic lands, separating America into North and South – a cartographic tradition that continues to this day – and differentiating the Americas from Asia. In 1570, the first modern atlas – a collection of maps of the world – was put together by the Flemish cartographer Abraham Ortelius (1527–1598). The atlas, titled *Orbis Terrarum*, contained 70 maps.

Undoubtedly, the most important development in the 16th century came when Mercator developed the technique of cylindrical projection in 1569, as mentioned above (Crane, 2002). This allowed cartographers to portray compass directions as lines, at the expense, however, of the accurate representation of relative size. By the 18th century, the modern-day scientific principles of mapmaking were well established. With the rise of nationalism in the 19th century, a number of European countries conducted topographic surveys to determine political boundaries. In 1891, the International Geographical Congress proposed the political mapping of the entire world on a scale of 1:1 000 000, a task that occupied cartographers for over a century. Throughout the 20th century, advances in aerial and satellite photography, and in computer modeling of topographic surfaces, have greatly enhanced the versatility, functionality, accuracy, and fidelity of mapmaking.

Today, the so-called Geographic Information System (GIS) consists of computers, computer programs, and extremely large amounts of information, which is stored as computer code and can include measurements or photographs taken from land, sea, or space. Cartographers can use GIS to produce many different maps from the stored data. These are easily stored on computer software or devices, such as CD-ROMs, which enable people to choose exactly the area they want to view, then print a map. There are now also in-vehicle navigation systems that create maps to guide drivers of moving vehicles. These systems constantly track a vehicle's location by using signals from a group of space satellites called the Global Positioning System (GPS). A computer in the vehicle combines the position data with stored street map data and produces maps of the route to a destination. The maps change as the vehicle moves. Some in-vehicle systems show the map on a small screen. Other systems produce spoken directions.

To navigate airplanes, aeronautical charts are used. Depending on their level of certification, pilots use Visual Flight Rules (VFR) or Instrument Flight Rules (IFR) charts. VFR charts show landmarks that pilots can see as they fly, such as roads, bridges, and towns. These also show airports and indicate the heights of mountains and other obstacles. IFR charts are designed for radio navigation. These show the location of transmitters of high-frequency radio signals. Pilots use these signals to determine their position and plot their course. Some airplanes are equipped with computer systems that produce heads-up display maps. These are projected near eye level where the pilot can see them without looking down.

General Semiotic Considerations

How do we interpret a map? To say 'I am here, but I want to get to there' on a map involves two levels of interpretation: (1) that *here* and *there* are indexes (signs indicating location) in map space standing for points in real space, and (2) that the movement from here to there on a map stands for the corresponding movement between two points in real space through scaling.

Modern mapmaking is based, as mentioned, on the principles of Cartesian geometry, which segment the map space into determinable points and calculable scaled distances. The traditional maps of North American aboriginal peoples, on the other hand, are designed to show the interconnectedness among the parts within the map space through a distortion of distance, angulation, and shape, not through segmentation and scaling. Western maps represent the world as an agglomeration of points, lines, and parts, related to each other in terms of the mathematics of the Cartesian plane; aboriginal maps represent it instead as a holistic, unsegmentable entity.

The two types of mapmaking systems thus reveal different worldviews. These have had specific 'consequences,' such as village and city design. Cartesian mapmaking has clearly influenced the design of modern cities. Not only does the layout of the city of New York, for example, mirror a Cartesian map, but the city also names its streets largely in terms of the grid system: for example, 52nd and 4th refers to the intersection point of two perpendicular lines in the city grid. In a fundamental semiotic sense, such cities are the 'iconic byproducts' of the worldview that has been enshrined into groupthink by the widespread use of grid maps since the early 16th century.

As representations of terra firma, maps are also 'intellectual codes' and can thus be used as both navigational and exploratory models of the world. In the same way that the sciences of geometry and trigonometry have allowed human beings to solve engineering problems since ancient times, the science of cartography has allowed explorers to solve navigation and exploration problems with amazing accuracy. Exploration involves determining position and direction. Position is a point on the earth's surface that can be identified in terms of a grid or coordinate system. Direction is the position of one point relative to another within the system. The shortest distance between two points is a straight line, and since any line in the plane is a hypotenuse, then its length can be determined easily by the Pythagorean theorem. In this way, maps have allowed navigators to fix points and determine distances to regions of the plane (i.e., the earth's surface). Explorers setting out on a journey may not know what they will encounter along the way, nor will they know in advance if they will reach a land mass or a body of water. But they can still take that journey with a high degree of assurance that they will be able to predict where they are on terra firma.

Exploration is ancient. According to many archaeologists and historians, it began approximately 3000 years ago in the area of the eastern Mediterranean Sea. Since then nearly every portion of the earth's land surface has been explored and mapped. Space photography and advanced measurement technology, including a laser reflector placed on the moon, have made possible extremely precise measurements of the earth's surfaces. Considerable work is now being carried out to investigate the vast regions that are under the seas.

What is even more remarkable is that cartography has permitted us to describe the positions of heavenly bodies and to calculate their distances from Earth with accuracy. Suffice it to say here that mapping outer space involves the use of techniques that correspond to terrestrial point fixing in terms of latitude and longitude lines. Simply put, the positions of stars relative to one another are regarded as points on a celestial map; the motion of the sun, the moon, and the planets is then indicated as a mean rate of progression across the celestial space. It is truly mind-boggling to think that with the aid of a simple representational device (the map), we have already been able to set foot on the moon and will no doubt be able to visit other places in the skies in the not-too-distant future.

As a final word on the navigational uses of maps, the recent development of computer systems that are used in advanced traffic management to improve traffic control merits some consideration here. Traffic along major highways in some cities is monitored by remote cameras, radar, or sensors in the roadway. A central computer system analyzes the information. If roads are congested, traffic flow can be improved by automatically adjusting traffic-signal timing, controlling traffic flow on freeway ramps, or providing information to drivers by means of electronic signs along the roads. Advanced traveler-information systems are also currently available in some automobiles. These are navigational systems into which drivers enter their destination. An electronic map then displays the best route on a small screen, or a synthesized voice provides directions along the route, including directions on when to turn. These systems use a transponder, or a transmitting and receiving device, in the vehicle and a satellite-based GPS to pinpoint the exact location of the vehicle along its route. When this navigation system is coupled with cellular-radio technology, it can be used to signal a central dispatcher in case of an emergency.

Maps as Texts

Reading maps constitutes a culture-specific form of text-interpretation. A map of New York City would probably not be interpreted as a map by a nomad from the north of Iraq or by an Inuit hunter in Nunavut. A map is identified as such because the visual signifiers that compose it (lines, colors, shapes, and so on) are understood as topographical elements. Like any text (*see* **Texts: Semiotic Theory**) understanding that these elements are part of a whole implies understanding the cartographic code – which in the case of Western maps is Cartesian in nature. Map reading is thus a culture-based text decipherment process, in which the reader constructs the meaning of the map out of the elements that have been assigned specific roles and positions on the text according to the position and relationships between them in the real world. As Wood and Fels (1986) argued, every map is a synthesis of signs and a sign in itself – an artifact of depiction of referents and an instrument of promoting worldview. Like any other kind of text, it is a product of a specific code – a set of conventions that prescribe relations of content and expression in given contexts.

As noted above, some of the elements that constitute a map text include combinations of lines, shapes, and colors to denote road types, green spaces, lakes, and other water bodies, together with miscellaneous types of buildings. The relationships between these elements directly correspond to relationships between the objects and spaces in the real world. A map reflects the real world's structure in the way that the signifiers are combined together – buildings don't

overlap, they are not built in the middle of roads, there is no parkland in the middle of a lake, and so on.

Like any text, moreover, a map is created with an audience in mind, unless it is a personal map. Thus, once the map is finished, the author relinquishes his or her rights to the interpretation of the map, and the text belongs to the audience, which 're-writes it,' 're-fashions' it, or 'adds to' it to suit its specific interpretive needs. If we know the audience for which the map was made, and we compare it to maps made for other audiences, the differences between the two can tell us a lot about the author's intentions, the social situation of the audiences, and the type of power discourse that the map supports or undermines.

A map is supposed to be denotative in that it must resemble the area it represents as closely as possible. Yet, as Derrida (1976) cogently argued in reference to any text, the actual social meanings of maps are constantly 'slipping away' from each other, constantly shifting and changing so that they can never be exactly determined. The slippage in this case is due to the fact that a map is the simplification of a complex topographical object, either drawn on paper or modeled on computer with the aid of photography (which provides perspective).

The modern history of scientific cartography has, in fact, revolved around attempts to solve the slippage problem. To represent the entire surface of the earth without distortion requires a spherical globe. A flat map cannot accurately represent the earth's rounded surface except for very small areas where the curvature is negligible. To accurately display large or medium sized parts of the earth's surface a map must be drawn with distortions of areas, distances, and directions. Various projection techniques are used to prepare flat maps of the earth's surface. These are classified as geometric or analytic depending on the technique used to develop them. Geometric projections are classified based on the type of surface on which the map is assumed to be developed (i.e., cylinders, cones, or planes), while analytical projections are developed by mathematical computation.

Solving the slippage problem has been greatly assisted, needless to say, by technological innovations since World War II. Perhaps most important has been the use of remote-sensing techniques that gather information about an area from far above the ground via aerial and satellite photography. Improvements in satellite technology, computer software, and the use of satellite triangulation have substantially improved the accuracy of remote-sensing techniques and of today's maps.

The foundation of a modern map is a careful survey giving geographical locations and relations of many points in the area being mapped. Nearly all maps developed today make use of both remote-sensing and traditional land-surveying information. Once the information is collected, the map is carefully planned with regard to its final use, so that the information can be rendered clearly and accurately. The collected surveys and remote-sensed data are then used to enter a large number of points on a grid of crossed lines corresponding to the projection chosen for the map. Elevations are determined and contour lines, roads, and rivers are drawn. Final preparation of a map for printing begins by making a series of sheets, one for each color used on the map, that are then scribed onto the surface by a sharp etching tool. Each of these sheets is then used as a negative from which a lithographic plate is made.

But despite all the technological innovations, a map is still a text and, thus, subject to slippage, albeit of a different kind. Reading precisely made maps still requires knowing that the elements on them are signifiers that cohere into an overall representation of space, even if the representation has largely eliminated scale and angle distortions. A device such as a continuous-curve plotter enables a computer to draw accurate maps from the stored data. Computer-generated maps can also be displayed on a video screen, where an operator can easily make alterations in the content. Because such maps, and each incorporated change, can be stored in the computer, they are useful in furnishing an animated picture of a change over a period of time.

Conclusion

The map is an important tool, not only for navigation and exploration purposes, but also for cultural identification purposes. In addition to providing a wealth of factual information, the map permits visual comparison between areas because it may be designed to indicate, by means of symbols, not only the location but also the characteristics of geographic features of an area and, thus, to give it a representation. Like any 'memory code,' such as a history book, this can then be stored for preservation. No wonder, then, that geographers have developed a standard pattern of map symbols for identifying such cultural features as homes, factories, churches, dams, bridges, tunnels, railways, highways, travel routes, mines, farms, and grazing lands.

As map viewers, we think that we have 'topographical reality' laid bare before us. But, as cartosemiotics has shown (and as has been argued in this article), understanding maps involves a process of text decipherment on the part of reader – even if the 'reader' is a computer (which still has to be programmed by a human being). Studying maps from a

semiotic point of view leads to a complex picture of the possibilities and the limitations that the map offers (Foote, 1985, 1988). Technologically made maps belong to a contemporary code of mapmaking that involves the use of informatics. But informatics itself is a code of its own. In effect, the lesson to be learned from studying maps semiotically is that no matter how accurate we try to make our scientific texts, they are inevitably subject to human interpretation in psychological, historical, and cultural terms.

Case Marking

Case is essentially a system of marking dependent nouns for the type of relationship they bear to their heads. Traditionally, the term refers to inflectional marking, and, typically, case marks the relationship of a noun to a verb at the clause level or of a noun to a preposition, postposition, or another noun at the phrase level. Straightforward examples of case systems can be found in the Dravidian languages. **Table 1** shows the set of case forms for the noun *makan* 'son' in Malayalam.

The nominative is the citation form and is used for the subject of a clause. The accusative is used for the direct object and the dative for the indirect object (the recipient of a verb of giving). The genitive expresses the possessor (*makan̲re peena* 'son's pen') and the sociative (alternatively comitative) expresses the notion of 'being in the company of'. The locative expresses location, and the instrumental expresses the instrument, as in 'cut with a knife' and the agent of the passive. The ablative expresses 'from'. It is built

Dative	makan̲nə
Genitive	makan̲re
Sociative	makanooɽə
Locative	makanil
Instrumental	makanaal
Ablative	makanilninnə

on the locative, and some linguists would take a form like *makanilninnə* to consist of the locative plus the postposition *ninnə*.

Malayalam and the other Dravidian languages provide good examples of case systems since these languages are agglutinative and the case marking (*-e* accusative, *-il* locative, etc.) can easily be isolated. Moreover, the case marking is consistent across singular and plural. Plural is marked as a first-order suffix between the stem and the case marking, as in the following:

(1) Kappal tiramaala-kaɭ-e bheedicu.
ship *wave*-PL-ACC *split*-PT
'The ship broke through the waves.'

In Malayalam, the accusative case is generally used for the direct object only for human nouns, the nominative being used for other nouns. However, where both subject and object are inanimate as in (1), the accusative is used.

Case systems are a feature of conservative Indo-European languages such as Russian and Greek, and much of our framework for describing case comes from the study of the classical languages Ancient Greek, Latin, and Sanskrit. However, there is a complication in these languages in that number marking and case marking are never separate. This means separate paradigms for the two number categories of singular and plural. Moreover, there are different case/number forms for different stem classes. Traditionally five such classes are recognized, and there are also variations within the classes. Three of these classes, or declensions as they are usually referred to, are illustrated in Table 2: the first declension (*ā*-stems), second declension (*o*-stems). and third declension (consonant stems and *i*-stems). The designations *ā*-stems, *o*-stems, and so forth are not synchronically transparent and reflect the product of historical reconstruction.

In Latin, there is also a three-way gender distinction: masculine, feminine, and neuter. With a few exceptions male creatures are masculine and females feminine, but inanimates are scattered over all three genders (though almost all neuter nouns are inanimate). There is a partial association of form and gender in that *ā*-stems are almost all feminine and *o*-stems mostly masculine (except for a subclass of neuters, represented by *bellum* in Table 2). This means that there can be fusion of gender, number, and case. The point is illustrated in Table 2, where we have *domina* 'mistress (of a household)' illustrating feminine *ā*-stems and *dominus* 'master (of a household)', which is based on the same root, representing masculine *o*-stems. As can be seen from Table 2, the word form *domina* simultaneously represents nominative case, feminine gender, and singular number; *dominum* represents accusative case, masculine gender, and singular number; and similarly with other word forms.

In Latin, adjectives decline like nouns, and there is concord between a noun and an attributive or predicative adjective. This concord is sensitive to case and number, and those adjectives that belong to the first and second declension are sensitive to gender. So we find *domina bona* 'good mistress' and *agricola bonus* 'good farmer', where *agricola* is one of the few nouns of masculine gender in the first declension. With adjectives of the first and second declensions, the inflections simultaneously represent case, number, and gender without exception.

Table 2 Latin case paradigms

	1	*2*		*3a*	*3b*
	ā-stems	*o*-stems		cons.stems	*i*-stems
	feminine	masculine	neuter		
	domina	*dominus*	*bellum*	*cōnsul*	*cīvis*
	'mistress'	'master'	'war'	'consul'	'citizen'
Singular					
Nominative	*domina*	*dominus*	*bellum*	*cōnsul*	*cīvis*
Vocative	*domina*	*domine*	*bellum*	*cōnsul*	*cīvis*
Accusative	*dominam*	*dominum*	*bellum*	*cōnsulem*	*cīvem*
Genitive	*dominae*	*dominī*	*bellī*	*cōnsulis*	*cīvis*
Dative	*dominae*	*dominō*	*bellō*	*cōnsul,*	*cīvī*
Ablative	*dominā*	*dominō*	*bellō*	*cōnsule*	*cīvī, cīve*
Plural					
Nominative	*dominae*	*dominī*	*bella*	*cōnsulēs*	*cīvēs*
Vocative	*dominae*	*dominī*	*bella*	*cōnsulēs*	*cīvēs*
Accusative	*dominās*	*dominōs*	*bella*	*cōnsulēs*	*cīvīs, cīvēs*
Genitive	*dominārum*	*dominōrum*	*bellōrum*	*cōnsulum*	*cīvium*
Dative	*dominīs*	*dominīs*	*bellīs*	*cōnsulibus*	*cīvibus*
Ablative	*dominīs*	*dominīs*	*bellīs*	*cōnsulibus*	*cīvibus*

Six cases are recognised: nominative, vocative, accusative, genitive, dative, and ablative; however, no paradigm exhibits six different forms. In the traditional descriptions, a case is established wherever there is a distinction for any single class of nominals, since this facilitates the description of the functions. The vocative, the case used in forms of address, has a distinctive form only in the singular of the second declension. Elsewhere there is a common form for the nominative and vocative; however, distinct nominative and vocative cases are recognized for all paradigms. The utility of this approach can be seen in a phrase such as *O sōl laudande* 'Oh, praiseworthy sun'. Here the adjective has a distinctive vocative form (masculine, singular) but the noun *sōl* does not, but we can still say there is concord.

Types of Case

The term *case* is from Latin *cāsus*, which is in turn a translation of the Greek *ptōsis* 'fall'. The nominative was considered the basic form of nominals, and the other cases 'fell away' from this form and were referred to as the oblique cases. In some languages there is a formal difference between the nominative and the oblique, inasmuch as the oblique cases are built on a common oblique stem. In Malayalam, for instance, some nouns such as *maram* 'tree' have an oblique stem *maratt-* so the accusative is *maratte*, locative *marattil*, and so on (cf. Table 1).

In the description of cases, a distinction is often made between syntactic or grammatical cases and semantic cases. The nominative and accusative are grammatical cases in that they encode the grammatical relations of subject and object respectively, whereas a case such as the locative in Malayalam is semantic in that it expresses a specific semantic role, namely, the notion of position. It can also be said that nominative and accusative function to distinguish arguments of a predicate, whereas a semantic case has content and is a predicate. A further distinction is sometimes made among the semantic cases between local and nonlocal cases. Local cases are those referring to place such as locative ('at'), allative ('to'), and ablative ('from'). However, the distinction between grammatical and semantic case is blurred somewhat by the fact that a primarily grammatical case can have a semantic function and a semantic case can have a grammatical function. In Latin the accusative, a grammatical case, is used to express destination *Vādō Rōmam* 'I go to Rome' and extent or duration, as in *xxv annōs* 'for 25 years', and the ablative, a semantic case, is used for the logical subject in the passive (*occīsus ā cōnsule* 'killed by the consul').

The genitive case is distinct from the others in that it is typically adnominal, marking the dependent of a nominal, whereas the other cases typically mark the dependents of verbs. The genitive has a semantic function, namely that of expressing possession, as in the Latin phrase *cōnsulis equus* 'the consul's horse', but it can have a variety of other functions. In Latin its grammatical character can be seen particularly in a phrase such as *amor patris*. This phrase is ambiguous: it can mean either the love felt by a father or the love directed towards the father. The former is called the subjective genitive since *pater* corresponds to the subject in the verbal expression: *Pater amat* 'Father loves'. The latter is called the objective genitive since *pater* corresponds to the object in *Amat patrem* 'He or she loves father'.

The dative case takes its name from the Latin verb *dāre* 'to give' since it expresses the recipient of verbs of giving. In Latin the dative also expresses the complement of a handful of two-place verbs such as *fidere* 'to trust' and *parēre* 'to obey'. It additionally expresses the experiencer of a few verbs such as *placēre* 'to please': *Dominō non placet bellum* 'War is not pleasing to the master'. A similar range of functions can be found in a number of languages. However, in a few languages, and regularly across the Indian subcontinent, the dative encodes the actor in certain aspects. In Malayalam, for instance, the dative in conjunction with the potential marker *-aam* on the verb signals physical ability or permission.

(2) Avalkku avane itikkaam.
her.DAT *him*.ACC *can/may.hit*
'She can hit him.'

The Latin ablative also illustrates a further complication. Although nominally a semantic case expressing 'from', it represents a syncretism of an ablative, locative, and instrumental, which were distinguished in earlier stages of the language, and therefore it expresses a variety of semantic roles.

A more useful distinction than between syntactic and semantic cases is between core and peripheral cases, where the core refers to subject and object.

Types of Case System

Accusative system

The most common system of core cases is one that opposes nominative for subject and accusative for object. This system is found in various language families, including Indo-European, Uralic, Turkic, Mongolian, Tungusic, and Dravidian (see (1) above), as well as in Korean and Japanese (see (15) below).

Ergative system

A sizable minority of languages have one case for the agent of a transitive verb (A) and another for the subject of an intransitive predicate (S) and direct object (O). The former is called the ergative case, and the latter is called either nominative or absolutive. The latter label is also used for a grammatical relation covering S and O. The absolutive is usually unmarked, as in the following illustration from Yalarnnga (Australian).

(3) Yirri tjala ngani-mi yimarta-ta.
man.ABS *this*.ABS *go*-FU *fish*-PURP
'The man will go for fish.'

(4) Kilawurru tjala yirri-nthu wala-mu payarla-yu.
galah.ABS *this*.ABS *man*-ERG *hit*-PT *boomerang*-ERG
'A man killed the galah with a boomerang.'

Note that in (4) the ergative also encodes the role of instrument. It is very common for ergatives to have non-core functions, another example of grammatical cases having semantic functions.

Ergative systems are often considered rare and remote, but in fact they make up at least 20% of the world's languages. Ergative systems are to be found in Basque, all families of the Caucasian phylum, in the Tibeto-Burman languages, in Austronesian, in most Australian languages, in some languages of the Papuan families, in Eskimo-Aleut, in Tsimshian and Chinook in North America, in the Mayan languages of Central America and several families of South America (Dixon, 1994:5), and in Hurrian and several other languages of the ancient Near East.

Split-intransitive system

Some languages, perhaps no more than a few score, organize their core grammar so that the argument of some one-place predicates is marked like the A of a two-place verb, while the argument of the other one-place predicates is marked like the O of a two-place verb. Such languages have been called split-intransitive languages or split-S languages (Dixon, 1994:70ff). Examples can be found in the Kartvelian (South Caucasian) languages of the Caucasus. The following sentences are from Laz. Note that the suffix *-k*, glossed ergative on the basis of its appearance on A in transitive clauses like (7), also appears on the 'agent' of the intransitive verb in (5). On the other hand, the subject of the intransitive verb in (6) is unmarked like the O of (7).

(5) Bere-k imgars.
child-ERG 3SG.*cry*
'The child cries.'

(6) Bere oxori-s doskidu.
child.ABS *house*-DAT 3SG.*stay*
'The child stayed in the house.'

(7) Baba-k meçcaps skiri-s cxeni.
father-ERG 3SG.*give*.3SG.3SG *child*-DAT *horse*.ABS
'The father gives a horse to his child.'

This pattern also occurs in Georgian, but it applies only to certain classes of verbs in the aorist tense group. In the present tense, all subjects are in the nominative case and the direct objects in the dative.

The active system is also found in the Americas, where it usually shows up in the bound pronouns on the verb. It has been reported from Guaraní (Andean); Lakhota (Lakota) and other Siouan languages; the Pomoan (Pomo) languages; Caddo, Arikara, and other Caddoan languages; and Mohawk, Seneca, and other Iroquoian languages. It also occurs in Acehnese (Austronesian).

Direct-Inverse System

Another system of marking the core relations is the direct-inverse system. In this system, which is characteristic of the Algonquian languages, the marking on the verb indicates whether an activity is direct or inverse. If the action proceeds from first or second person to third it is direct, but if it proceeds from third to first or second it is inverse. In transitive clauses with two third-person participants, the direct and inverse markers distinguish whether a more topical participant (proximate) is A, which gives a direct combination, or a less topical participant (obviative) is A, which gives an inverse combination. A 'more topical participant' will be chosen on the basis of discourse principles and will tend to be the last-mentioned person or the discourse topic. The 'less topical person' is marked by the obviative suffix *-wa*.

(8) a. Nāpēw atim-wa wāpam-ē-w.
man.PROX *dog*-OBV *see*-DIRECT-3SG
'The man saw the dog.'
b. Nāpēw-(w)a atim wāpam-ik.
man-OBV *dog*.PROX *see*-INVERSE.3SG
'The man saw the dog.'

(9) a. Atim nāpēw-(w)a wāpam-ē-w.
dog.PROX *man*-OBV *see*-DIRECT-3SG
'The dog saw the man.'
b. Atim-wa nāpēw wāpam-ik.
dog-OBV *man*.PROX *see*-INVERSE.3SG
'The dog saw the man.'

As can be seen, there are two ways of expressing the same propositional content according to which participant is chosen as topic.

Factors Affecting Marking

It is not common to find languages in which the nominative-accusative or absolutive-ergative distinction holds for all nominals in every context. The 'older' Indo-European languages such as Latin might be thought to provide good examples of a nominative-accusative distinction, but this distinction is neutralized for nouns of the neuter gender. This is illustrated by the word *bellum* 'war' in Table 2. Almost all neuter nouns in Latin are inanimate, though there are numerous inanimates that have masculine or feminine gender. Even in languages like Japanese and Korean, in which the subject and object are marked by postpositions (see (15) below), there is a tendency to drop the postpositions in colloquial speech; the subject marker is more likely to be lost if the subject is pronominal or human, and the object marker is more likely to be lost if the object is inanimate or indefinite. In fact, there is a very strong cross-language tendency for object marking to be confined to objects that are pronominal, human, or definite. In Spanish, for instance, subject and object are distinguished in the clitic pronouns, but with free nominals the preposition *a*, which otherwise means 'to', is used with specific human objects: *Busco un empleado* 'I'm looking for an employee' (anyone will do), *Busco a un empleado* 'I'm looking for an employee' (the one who was here a minute ago).

A large number of languages mix accusative and ergative marking, but the two types of marking tend to complement one another. If we take the hierarchy in Table 3, we can say that where accusative or ergative marking co-occur, accusative marking covers a continuous segment of the hierarchy from the top and ergative from the bottom. In the Pama-Nyungan languages of Australia, for instance, ergative marking is found on all nouns. It may extend to third-person pronouns, and in a few languages it covers all nominals. Accusative marking in these languages is generally found on all pronouns. In some, it extends to cover kin terms and personal names, or all humans as well.

The principle that seems to underlie these restrictions on marking reflects a view that the most natural transitive predication is one with an agent at the top of the hierarchy and a patient at the bottom. Marking tends to be confined to deviations from this ideal, that is, mark pronominal objects with accusative, and nouns, as opposed to pronouns, with ergative.

Table 3 Nominal hierarchy

1st person
2nd person
3rd person
kin terms and personal names
human
animate
inanimate

In some languages there is a split between accusative and ergative on tense or aspect lines. A number of Indo-Aryan languages, including Hindi-Urdu (Literary Hindi), Marathi, and Punjabi (Panjabi), and some Iranian languages, such as Pashto and Kurdish, are described as having an ergative construction only in the perfect. Typical Indo-Aryan languages are described as having a direct/oblique case system where the direct case encodes S, A, and O and the oblique is governed by postpositions. However, if O is animate and specific, it is usually marked by a postposition. There is also subject-verb agreement, as in the following examples from Marathi:

(10) Ti keeḷ khaa-t-e.
she *banana* *eat*-PRES-3SG.F
'She eats a banana.'

(11) Ti Ravi laa chaḷ-ḷ-a.
she *Ravi* ACC *torture*-PRES-3SG.F
'She tortures Ravi.'

In the perfect, however, A is marked by a postposition. The verb agreement is with P unless P is marked by the postposition for specific, animate nouns, with the verb then remaining in its neutral form. In Marathi, the ergative postposition is *ni*.

(12) Ti ni keḷi khaa-ll-it.
she ERG *banana*.PL *eat*-PERF-3PL
'She ate bananas.'

(13) Ti ni Ravi laa chaḷ-ḷ-a.
she ERG *Ravi* ACC *torture*-PERF-NEUT
'She tortured Ravi.'

The postposition *laa*, glossed as ACCusative, marks indirect as well as direct objects.

Size of Case Systems

Some languages have no case system at all, and this is possible since there are alternative mechanisms. For the core relations, one alternative is to use word order. Subject and object are distinguished by the use of the unmarked word order subject-verb-object in a number of languages, including Thai, Cambodian (Central Khmer), and Vietnamese. This is also true of English, but English has vestigial two-way case system marked on most personal pronouns (*I/me*, *she/her*, *he/him*, *we/us*, and *they/them* but no distinction with *you* and *it*).

The other alternative for marking the core relations is to use some form of cross-referencing pronominal representation, usually on the verb or auxiliary

verb. The following example is from the northern Australian language Gunwinygu (Gunwinggu), in which the first person singular is represented as a prefix *nga-* on the verb and the third person plural by *-di-*. The *-n-* indicates that the first person is the object.

(14) Daluk ngaye nga-n-di-ma-ng.
*woman me 1sg-*OBJ*-3*PL*-get-*NONPAST
'The women will get me.'

In this example, the subject and object are represented independently of the verb, but they can be omitted, leaving a sentence meaning, 'They will get me.' The common situation in languages with cross-referencing bound pronouns is for the free pronouns to be used only for emphasis.

Where the function of bound pronominal markers is indicated by a change of form (affix or suppletion) as in Gunwinygu, the system seems to be case-like, and such systems certainly derive from the use of case marking. But there is an important difference. Bound pronominal systems represent grammatical relations, each set being in a one-for-one relationship with a grammatical relation. Cases are not always in a one-for-one correspondence with grammatical relations. If that were the situation, we would deal only in relations and the word forms or markers that express these relations. If, for example, the nominative forms in Latin expressed only subject, the accusative only direct object, the dative only indirect object, then we would talk of subject forms, direct object forms, and indirect object forms. There would be no need for the notion of case, just as there is no need for notional categories between tense markers and tense categories or aspect markers and aspect categories.

For the peripheral functions, the common alternative is the use of adpositions. Case systems, like other systems of grammatical forms, are normally relatively small. They range from two as in the Northwest Caucasian language Kabardian to 15 as in Finnish, but the number of relations a dependent noun can bear to a head will exceed these limits, mainly in the area of relative position ('under', 'over', 'behind', 'between', etc.). As a result, almost all languages use adpositions, whether they have peripheral cases or not. Where adpositions are used in addition to case markers, they form a kind of secondary system. However, in some languages, such as Japanese, postpositions are used to the exclusion of case affixes, even covering core functions. In the following Japanese example, the postposition *ga* marks the subject, *ni* marks the indirect object, and *o* marks the direct object:

(15) Sensei ga Tasaku ni hon o yat-ta.
teacher SUBJ *Tasaku* IO *book* DO *give-*PAST
'The teacher gave Tasaku a book.'

Adpositions can be considered to be analytic case markers as opposed to synthetic case markers. In Latin, which is fairly typical of languages having analytic as well as synthetic case markers, prepositions are like verbs in that they govern cases, and combinations of preposition and case suffix can serve to mark the relations of nouns to the verb. In English, all prepositions govern the accusative (*with me*, *from her*), but in some languages, different prepositions govern different cases. In Latin, some prepositions govern the ablative and others the accusative. The preposition *in* can govern both: in *casā* 'in the cottage', in *casam* 'into the cottage'.

In Malayalam, too, different postpositions govern different cases. *Mutal* 'from' governs the nominative in *mala mutal* 'from the mountain', *poole* 'like' governs the accusative as in *ammaye poole* 'be like mother', and *kuuɽe* 'through' governs the locative in *janalil kuuɽe* 'through the window'. Some postpositions such as *akattə* 'inside' govern the genitive as in *klassinre akattə* 'inside the classroom'. This reflects the noun origin of the postposition, where the genitive originally denoted the dependency of a noun to a noun (cf. English *at the side of the classroom*).

Given the availability of adpositions, it is not surprising that many languages have no peripheral cases. Where a language has the minimal number of cases, namely two, one finds an unmarked nominative and a marked accusative or marked ergative, which have other functions and could appropriately be called oblique. In the Uto-Aztecan language Chemehuevi, the nominative marks subject, and the accusative marks object and possessor. In the Kabardian, the absolutive marks the absolutive relation, and the ergative marks transitive subject and possessor. The absolutive relation embraces what from the standpoint of many other languages is intransitive subject and direct object. If a language has three cases, the third is usually genitive. If it has four, the fourth, whatever it is called, will tend to have a wide range of functions. German is typical in this regard. It has nominative, accusative, genitive, and dative, but dative is in fact a case with a wide range of functions, albeit governed by prepositions.

Where case systems are large, more than six or seven, the expansion is usually among the local cases. Finnish, for instance has 15 cases, including nine local cases. These are formed by markers for location, source, and destination, having partly fused with markers for interior and exterior, as shown in Table 4.

There are claims that the northeast Caucasian languages have case systems of over 40 members, but in these languages the orientation markers (for 'under', 'over', etc.) and the case markers proper are separate systems. The spectacular figures are obtained

Table 4 Finnish local cases

	Location	*Source*	*Destination*
Ø	*-na*	*-tta*	*-ksi*
	essive	partitive	translative
Interior	*-ssa*	*-sta*	*-(h) Vn, -sVVn*
	inessive	elative	illative
	'in'	'from(inside)'	'nto'
Exterior	*-lla*	*-lta*	*-lle*
	adessive	ablative	allative
	'at'	'from(outside)'	'to(wards)'

by counting combinations of orientation markers and case markers as members of one system. This is justified in Finnish where the markers cannot be identified consistently, but not, for the most part, in the Northeast Caucasian languages.

Types of Marking

Case marking is usually via suffixation. The only other mechanism that is at all common is suppletion, as with English pronouns (*I/me*, etc.). Case suffixes follow number marking; when pronominal possessors are marked on the noun, these usually appear before the case marking, as in Turkish, where they appear between the number marking and the case marking: *adam-lar–ım-la* (*man*-PL-1SG.POSS-LOC) 'with my men'; similarly in Hungarian: *hajó-I-m-on* (*ship*-PL-1SG.POSS-LOC) 'on my ships'. In the Balto-Finnic languages, however, the possessor marking usually follows the case marking. In Finnish, for instance, we find: *kirkolla-mme* (church-ADESSIVE-1PL.POSS) 'at our church'. The adessive case expresses the sense of 'near' or 'at'.

In some languages, including Indo-European case languages like Latin and Ancient Greek, case marking (actually case/number marking in these languages, as explained above) appears not only on nouns but also on certain dependents of the noun such as adjectives and determiners. The following example is from Plato. *Bios* is a nominative singular form of a second declension masculine noun, the nominative indicating that *bios* is the subject of the predicate. The definite article and the adjective are in the nominative singular masculine form, their concord in case, number,and gender indicating that they are dependents of *bios*.

(16) Ho anexetastos bios
the.NOM.SG *unexamined*.NOM.SG *life*.NOM.SG
ou biōtos anthrōpō.
not *livable*.NOM.SG *man*.DAT.SG
'The unexamined life is not livable for man.'

This example also illustrates concord between a predicative adjective (*biōtos*) and the subject (*bios*).

Besides concord within the noun phrase and concord exhibited by predicative nominals and adjectives, there is also apparent concord between what looks like separated parts of a noun phrase. In Latin, it is possible to take a word that would appear to modify a noun and express it in a phrase separate from the noun. The following example is from Virgil (*Aeneid* II:3),

(17) Infāndum, rēgīna, iubēs
unspeakable.ACC *queen*.VOC *order*.2SG
renovāre dolōrem.
renew.INF *sorrow*.ACC
'Unspeakable, [O] queen, [is] the sorrow you order [me] to rekindle.'

Here the gerundive adjective *infāndum* is displaced from the word it might be thought to modify, namely, *dolōrem*. In Australian languages, the noncontiguous expression of words that would normally appear within a single noun phrase in most languages is commonplace.

The other common pattern of case marking is for it to be found only on the final word in the noun phrase. We can distinguish two subtypes. In the first, the final word is the head noun in the noun phrase. This type is widespread. It is found, for instance, in Quechua. It is common among the Papuan languages, and there is a concentration of the type in Asia, including the Turkic, Mongolian, and Tungusic (Tungus) families north of the Himalayas, as well as the languages of the subcontinent, whether they be Dravidian, Munda, or Indo-Aryan (though a number of Indo-Aryan languages have vestigial concord). In this area, most languages are consistent modifier-head languages with SOV order at clause level and determiner-noun, adjective-noun order at phrase level. The following example is from the Dravidian language Kannada:

(18) Naanu ellaa maanava janaangavannu
I.NOM *all* *human* *community*.ACC
priitisutteene.
love.1SG
'I love all mankind.'

In the other subtype, the final word in the noun phrase is not always the head. This is the situation in various Australian and Amazonian languages. The phenomenon also occurs in Basque:

(19) etxe zaharr-etan
house *old*-PL.LOC
'in old houses'

In a few languages, a nominal can carry more than one case, each case with different scope, and often with different functions. Most but not all instances involve an inner layer of adnominal case plus an outer layer of concordial adverbal case, as in the following examples from Old Georgian:

(20) sarel-ita man-isa jta
name-INST *father*-GEN INST
'with father's name'

However, some Australian languages evince double adverbal case. In Warlpiri, for instance, a locally marked adjunct may take ergative case marking in a transitive clause. Consider the contrast between the following sentences. In (21a), the noun phrase in the role of destination is marked for allative case, as one would expect. However, if a verb for 'carry' is substituted for a verb meaning 'send', then it is possible to further mark the allative-marked phrase for ergative:

(21a) Ngarrka-ngku ka maliki
man-ERG PRES *dog*.ABS
ngurra-kurra yilya-mi.
camp-ALL *send*-NONPST
'The man is sending the dog to the camp.'

(21b) Ngarrka-ngku ka kuyu ka-nyi
man-ERG PRES *meat*.ABS *carry*-NONPST
ngurra-kurra (-rlu).
camp-ALL(-ERG)
'The man is carrying the meat to the camp.'

An inner local phrase normally has the patient as its scope (and this is normally encoded in the absolutive relation, i.e., as S or O). In Warlpiri, the use of the ergative on the locally marked phrase is to indicate that the agent (A) is also within its scope. With carrying, the agent moves to the same destination as the patient.

Where a clause rather than a noun phrase is a dependent, the same possibilities for the distribution of case marking arise. In most instances the case marker appears only on the head of the clause, namely the verb, as in the following example from Finnish, where the translative case is found on the infinitive. The translative means 'into', mainly metaphorically, as in 'You'll turn into a pumpkin', and purpose as in *mi-ksi* 'what for'. With a nominalised verb, it indicates purpose. The actor of the nominalised verb is expressed by the possessive pronominal suffix.

(22) Osti-n karttakirja-n suunnitella-kse-ni
bought-1SG *atlas*-ACC *plan*-TRANS-1SG.POSS
automatka-n.
car.trip-ACC
'I bought an atlas in order to plan a car journey.'

Another possibility is for the case marking of a dependent verb to spread to its dependents by concord. The following example is from Yukulta (Ganggalida) (Northern Australian). Note that the dative, which is appropriate to the verb *warratj-*, spreads to the allative-marked complement to yield a second layer of case marking.

(23) Taamitya-ngandi tangka
ask-1SG.3SG.FU.AUX *man*.ABS
natha-rul-ngkurlu warratj-urlu.
camp-ALL-DAT *go*-DAT
'I'll ask the man to go to the camp.'

In some languages there are different principles of case marking operating in subordinate clauses, particularly if the verb is non-finite. A well-known example is the use of the accusative for the subject as well as the object in Ancient Greek and Latin 'accusative and infinitive constructions'. The following example is from Latin, where *dominum*, the subject of the verb *vīdisse* is in the accusative as well as the object *cōnsulem*.

(24) Dicunt dominum cōnsulem vīdisse.
say.3PL *master*.ACC *consul*.ACC *see*.PERF.INFIN
'They say the master has seen [lit. 'to have seen'] the consul.'

In Thalantji (Pama-Nyungan), the dative, which is the main adnominal case in this language, is used to mark the complement of transitive verbs in non-finite relative clauses. Contrast the accusative on *kanyara* in the main clause and the dative on *murla* in the subordinate clause in (25):

(25) Ngatha nhaku-nha kanyara-nha
I *see*-PAST *man*-ACC
murla-ku warni-lkitha.
meat-DAT *cut*-REL.DS
'I saw the man (who was) cutting meat.'

The verbal suffix *-lkitha* in this example glossed 'relative, different subject' marks a qualifying clause, the covert subject of which must be interpreted as being distinct from the main clause subject. The marker is a case marker in origin. This is an example of a derived function of case marking.

In Turkish, the genitive is used to mark the subject of a nominalised verb. The object of such a verb if present takes the normal case marking.

(26) Ahmed-i ben-i sev-diğ-in-i
Ahmed-GEN 1SG-ACC *love*-NM-3SG.POSS.ACC
bil-iyor-um.
know-PRES-1SG
'I know that Ahmed loves me.'

The form *-in* is a third singular possessive form in cross-reference with *Ahmed-i*. In Turkish, noun possessors are cross-referenced on possessed nouns: *Biz-im heykel-imiz* (we-GEN statue-1PL.POSS) 'our statue'. The accusative on the nominalised verb marks it as the complement of *biliyorum*, and the accusative on *ben* marks it as the complement of *sevmek* 'to love'.

Case Grammar

J M Anderson, Methoni Messinias, Greece

© 2006 Elsevier Ltd. All rights reserved.

'Case Grammar' is a label used for various developments in grammatical theory originating in the mid-to-late 1960s that are associated more or less closely with a certain hypothesis concerning the organization of the grammar: the hypothesis concerns the status of semantic functions – or relations or roles – such as Agentive or Locative; functions that label the mode of participation of the denotata of arguments in the situation described by the predication in which they occur. The terms 'various' and 'more or less closely' are used advisedly. Since Case Grammar is a partial hypothesis, it is compatible with a variety of hypotheses concerning other aspects of the grammar, though it will, of course, interact with them. Since, too, the hypothesis can be formulated in more and less strong forms, not all variants of Case Grammar are as distinct in their claims from what is embodied in other frameworks that are not usually termed Case Grammars. The minimum Case Grammar hypothesis is that semantic functions are relevant to the expression of syntactic (as well as semantic) generalizations; in a stronger, more interesting and distinctive form it involves the claim that they are basic to the syntax and that many other aspects of syntactic structure are derivative of them.

The name itself is in part a recognition that what is involved is, again in part, a return to traditional concerns with the semantics and syntax of Case (*see* **Case**), concerns that were neglected by those structuralist (including early transformational) frameworks that abolished the morphology/syntax division and were reticent about semantics. The term 'Case Grammar' specifically devolves from Fillmore's (1965, 1966, 1968a) use of Case Relation, or simply Case, for semantic function, the status of which is fundamental to the Case Grammar hypothesis. In what follows, the first section outlines some of the basic notions central to the main tradition associated with this hypothesis; while the second and third sections give some idea of, respectively, the variety of interpretation to which it has been subjected and the range of attempts to arrive at a definition of Case and Cases.

Some Fundamentals

The use of the term 'Case (Relation)' for semantic function is based on the familiar observation that in a number of languages semantic functions are distinguished by differences in nominal inflexion, as in the Old English sentence of (1):

(1) Him ofhreow þæs mannes
'He/they+dat pitied the+gen man+gen'

(cf. again *see* **Case**), wherein the dative inflexion signals the locus of the emotion denoted by the verb (discussed below as the Experiencer Case Relation) and the genitive inflexion marks the Source of the emotion.

However, it must be acknowledged, as is once more familiar from earlier studies (cf. e.g., Welte, 1987), that in many instances the correlation between case inflexion and semantic function is not simple. Most notoriously, case inflexions can correlate more closely with grammatical functions or relations. Notably, most grammarians would not include Subject among the set of semantic functions. At the very least, it is of a rather different character from Agentive, etc.; hence its differentiation, along with (for many grammarians) Object, etc. as a grammatical relation. The

Case Grammar

J M Anderson, Methoni Messinias, Greece

© 2006 Elsevier Ltd. All rights reserved.

'Case Grammar' is a label used for various developments in grammatical theory originating in the mid-to-late 1960s that are associated more or less closely with a certain hypothesis concerning the organization of the grammar: the hypothesis concerns the status of semantic functions – or relations or roles – such as Agentive or Locative; functions that label the mode of participation of the denotata of arguments in the situation described by the predication in which they occur. The terms 'various' and 'more or less closely' are used advisedly. Since Case Grammar is a partial hypothesis, it is compatible with a variety of hypotheses concerning other aspects of the grammar, though it will, of course, interact with them. Since, too, the hypothesis can be formulated in more and less strong forms, not all variants of Case Grammar are as distinct in their claims from what is embodied in other frameworks that are not usually termed Case Grammars. The minimum Case Grammar hypothesis is that semantic functions are relevant to the expression of syntactic (as well as semantic) generalizations; in a stronger, more interesting and distinctive form it involves the claim that they are basic to the syntax and that many other aspects of syntactic structure are derivative of them.

The name itself is in part a recognition that what is involved is, again in part, a return to traditional concerns with the semantics and syntax of Case (*see* **Case**), concerns that were neglected by those structuralist (including early transformational) frameworks that abolished the morphology/syntax division and were reticent about semantics. The term 'Case Grammar' specifically devolves from Fillmore's (1965, 1966, 1968a) use of Case Relation, or simply Case, for semantic function, the status of which is fundamental to the Case Grammar hypothesis. In what follows, the first section outlines some of the basic notions central to the main tradition associated with this hypothesis; while the second and third sections give some idea of, respectively, the variety of interpretation to which it has been subjected and the range of attempts to arrive at a definition of Case and Cases.

Some Fundamentals

The use of the term 'Case (Relation)' for semantic function is based on the familiar observation that in a number of languages semantic functions are distinguished by differences in nominal inflexion, as in the Old English sentence of (1):

(1) Him ofhreow þæs mannes
'He/they+dat pitied the+gen man+gen'

(cf. again *see* **Case**), wherein the dative inflexion signals the locus of the emotion denoted by the verb (discussed below as the Experiencer Case Relation) and the genitive inflexion marks the Source of the emotion.

However, it must be acknowledged, as is once more familiar from earlier studies (cf. e.g., Welte, 1987), that in many instances the correlation between case inflexion and semantic function is not simple. Most notoriously, case inflexions can correlate more closely with grammatical functions or relations. Notably, most grammarians would not include Subject among the set of semantic functions. At the very least, it is of a rather different character from Agentive, etc.; hence its differentiation, along with (for many grammarians) Object, etc. as a grammatical relation. The

inflexions identified by the label nominative in various languages are labeled thus precisely because their occurrence correlates most closely with the nominal identified on other grounds as a Subject.

Further, apart from the fact that case inflexions typically express other categories simultaneously with case (or grammatical) relations, categories such as gender, number, dimensionality, distinctions in Case Relation are frequently expressed otherwise than by nominal inflexion. Typically, as well as or instead of noun inflexions, adpositions, verbal auxiliaries, word order, verb morphology, and combinations of these may be involved, often in combination in the same language.

Consider, for example, the sentences from Eastern Pomo in (2):

(2a)	mí·p̓	békal du·léya
	he	them killed
(2b)	bék^h	mí·pal ša·k̓akiya
	they	him killed
(2c)	mí·p̓	kaluhuya
	he	went-home
(2d)	bék^h	kálp^{h}i·líya
	they	went-home
(2e)	békal	c̓e·xéka
	they	slipped

The shape of the pronoun reflects whether it is Agentive or not: *mí·p̓* and *bék^b* are Agentive, they mark the Source of the Action, both in the transitive examples (2a, b) and the intransitive (2c, d); but *mí·pal* and *békal* signal the entity undergoing the action or process, what I will describe below as an instance of the Neutral Case Relation, both in the transitive examples (2a, b) and in the intransitive (2e). Typically, too, the suppletion illustrated in (2a, b) – the 'kill' verb changes its shape – is in response to the number of the Neutral ('them' vs. 'him'). However, in (2c, d) the (partial) suppletion is triggered by the number of the argument we have already (on the basis of the correlation between semantic function and pronoun morphology) labeled Agentive. This would seem to confirm that the pronouns in (2c) and (2d) are simultaneously Agentive and Neutral, as both are Source of the Action and undergoer of it (and thus moving), whereas that in (2e) is Neutral simply. We return to the association between argument and Case Relation in 'Defining Case Relations.' What is most relevant at this point is illustrating the interaction of different means of expressing Case relations.

There is typically, too, with respect to a specific language, no one-to-one correlation between a particular Case Relation and a particular expression, whether by inflexion, adposition or whatever. Despite occasional claims to the contrary, the English preposition *by*, for instance, is not associated uniquely with Agentives, or *to* with Goals: both can also mark what is often labeled Experiencer (*known by/to*). Nevertheless, given that the expression of distinctions in Case Relation may be regarded as the prototypical function of case inflexions, this 'case' terminology is not unjustified. And its appropriateness is reinforced to the extent that grammatical relations can be regarded as neutralized Case Relations.

Such a notion is crucial to the strong Case Grammar framework developed by Charles Fillmore in the late 1960s. This substituted for the Deep Structure of a grammar of the type envisaged in Chomsky's (1965) basic representations including nodes associated with a set of Case Relations. Both Surface Structures of (3), for example, are derived from the (unordered) Deep (Case) Structure of (4).

(3a)

(3b)

(4)

The Proposition consists of a verb and a set of Case Phrases, each of which includes a Case 'flag' (Kasus) and a Noun Phrase. The Agentive is the source of the action; the Neutral is the least specific Case, whose precise relation to the predicate is most obviously dependent on the type of the predicate: it labels the

entity that undergoes processes and movements and actions and has locations and states attributed to it. 'Defining Case Relations' discusses more fully the definition of the Cases; but notice at this point that N(eutral) appears under a number of different labels: Ergative (an acknowledged misnomer), Object(ive), Nominative (again, unfortunate), Absolutive, Patient (usually interpreted more narrowly than Neutral). Modality consists of elements of tense, mood, and aspect, including Modal Cases (such as Manner Phrases), which are interpreted as modalities of the sentence as a whole.

Predicates, such as the verb in (3) and (4), are subcategorized not in terms of their functionally unlabeled complements, but with respect to the set of Case Phrases they require, obligatorily, or optionally, as exemplified in (5a) and (5b), respectively:

(5a) + [_____ N(eutral) A(gentive)]
(5b) + [_____ N (A)]

The verb of (5a) (perhaps *kill*, if we ignore Instrumentals, such as *with a handbag*, for the moment: see again 'Defining Case Relations') is marked as taking a Neutral and an Agentive. That in (5b) takes a N and an optional A, perhaps appropriate for *melt*: see (8) below.

Assignment of the status of Subject is based on the set of Case Phrases present in a sentence, the Case Frame. Each entry in (5) includes a set of Case Frame Features. Unmarked assignment in a particular predication is specifically in accord with a Hierarchy of Case Relations, as exemplified by (6) (Fillmore, 1968a):

(6) Agentive > Instrumental > Objective

In terms of (6), an Agentive, if present, will be Subject; in the absence of an A, then an Instrumental, if present, will be; and so on. With *kill*, the Agentive thus takes priority, as in (3a). The Surface Structure of the passive sentence in (3b) contains signals (the auxiliary construction) that here the Hierarchy has been overridden, a marked selection of Subject has been made, and the 'rejected' subject is distinguished by an appropriate marker (here *by*).

There has been some controversy over the character of the Hierarchy, partly as a result of different views concerning the set of Cases, as discussed in 'Defining Case Relations' below. It may be too that lexical exceptions to the Hierarchy have to be acknowledged. For instance, if *like* and *please* in English are associated with the same set of Case Frame Features, then one of them will apparently have to be marked as exceptional in Subject selection:

(7a) Jemima liked the play
(7b) The play pleased Jemima

whatever the hierarchy, if it is determinate. Anderson (1977: Sect. 2.1.5) and others have denied that this is necessary, in that the two verbs require different sets. Grimshaw (1990) suggests that such pairs as (7) differ 'aspectually.' But even if such exceptions have to be countenanced, the viability of some such hierarchy is the basis for the strong Case Grammar hypothesis, which asserts the basicness of Cases and the dependence thereon of other syntactic phenomena (including Subject selection).

It has also been argued that conventional Deep Structures (as introduced in Chomsky, 1965), as well as being derivable, and indeed dispensable, also form a poor basis from which to project (Deep) grammatical relations, one of their claimed roles: configurational definitions are difficult to maintain across languages; they allow for spurious (or at least never utilized) grammatical relations; and some categories seem themselves to be relational (e.g., Place). Moreover, the role of Deep relations in the grammar (pace Katz, 1972) remains obscure. See here, for example, Anderson, 1977: Sect. 1.2, 1982; Starosta, 1987. And, that argument proceeds, neither Deep Structures nor grammatical relations are relevant to lexical relationships.

Fillmore's work on Case Grammar and beyond has involved a strong interest in lexical semantics (see particularly Fillmore, 1987; also, in the present context, Fillmore, 1968b, 1970, 1971b, 1971c, 1972, 1977a, 1977b). Much effort within Case Grammar has been devoted to showing that subcategorization and lexical relations are sensitive to Case Relations rather than the configurations and grammatical relations that are derivative in CG. So-called ergative verbs (Lyons, 1968) appear to provide a straightforward example with respect to subcategorization. Case Grammarians have argued that the basic distributional potential of verbs such as *melt* in (8) is most transparently described in terms of the Case Features of (9) rather than, say, the conventional frame of (10):

(8a) Burt melted the ice
(8b) The ice melted

(9) N (A)

(10) + [___ ([NP])

Example (10) can be said to obscure what is constant in the two basic occurrences, the Neutral (Objective) argument, with selection of Subject being determined by the Hierarchy. Anderson (1984) attempts to show that a wide range of (lexical) derivational relationships in English make no reference to grammatical relations or the configurations in terms of which they may be defined.

Typical here is *-able* formation, whose central function is to form adjectives of a certain semantic character on the basis of verbs, such that the argument of the adjective corresponds to the Neutral argument of the verb (whatever its grammatical relation); we again have the familiar 'ergative' relation, illustrated in (11) and highlighted therein by the derivational pattern associated with a verb such as *change*:

(11a) The cover is removable (cf. Beppo has removed the cover)
The settings are changeable (cf. Beppo has changed the settings)
(11b) The material is perishable (cf. The material has perished)
The weather is changeable (cf. The weather has changed)

Reference to grammatical relations again obscures the generalization. The import of this is that if the lexicon (via subcategorization and derivational relationships) has access only to basic syntactic structure, then grammatical relations and the division into Subject and Objects do not appear to be basic: this is exactly what is claimed by the Case Grammar hypothesis.

This conclusion can be avoided, with respect to examples such as (8) and (11), at least, if one adopts the Unaccusative hypothesis associated with developments of Relational Grammar and other frameworks. In terms of this hypothesis, the Surface Subjects of (8a) and (11a) are initial Direct Objects; their subjecthood is derivative only. (Other intransitive verbs [typically Agentive] do have initial Subjects; they are Unergative.) The relationships in (8) and (11) can then be described without reference to Case Relations: for example, 'ergative' verbs are transitives with an optionally empty subject; the derivational relationship illustrated by (11) involves uniformly the Direct Object of the base verb. Case Grammarians have argued that such a strategy lacks independent motivation, is unnecessary given the availability of Case Relations, and leads to incorrect predictions (cf. e.g., Anderson, 1980).

Such arguments have also been concerned to show not only that grammatical relations are derivative ('Surface') but also that it is inappropriate to attribute subjecthood at all to certain language types, if a definition of Subject more restrictive than 'obligatory derived relation' is to be maintained. In most languages, Subject is a syntactically motivated grouping (or neutralization) of transitive Agentives and intransitive Neutrals (cf. [8] again). In the ('ergative') Dyirbal language of Australia, such a grouping is at most only marginally relevant from a syntactic point of view. (Direct) Objecthood is also notoriously difficult to identify; and it has been argued that Indirect Object is an incoherent relation, even derivatively (Anderson, 1978, and see more recently S. R. Anderson, 1988).

Throughout the late 1960s and the early 1970s, various different versions of Case Grammar were proposed, to some extent independently (e.g., apart from the work of Fillmore: Anderson, 1968, 1971; Platt, 1971; Cook, 1971, 1972a, 1972b, 1973, 1978; Nilsen, 1972; Longacre, 1976; cf. also Chafe, 1970), and the framework inspired a number of descriptive and applied studies. However, little agreement on the set and nature of the set of Case Relations emerged (see further 'Defining Case Relations' below). It also became clear that Case Grammar was vulnerable to the charge that, apart from the claimed prediction of the distribution of grammatical relations and associated word order properties, little evidence of a syntactic role for Case Relations was adduced. Thus, for example, the Case-based lexicon of Stockwell *et al.* (1973) plays almost no role in the syntactic descriptions that occupy the rest of the volume.

Even more seriously, perhaps, evidence was put forward, on the other hand, for the semantic and syntactic relevance of Deep grammatical relations and for the necessity of positing the kind of relation between active and passive sentences prescribed by the Passive transformation, which was eliminated from the syntax by Fillmore's (1968a) proposals.

Crucial here is the discussion of the role of grammatical relations by S. R. Anderson (1971). Pairs of sentences such as those in (12):

(12a) Ernie loaded the pickup with packs of amaretti
(12b) Ernie loaded packs of amaretti onto the truck

differ in interpretation: the former has been described as 'holistic,' the action exhausts the relevant dimensions of space denoted by the Direct Object; the latter is 'partitive.' If (12a) and (12b) share Case Features (say Agentive, Neutral, Place), then the basis for the difference must be located elsewhere. It is not a property of Surface Structure; the difference remains constant under various transformational movements, as illustrated by (13) and (14):

(13a) The pickup was loaded with packs of amaretti
(13b) Packs of amaretti were loaded onto the truck

(14a) It was packs of amaretti that Ernie loaded the truck with
It was the pickup that Ernie loaded with packs of amaretti
(14b) It was packs of amaretti that Ernie loaded onto the pickup
It was the pickup that Ernie loaded packs of amaretti onto

What the (a) variants share is Deep Structure association of the Place Case Relation with Direct Object function. Their derivations must include a stage at which this association is made, motivating both Passive as a transformation and Deep Object. (This is, of course, not to deny that, given appropriate assumptions, this association could be read off derived structures.) Fillmore (1977a) concedes the force of this argument, and essentially reinstates Deep Structure, thereby effectively abandoning the Case Grammar hypothesis in its strongest form. Others have disagreed.

It is possible, for instance, that Passive may be accommodated constructionally, as bi-clausal (see 'Varieties of Case Grammar' below). But even if that possibility is laid aside, it can be argued that the Case Feature assignments assumed above are inappropriate, that they differ between the (a) and (b) examples. Miller (1985) suggests that the association of nonsubjective arguments to Case Relations is reversed between (a) and (b); J. M. Anderson (1977: Sect. 1.8) accepts that the (a) and (b) examples share the same Case Features and the same associations, but suggests that in addition the Place argument in the (a) examples is simultaneously Neutral: i.e., it bears two Case Relations. (On this see 'Defining Case Relations' below.) Under either proposal, we can associate holisticness, as elsewhere, with the Neutral Case Relation: unless this expectation is canceled in some way, Neutrals are normally understood as participating as a whole in the process being represented. This is true of the Neutrals in (1b) and (12b), for instance.

J. M. Anderson also points out that the generalization based on Deep Object is inadequate. The Subjective Place argument in (15a) but not (15b) is also associated with a holistic interpretation:

(15a) The garden is swarming with bees
(15b) Bees are swarming in the garden

He attributes this to the Place in (15a) being again simultaneously Neutral, which is also associated with its selection as Subject. Once more, (12) and (15) show the 'ergative' (or, more misleadingly, 'unaccusative') pattern that cuts across grammatical relations.

The syntactic role of Case Relations has been variously addressed since the mid-1970s. The force of objections based on the paucity of reference by transformations to Case Relations has been considerably weakened by the apparent demise of individual transformations. For instance, the motivations for a syntactic relationship between pairs such as that in (16), involving a putative Dative Movement, are disputable, where evident:

(16a) Anna taught Helen Greek
(16b) Anna taught Greek to Helen

These pairs can be argued to show a partially shared Case Frame, with the difference in word order being attributable to the differences in Case Relations present (cf. again Anderson, 1978; also Anderson, 1987). The difference in Case Frame is reflected in the contrary acceptabilities of (17a) and (17b):

(17a) *Anna taught an empty room Greek
(17b) Anna taught Greek to an empty room

The *Helen/empty room* argument is involved in the action in a different way in the (a) and (b) examples, suggesting a difference in Case Relation (on the possible character of this difference, once more involving an argument being assigned more that one Case Relation, see again 'Defining Case Relations' below).

More generally, the development of frameworks in which transformations are reduced to a small number, including one, or from which they are eliminated altogether, poses the question of the syntactic relevance of Case Relations in a different way – or rather different possible ways. This is one respect in which different variants of Case Grammar have evolved in response to decisions about other aspects of the grammar than are encompassed by the basic Case Grammar hypothesis.

Varieties of Case Grammar

Fillmorean Case Grammar evolved as an alternative to the kind of transformational grammar expounded in Chomsky (1965), with subject formation instated as one of a number of transformational rules. Anderson (1968, 1971) talks of rules of realization (including 'sequencing'), implying nontransformational mapping of (unordered) Case structures onto surface structures enriched with sequence and configurations; but only a very limited range of constructions is taken into consideration there. And Anderson (1977) envisages complex (transformational) derivational relationships between initial unordered structures and Surface, including prelexical application of syntactic rules (cf. similar developments over the same period within Generative Semantics (*see* **Generative Semantics**).

Partly in reaction to such developments, Starosta (1973, 1978, 1987, 1988) and others have formulated a framework, Lexicase (*see* **Lexicase**), which eschews transformations, and, indeed, syntactic derivations altogether. Syntax is monostratal and Case Relations and Case Forms (including case inflexions) are marked as features on lexical items, the former on nouns, the latter on nouns, verbs, and prepositions. Thus, corresponding to (3) and (4) above we might have (18), with no Deep/Surface distinction (modeled on Starosta, 1987: 65):

(18a)

(18b)

AGT and PAT are Case Relation features, roughly corresponding to A and N; Nom, Acc, Sorc, and Goal are Case Form features. The relationship between the [+AGT] noun in (18a) and the Means ([+MNS]) noun in (18b) is expressed by the rule of lexical derivation that forms the adjectival verb in (18b) from the transitive verb in (18a). Corresponding to the Case Frame Features discussed above, we have Contextual Features such as [+[+AGT]] and [+[+PAT]] associated lexically with predicates. Contextual Features may be either inherent or given by lexical redundancy: e.g., all verbs are redundantly [+[+PAT]] (what Starosta refers to as Patient Centrality: see 'Defining Case Relations' below). The Subject Selection Hierarchy is also expressed by lexical redundancies such as (19) (Starosta, 1987: 67):

$$(19)\quad [+[+AGT]] \quad \rightarrow \quad \begin{bmatrix} +[+PAT] \\ \quad [+Nom] \\ -[-AGT] \\ \quad [+Acc] \\ -[-PAT] \end{bmatrix}$$

Example (19) requires that an item that occurs with a [+AGT] must also occur with a [+PAT] (generalizable as Patient Centrality), and also that the [+AGT] is [+Nom], Subject, and the [+PAT] is [+Acc], Object.

In general, the grammar is reduced to what can be expressed via relationships between individual lexical items, though the status of long-distance dependencies remains uncertain. We should note too that some critics have found it difficult to see how basic word order settings (such as Head-Modifier vs. Modifier-Head) can be regarded as part of the lexicon.

It is still possible within such a restrictive framework to reconstruct the fundamental basis for the Case Grammar hypothesis, the primacy of Case Relations vis-à-vis Case Forms; specifically, in terms of redundancies such as that in (19). But lexical primacy of Case Relations is a property shared by a number of other proposals, such as those made within the tradition of Functional Grammar (*see* **Functional Grammar: Martinet**), as developed by Dik (1978; also 1987) and others. Are these also Case Grammars? Starosta himself describes various Valency Grammars (*see* **Valency Grammar**) as such. This is to some extent a terminological matter. However, the central thrust of work in Case Grammar (what was called above the strong hypothesis) has involved the syntactic primacy of Case Relations and the exclusion of grammatical relations, etc. from the lexicon (cf. 'Some Fundamentals' above). Other developments suggest that this can be maintained within a restrictive theory that nevertheless does not abandon the syntax/lexicon division.

The descriptions proposed by Anderson (1977) involve complex syntactic derivations. But they are conceived of as resulting from the interaction of a small number of universal syntactic rules, and possibly only one involving structure change (Raising), regulated by universal constraints, such as Strict Cyclicity. Roughly, in terms of this last, cyclic structure-changing rules must apply only in derived (nonmonoclausal) environments or in an environment resulting from the application of a cyclic rule. Thus, a derivation whereby the Subject of the finite verb in (20) is Raised out of a subordinate clause, conforms to Strict Cyclicity:

(20) Fran seems to like cheese

whereas monoclausal rules such as Dative and the traditional Passive, whether interpreted as movements or relation changes, are illegitimate. Such a requirement outlaws all the Advancements of Relational Grammar, for instance, if conceived in derivational terms. Raising, indeed, it has been argued (e.g., Anderson, 1982, 1984, 1986), provides a paradigm instance of the syntactic role of Case Relations and of the appropriateness of the strong Case Grammar hypothesis.

In (20), the Raised Subject of the (nonfinite) subordinate clause assumes the Subject function in the main (cyclic) clause. In (21) the Raised Subject becomes the Object of the finite verb:

(21) Nobody expected Fran to like cheese

(Such a formulation clearly rejects attempts to deny such a [derived] status to the *Fran* argument in [21].) The derived relations involved present us with a familiar pattern of distribution, that labeled 'ergative.' The status of Subject in (20) and Object in (21) is exactly what one would expect of a Neutral argument; in (21), it is denied subjecthood by the Experiencer argument of the finite verb. Raising confers the Neutral Case Relation in the cyclic clause on the Subject argument of the subordinate verb.

Formulations of Raising invoking grammatical relations or configurations, once again, obscure this generalization. More interestingly still, this interaction of relations is as predicted by the Case Grammar hypothesis. The identification of grammatical relations is derived, determined by the Hierarchy; thus, the identity of the Subject of the cyclic clause is not available on the cycle of rules applying to that clause (in the absence of an arbitrary ordering of rules); but, if the Subject is identified cyclically, then its identity is available on the next cycle. This is exactly what the formulation of Raising requires: the argument involved is identified as the Subject of the lower clause (now available, on the Raising cycle) and as Neutral (a Case Relation) in the cyclic clause; its grammatical relation in the upper clause is given by the Hierarchy. Indeed, if this argument had to be identified in the formulation of Raising by its grammatical relation in the cyclic clause, such a formulation would stand as a counter-example to the predictions of the Case Grammar hypothesis.

Dative and Passive, also, in so far as they involve manipulation of derived properties within a single clause, also violate the Case Grammar hypothesis, as they do Strict Cyclicity. The two hypotheses converge in excluding them as monoclausal rules. The Dative relationship with examples such as (16) can be allowed for in terms of partially shared Case Features. Such an account is not available, however, for Passive. But as an alternative to the lexical proposal described above, a cue can be taken (as it has been in a number of approaches) from the overtly two-verb structure involved.

Say (Passive) *be* is a Raising verb, and its Subject is Raised out of the subordinate clause associated with the accompanying nonfinite (e.g., Anderson, 1991). It differs from a Raising verb like *seem* only in that the Raised argument is not the Subject of the nonfinite verb; rather, it is the argument next down on the Subject Selection Hierarchy. This stipulation allows for all of (22), with the boundaries of the subordinate clause marked by square brackets):

(22a) Albert was [killed by Emma]
(22b) That was [known by/to everybody]
(22c) The bed was [slept in by a parrot]

In each instance, the Hierarchically highest argument (Agentive, Experiencer, Agentive/Neutral, respectively) is ignored by Raising, and is marked with a preposition characteristic of the Case Relation involved. (On the Agentive/Neutral assigned to (22c) see 'Defining Case Relations' below.)

More recently, it has been claimed (cf. again Anderson, 1991) that Raising (including Passive) is projectively structure-building; more generally, that syntactic structure is built up monotonically on the basis of the valencies (specified crucially in terms of Case Relations) of individual lexical items. Such developments serve to enable us to bring into sharper focus the differences between the lexical Case Grammar advocated by Starosta and the tradition within which Case Relations are seen as syntactically basic.

Crucially involved is the validity of a syntactic/lexical distinction. Advocates of the distinction (e.g., Anderson, 1984) argue, for instance, for a differentiation between syntactic and lexical passives (derived adjectives); it is unclear how, if legitimate, this distinction is to be reconstructed in purely lexical terms. Another central question for the lexical approach (apart from those mentioned above) is: how are the alleged asymmetries between the roles of Case Relations and Case Forms to be accounted for? This involves both the syntactic asymmetry associated with Strict Cyclicity (deployed in the description of Raising given above) and the lexical asymmetry associated with the claimed failure of lexical rules to make reference to Case Forms.

Case Grammar approaches (including perhaps Functional Grammar) are united in highlighting the Contrastive status of Case Relations: they have to be stipulated lexically. Many other aspects of syntactic and lexical structure are redundant, derivative of Case specifications and e.g., parametric settings for basic word order. The Case Relations are also semantically identified, though distributionally distinctive.

Such a view has been influential in the evolution of other, distinctively labeled frameworks, such as Role and Reference Grammar (*see* **Semantics in Role and Reference Grammar**). In the main line of development in transformational grammar (epitomized by Chomsky, 1972, 1981, 1995), the Case Grammar hypothesis was initially rejected, but over time transformational syntax came to embrace Case

Relations (under the unfortunate name of Thematic Relations, or Theta Roles), and eventually to abandon Deep Structure. In these respects, the Minimalist program can be identified as a variant of Case Grammar. On the other hand, Anderson (1989, 1991, 1997) and Böhm (1998), in view of the semanticity of the Case Relations, see Case Grammar as a subpart of Notional Grammar, wherein all the basic elements of the syntax, including word classes, though distributionally motivated, are identified on the basis of semantic properties displayed by their prototypical members.

As 'Varieties of Case Grammar' has in part illustrated, other aspects of Case Grammar have been much more contentious. To some extent, this reflects choice among theoretical alternatives relatively independent of the Case grammar hypothesis. Independence of hypotheses within grammatical systems, however, is only ever relative. Thus, whereas Fillmore (1968a, 1971a) remains rather undecided concerning the appropriate representation of syntactic structures including Cases, others (e.g., Robinson, 1970; Anderson, 1971; Tarvainen, 1987, and cf. Tesnière, 1959) have argued that Case Relations, specifically, are most appropriately expressed by Dependency structures (*see* **Dependency Grammar**). In terms of the framework of Anderson, 1971, for instance, (23) would correspond to (4), with Case nodes dependent on the V(erb) and governing the N(oun); Erg = Ergative (roughly, Agentive; see 'Defining Case Relations') and Nom = Nominative (Neutral):

(23)

The correlation between the dependency hypothesis, and other aspects of syntax, and the Case Grammar hypothesis itself is controversial. But perhaps the least agreed-on aspect of Case Grammar has been the constitution of the set of Case Relations themselves, an issue that remains unresolved. And the characterization of these in turn has consequences for these other issues concerning the parameters of a Case Grammar.

Defining Case Relations

The arguments of a predicate identify the entities involved in the situation described by the predicate. The nature of the roles played by these entities can be discriminated in more or less detail. In a sense, each predicate prescribes a unique set of roles. But it is possible to generalize over various 'fields' of the vocabulary; and in certain institutionalized situations, in particular, these roles are made lexically explicit in the language. Thus, in the situations described by English verbs such as *sell*, *buy*, *barter*, etc., one role is occupied by a Customer; in those described by *concede*, *justify*, *accuse*, etc., there occurs a Defendant, perhaps (see e.g., Fillmore, 1971c, 1972: Sect. 42, 1977b). More generally still, we can recognize that in many situations it is possible to attribute to a particular entity the role of Source of the Action, the Agentive role.

The Customer in (24a) and the Defendant in (24b) are both Agentive, as Sources of the immediate Action described by the verb:

(24a) Algernon bought a Lada from Bert
(24b) Algernon justified his decision unconvincingly

However, there is no simple mapping between such generalized roles and the more specific institutionalized functions. The Customer in (25), for instance, is not presented as the Source of the immediate Action:

(25) Bert sold a Lada to Algernon

even though the same 'real-world' event may be being referred to by (24a) and (25). This observation undermines such critiques as that offered by Dowty (1989). Dowty's program for eliminating Case Relations from the syntax has been pursued, however, in various ways, as in the tradition exemplified by Hale and Keyser (2002), generally at the cost of acceptance of a very abstract view of syntax and of the syntacticization of lexical structure.

Much of Fillmore's work since the early 1970s has been concerned with the cognitive structures, Frames (*see* **Frame Analysis**), within which detailed role specifications are articulated. However, it is generalized roles such as Agentive that Case Grammarians identify as Case Relations, those semantic functions that are basic to the lexicon and/or syntax. There has been some agreement, and much disagreement, concerning the set of roles that fulfill this function in the grammar. (For a survey of early work see Somers, 1987.)

The set of Case Relations offered in Fillmore (1968a) was tentative and not intended as necessarily exhaustive; he suggests (Fillmore, 1968a: 24–25):

- Agentive (A), the case of the typically animate perceived instigator of the action identified by the verb;
- Instrumental (I), the case of the inanimate force or object causally involved in the action or state identified by the verb;
- Dative (D), the case of the animate being affected by the state or action identified by the verb;
- Factitive (F), the case of the object or being resulting from the action or state identified by the verb, or understood as a part of the meaning of the verb;
- Locative (L), the case that identifies the location or spatial orientation of the state or action identified by the verb;
- Objective (O), the semantically most neutral case, the case of anything representable by a noun whose role in the action or state identified by the verb is identified by the semantic interpretation of the verb itself; conceivably the concept should be limited to things that are affected by the action or state identified by the verb.

Other possibilities are mentioned elsewhere. Fillmore (1971b: Sect. 4) proposes a rather different set as "the case notions that are most relevant to the subclassification of verb types": it includes a Counter-Agent, and splits the Dative into various other Cases, including a new one, the Experiencer (see further below). Fillmore (1971a) contains a slightly different list, in particular lacking Result (regarded there as a Goal) and Counter-Agent and including Location, Time, and Path.

Starosta (1988) suggests a set somewhat reduced compared to his and Fillmore's earlier proposals. Cook (1978: 299), for instance, proposes only Agent, Experiencer, Benefactive, Object, and Locative, while Longacre (1976: 27–34) has Experiencer, Patient, Agent, Range, Measure, Instrument, Locative, Source, Goal, and Path. These sets at least show some overlap; much less of this is evident in, for example, the rather more exotic set proposed by Tarvainen (1987). Such uncertainty over the set of Cases, also well illustrated by the introductory discussion to the sample lexicon of Stockwell *et al.* (1973: Chap. 12, Sect. II.A), has often been cited in criticism of the Case Grammar framework (e.g., Chapin, 1972). It might, indeed, be regarded as a sign of lack of responsibility to describe a particular Case as a 'wastebasket' (Fillmore, 1971a: 42). Unless a theory of Case is properly constrained, new Cases are liable to crawl out of (or be rescued from; Radden, 1978) the 'wastebasket' or from even less desirable spots.

It should, however, be pointed out that the same challenge, or problem, confronts any framework that includes semantic functions or thematic roles (Gruber, 1965; Jackendoff, 1983, and descendants), whose status (as already implied) is now seen by a number of non-Case Grammarians as central to the grammar (cf. e.g., the discussions and references in Wilkins, 1988). Moreover, the determination of the set of syntactic categories as a whole remains contentious. How, for instance, does one group and hierarchize the classes indicated by the labels universal quantifier (e.g., *all*), distributive quantifier (*every*), existential quantifier (e.g., *some*), adjectival quantifier (e.g., *many*), quantificational adjective (e.g., *numerous*, *various*), cardinal numeral, ordinal numeral, superlative adjective, . . . (see e.g., Anderson, 1989)?

On the other hand, this Defendant has to concede that the resolution of the question of the constitution of the set of semantic functions is rather more crucial for a framework in which they play such a fundamental role as is advocated by Case Grammarians. Thus, much effort has been devoted within Case Grammar not merely to the establishing of definitions and semantic/syntactic properties of the individual Cases (cf. e.g., Fillmore's [1972: Sect. 32] discussion of Experiencer and *personally*), but also to the formulation of general principles governing the distribution of Cases and (less commonly) of a general substantive theory of the category of Case.

Some Case Relations seem to be well established: Agentives and Neutrals, for instance, are generally invoked, with agreement over the central instances of such; and their status as Cases is supported by many of the phenomena alluded to in 'Some Fundamentals' and 'Defining Case Relations.' And a Place or Locative Case is generally acknowledged, though its relation to Source and Goal (and Path) is contentious. It is also generally agreed that predicates of experience such as *like* involve a distinct Case, which Fillmore (1968a) dubbed Dative; but the scope of this Case is controversial, with Fillmore (1971a, 1971b), as seen above, for instance, reassigning some former Datives to Goal or Neutral and relabeling the rest Experiencer (Fillmore, 1971a: 42):

> . . . where there is a genuine psychological event or mental state verb, we have the Experiencer; where there is a non-psychological verb which indicates a change of state, such as one of dying or growing, we have the Object; where there is a transfer or movement of something to a person, the receiver as destination is taken as the Goal.

However, as we will see, there are also problems with this revised version.

Many investigators recognize an Instrumental Case Relation, as illustrated by the a hammer argument in (26):

(26a) The vandals dented the BMW with a hammer
(26b) A hammer dented the BMW

And some (cf. e.g., Fillmore, 1971a: Sect. 9) have recognized a Path:

(27) Henry traveled through Celle

Anderson (1971, 1977), however, rejects both of these as Cases, as well as most of the others that have been proposed, in favor of a very restricted set of Case Relations.

Much of this disagreement can be understood in terms of diverse interpretations of the distributional and substantive constraints that Case Relations conform to. The nature of these constraints and the differences in their application can perhaps best be appreciated in terms of an examination of a Case on whose validity most researchers seem to be agreed, the Agentive.

We can provide Agentive with a distinctive semantic definition, perhaps along the lines of one of those given above, and we can associate phrases thus defined with a distinctive distribution, particularly in relation to their role in the Subject Selection Hierarchy. Occurrence of Agentive also correlates with other semanticosyntactic properties: zero-manifestation in imperatives (*Kill Albert!* etc.), adverbial selection:

(28a) Emma killed Albert in cold blood/deliberately
(28b) *Albert died in cold blood/deliberately

where interpretation of (28b) requires some extension of our normal understanding of the meaning and the argument type normally associated with die. Agentives are also, perhaps, "typically animate" (Fillmore, 1968a), even human, as in these examples.

Some phrases that share their basic distribution with Agentives like *Emma* in (28a) are not human, or even animate, however:

(29a) Lightning killed Albert
(29b) Albert was killed by lightning

and they lack many of the associated properties. This can perhaps be allowed for in terms of Fillmore's 'typically animate'; perhaps, to elaborate on this somewhat, lightning in (29) is a nonprototypical Agentive. But what of (30) and the like?

(30a) The poison killed Albert
(30b) Albert was killed by the poison

For Fillmore (1968a), *the poison* is an Instrumental, which in the presence of an Agentive (even if not overt) is necessarily marked by *with*:

(31a) Emma killed Albert with the poison
(31b) Albert was killed with the poison (by Emma)

But the Case of *the poison* in (30a) is in fact indeterminate, given Fillmore's definitions (either A or I), or a nonexistent ambiguity is predicted for its role here.

One solution to this dilemma is to suggest that Instrumentals only ever occur with predicates that also take an Agentive (an instrument presupposes an agent) and to regard *the poison* in (30) as Agentive: it is again a nonprototypical Agentive that we interpret as normally fitting into a frame or scene that includes an (unspecified) ultimate agent. Likewise, there is no distributional reason to recognize a distinct Force Case (Huddleston, 1970) associated with *lightning* in (29): volition and the capacity to wield an instrument are not necessarily to be attributed to nonprototypical Agentives.

The fact that *the poison* in (30) and (31) is now interpreted as bearing two different Cases is analogous to the situation we associated with the Customer role above: an entity bearing the same role, say Instrument, in a 'real-world' situation may be represented linguistically in different ways (cf. [24a] and [25]), in this instance as Agentive or Instrumental. (See Anderson, 1977: Chap. 1; and for a more general description of Instrumentals, Nilsen, 1973.) If the subjects of (29a) and (30a) are not Instrumentals, then prototypical Instrumentals such as those realized in (31) do not participate in Subject and Object Selection; indeed, arguably, they are not an independent component of the subcategorization requirements of any predicate. To put it in its strongest form, it is being claimed that Instrumentals are available with any Agentive predicate. Of course, the class of Instrumental will vary with the class of Agentive predicate: one *travels by car* rather than *with (a) car* (unless one is merely accompanying it). If the availability of Instrumentals can be allowed for by redundancy, i.e., their occurrence need never be stipulated by the Case Features of any predicate, then they can be removed from the set of primary Cases. They are not Participant but Circumstantial (Halliday, 1967/1968; Anderson, 1977, 1986); not Actants (Tesnière, 1959).

The drawing of a distinction between Participant and Circumstantial is the first step in arriving at a delimitation of the set of (Participant) Case Relations. It is only to potential Participants that distributional criteria such as Fillmore's (1971a) principles of 'contrast' and 'complementarity' can be fully applied (see below); circumstantials require a rather different approach.

Circumstantials largely correspond to what many Case Grammarians have dubbed Outer Cases. (It is less clear to what extent Circumstantials as characterized here also correspond in general to Fillmore's Modal Cases.) And perhaps a less controversial

Circumstantial is what Fillmore calls the Outer Locative, as in (32):

(32a) Nigel made lots of money in London
(32b) In London Nigel made lots of money

The Outer Locative (given appropriate choice of lexical items) can appear with any predicate, and, for example, is readily fronted. Contrast the (inner) Locative in (33):

(33a) Nigel kept lots of money in a sock
(33b) ?In a sock Nigel kept lots of money

The (inner) Locative is part of the Case Frame (in its absence the lexical item *keep* has a different sense: 'retain'), and it can be accompanied by an Outer Locative:

(34a) Nigel kept lots of money in a sock in London
(34b) In London Nigel kept lots of money in a sock

Example (34b) lacks the additional interpretation available with (a) with respect to which *in London* modifies *sock*.

Anderson (1977: Chap. 1) argues that a number of proposed (Propositional) Cases are Circumstantial. Thus, Time, for instance, as in (35), is always Circumstantial:

(35) Brenda left on Tuesday

For Anderson, the temporal phrases in (36) and (37) are, respectively, Source and Goal, and Neutral:

(36) The concert lasted from seven to eleven

(37) A long period elapsed

These arguments are associated here with verbs that normally require that their Source-and-Goal or Neutral argument involve temporal reference. And Tuesday in (38) is a nonprototypical Experiencer:

(38) Tuesday saw Brenda's departure

Such a proposal is based on a strategy of eliminating, as distinctions in Case, contrasts that are basically signaled elsewhere. As such, it can be said to represent an implementation of Fillmore's (1971a: 40–41) principle of 'complementarity.'

Fillmore (1971a: Sect. 3) also offers two assumptions that he terms principles of 'contrast.' The second principle, not explicitly formulated as such, is concerned with the establishment of contrasts in Case Relation associated with a single (syntactic) position. Fillmore illustrates this with comparative constructions and with the Subjects of the same predicate in (39):

(39a) I am warm
(39b) This jacket is warm
(39c) Summer is warm
(39d) The room is warm

On one interpretation, *I* in (39a) is an Experiencer (and *warm* a psychological predicate); *this jacket* in (39b) is an Instrument; *summer* in (39c) is a Time; *the room* in (39d) is a Locative/Location. These assignments are supported by the recurrence of such distinctions in Subject position with other predicates (Fillmore discusses *sad*), but it is unclear what the syntactic consequences of some of the posited distinctions might be.

Fillmore's discussion of comparatives (only Noun Phrases of identical Case can be compared) is also inconclusive in this respect, in that it is apparent that many other semantic factors are involved in determining the wellformedness of such constructions. And implementation of 'complementarity' would suggest that (39c) and (39d) (at least) do not involve a distinction in Case (rather, of referential domain). Application of a 'contrast' principle here necessitates that the rest of the environment be kept constant, and so the possibility of 'complementarity' is eliminated.

The other principle of 'contrast' discussed by Fillmore (1971a) is the one-instance-per-clause principle: a single clause will contain at most one (possibly compound) Noun Phrase associated with a particular Case. This has been generally accepted even outside Case Grammar, as in Chomsky's Theta Criterion; and it seems to be well supported. The principal area of dissent concerns Neutral, which Anderson (1971; also 1977: Chap. 1) suggests occurs twice in equatives (*The guy over there is the man she loves*, etc.). He associates this with a further property that has been attributed to Neutral; that it is obligatory with every predicate – what Starosta (1987; also 1978) refers to as Patient Centrality.

This principle of 'contrast' has been frequently coupled with a companion principle requiring that each NP bear at most one Case Relation (Fillmore, 1968a: 24; cf. again the Theta Criterion). However, it has been argued that this is quite generally inappropriate (not just with respect to specific Cases). At issue are, among other things, sentences like those in (40):

(40a) Bert has moved the bookcase
(40b) The bookcase has moved
(40c) Bert has moved

Also see on this and other areas, such as the *see/look* Case Frames, Huddleston, 1970; Anderson, 1968: App., 1971: Chap. 1. In (40a) *Bert* and *the bookcase* are fairly uncontroversially A and N, respectively; and in (40b) *the bookcase* is once more Neutral. But what of *Bert* in (40c)? It is clearly Neutral: the referent of *Bert* undergoes the movement; and its status as

such is required by Patient Centrality. But on one interpretation at least, *Bert* is also the source of the action, Agentive. And there are semantic and syntactic consequences (adverb modification, Unergativity, etc.); some of these are also illustrated by the sentences from Eastern Pomo given in (2) above.

For a contrary view, however, see Starosta, 1987, for instance, where this distinction is not represented. Somers (1987: Chap. 8) surveys some of the arguments involved. Starosta (1988: Sect. 4.3) introduces a third 'case-like' category (besides Case Forms and Case Relations), namely Macroroles (cf. Foley and van Valin, 1984), of which there are two: Actor and Undergoer. The Actor is the Agent of a transitive clause or the Patient of an intransitive one. These are "established to account primarily for morphosyntactic rather than situational generalizations" (Starosta, 1988: 145). But one might have expected them to allow for such phenomena as others have associated with attribution of more than one Case Relation to a single argument, while maintaining the one-instance-per-NP constraint. However, "it appears that Actor, like Patient, is present in every clause" (Starosta, 1988: 146). Thus, both *the bookcase* in (40b) and *Bert* in (40c) would apparently be [+actr, +PAT]. The semantic distinction remains uncaptured. Actor also does not seem to accord well with the syntactic functions Starosta attributes to it. Thus, "the actant which may be omissible in imperatives . . . is the Actor" (Starosta, 1988: 151). But not all intransitive Patients show unmarked imperativization: this is true of (40b) as well as of the Patients associated with verbs such as *stumble*, *blister*, etc. under their normal (nonmetaphorical, non-playacting) interpretation.

Anderson (1977: Chap. 2, in particular) deploys 'complementarity' and nonunary Case assignments for NPs to argue, without recourse to Macroroles, for a very reduced set of (Participant) Cases. For instance, he suggests that Path is a combination of Source and Goal; that Goal is a variant of Locative (with a predicate that also takes a Source, a directional predicate). Experiencers are interpreted as a combination of Locative with a Case Relation which, uncombined with Locative, characterizes Agentives: a Case Relation he calls Ergative. Thus, the Case Relations in (40) are respectively represented as in (41a–c) and those in (7a) and (39a) as, respectively, (41d, 41e):

(41a) Erg Abs
(41b) Abs
(41c) Erg+Abs
(41d) Erg+Loc Abs
(41e) Erg+Loc+Abs

(where Anderson's Abs(olutive) is Neutral, the Nom of J. M. Anderson, 1971). He proposes (Anderson, 1977: 115) a set of four Cases, given in (42), with each Case characterized in terms of combinations of the notional features Place and Source, such that Abs is unmarked and Erg is a non-Place Source, source of the event or situation, physical or mental, potentially in control of it:

(42)

Case relations	Abs	Erg	Loc	Ab1
Case features			Place	Place
		Source		Source

See also, more recently, Ostler, 1980.

These characterizations incorporate a general substantive principle determining the character of Case Relations, to complement the distributional and individual properties mentioned above. They instantiate one articulation of the Localist Hypothesis (cf. Localism), whose earlier history is charted by Hjelmslev (1935/1937), in terms of which the domain of Case is structured by components utilized in our perception of spatial situations: there are no necessarily 'abstract' Case Relations. The hypothesis is one attempt to provide a general definition of Case, avoiding the problems of uncertainty and overlap associated with notional definitions particular to individual Cases.

The importance of a nonparticularist approach to Case is forcibly expressed by Hjelmslev (1935: 4):

> Délimiter exactement une catégorie est impossible sans une idée précise sur les faits de signification. Il ne suffit pas d'avoir des idées sur les significations de chacune des formes entrant dans la catégorie. Il faut pouvoir indiquer la signification de la catégorie prise dans son ensemble.

Apart from within the Localist tradition (including its partial, unwitting adoption by Gruber, 1965 and Jackendoff, 1976, 1983), it is only recently (with developments in Cognitive Grammar (*see* **Cognitive Grammar**) and elsewhere) that such a viewpoint has been to the forefront in the mainstream of the structuralist linguistic tradition in the last few decades.

The postulation of a universal theory of Case is, of course, not to say that the 'same' situation will be expressed in terms of the same Case Frame in different languages, or that what can be an Erg in language X will necessarily correspond to an Erg in language Y (cf. e.g., Dahl, 1987). The English Experiencer (Erg+Loc) in (42) is alien to a large number of languages, for instance. Rather, these Relations form the basis for constructing clause structures in any language, and their applicability is limited primarily,

within the Localist tradition, by the spatial prototypes with which they are associated.

Among the many uncertainties and contentious issues surrounding notions of Case, some of which are surveyed here, perhaps the least explored is the character and status of Circumstantials. Anderson (1986) suggests that, despite their apparent diversity, the set of Circumstantials can be described using the same set of (combinations of) Case Relations as are appropriate to distinguishing Participants, and that the hierarchy of Circumstantials in terms of their closeness of relation to the central proposition is associated with the specificity of the verb class with which they are compatible. Thus, Instrumentals, in so far as they are compatible only with Agentive verbs, are more tightly integrated than Outer Locatives or circumstantial time phrases. But here in particular, much research remains to be done (in any framework). For some discussion, see again, e.g., Somers, 1987: Chap. 1.

© 2006 Elsevier Ltd. All rights reserved.

Matthias Alexander Castrén (1813–1852) was the founder of scholarly Uralic (Finno-Ugric and Samoyed) studies and an early pioneer of linguistic field work and ethnolinguistics.

Castrén was born in Finland in southern Lapland and went to school in Oulu. He studied classical and Oriental languages at the University of Helsinki and obtained his Cand. Phil. degree in 1836. He was a good friend of the central characters of the national awakening movement in Finland, Johan Ludvig Runeberg, Elias Lönnrot, and Zacharias Topelius, and this affected his course of life. But the person who influenced him the most was A. J. Sjögren (1794–1855), an academician in the Imperial Academy in St. Petersburg. Sjögren had himself made long field trips during most of the 1820s to the western Finno-Ugric populations in Russia, and he inspired Castrén to extend the explorations eastward. Sjögren also was instrumental in arranging funding from the Academy.

Castrén had already done fieldwork in 1838–1839 in Lapland and Karelia, mainly to collect mythology and folklore. In 1841–1844 he conducted his first long field trip, to western and central Russia. Castrén studied Yurak Samoyed (Nenets) in Arkhangel'sk and then continued along the Pechora to the Komis (Zyryans). His grammar of Komi (Komi-Zyrian) (*Elementa grammatices Syrjaenae*) was published in 1844. Castrén crossed the Urals and ended up in Obdorsk, where his health started to falter and he was diagnosed with tuberculosis of the lungs. During this long trip he became convinced that Finnish and Samoyed were related. In 1845 his basic grammar of Mari, Low (Cheremis) appeared.

Castrén's decisive journey lasted from 1845 to 1849 and covered an area extending over Siberia beyond the Yenissei and Ob', from the coastal tundra of the Arctic Sea all the way to the Altay and Sayan mountains, even transgressing the Chinese border. In addition to extensive archeological and ethnographic material, he collected data on all Samoyed languages, including Kamassian (Kamas), of which he found the last 150 speakers east of Krasnoyarsk, Khanty (Ostyak), the isolated and highly complex Ket (Yenissei-Ostyak) language and the related Kott language, two dialects of Turkic, Buryat Mongolian (Buriat, Mongolia), and Evenki (Tungus). All in all, Castrén traveled more than 50 000 km.

Castrén's first comparative study (1839) treated nominal inflection in Finnish, Estonian, and Sámi. He formulated a program for further studies in the field. Castrén rejects the old speculations concerning the biblical origin of Finnish and proceeds to a concrete comparison of morphological categories. He deals with morphophonological alternations like vowel harmony and consonant gradation (*see* **Finnish**) as well as number and case inflection. He was the first to demonstrate that the stop alternations inFinnish, Estonian, and Sámi depend in part upon the structure of the following syllable (open or closed).

Castrén's most important contribution is his comparative grammar of the Samoyed languages. This 600-page posthumous work contains descriptions of all the five Samoyed languages investigated by Castrén, especially their sounds and morphological properties, and provides outlines of the development of the languages and their hypothesized common source. This work constitutes the foundation of comparative Uralic studies.

Castrén's study (1850) of pronominal suffixes in Finno-Ugric, Samoyed, Turkic, Mongolian, and Tungusic languages attempts to show that these languages are related and form the Altaic language family. However, posterity has not accepted this hypothesis.

In 1851, Castrén was appointed the first professor of Finnish at the University of Helsinki, but after only one year in office he died of complications related to his tuberculosis. Even upon his deathbed he struggled with his comparative Samoyed grammar, which (along with many of his other writings) was published posthumously by the academician Anton Schiefner in St. Petersburg (Castrén, 1853–1862).

Geography and Demography

The territories where Catalan is natively spoken cover 68 730 km^2, of which 93% lies within Spain (see Figure 1). They are:

1. The Principality of Andorra
2. In France: North Catalonia – almost all of the département of Pyrénées-Orientales
3. In Spain: Catalonia, except for the Gascon-speaking Vall d'Aran; the eastern fringe of Aragon; most of Valencia (the Comunitat Valenciana), excepting some regions in the west and south that have been Aragonese/Spanish-speaking since at least the 18th century; El Carxe, a small area of the province of Murcia, settled in the 19th century; and the Balearic Islands
4. In Italy: the port of Alghero (Catalan *L'Alguer*) in Sardinia

Table 1 shows the population of these territories (those over 2 years of age in Spain) and the percentages of the inhabitants who can understand, speak, and write Catalan. Information is derived from the 2001 census in Spain together with surveys and other estimates; the latter are the only sources of language data in France and Italy. The total number of speakers of Catalan is a little under 7.5 million. Partly as a result of the incorporation of Catalan locally into the education system, there are within Spain a significant number of second-language speakers who are included in this total. Virtually all speakers of Catalan are bilingual, using also the major language of the state they live in. (Andorrans are bilingual in Spanish or French, or are trilingual.)

Genetic Relationship and Typological Features

Catalan is a member of the Romance family and a fairly prototypical one, as befits its geographically central position in the European Romance area. Some particularly noteworthy characteristics are pointed out here (for more details see Wheeler, 1988). In historical phonology, note the palatalization of initial /l-/ and loss of stem-final /n/ that became word final, for example, LEONEM > *lleó* [ʎə'o] 'lion.' Original intervocalic -C′-, -TJ-, -D- became /w/ in word-final position and were lost elsewhere, for examples, PLACET > *plau* ['plaw] 'please.3.SING,' PLACEMUS > *plaem* [plə'ɛm] 'please. 1.PL.' As the previous examples also illustrate, posttonic nonlow vowels were lost, so that a dominant pattern of phonological words is of consonant-final oxytones. The full range of common Romance verbal inflection is retained, including inflected future (*sentirà* 'hear.3.SING.FUT'), widely used subjunctives, and a contrast between present perfect (*ha sentit* 'has heard') and past perfective (*sentí* 'heard.3.SING. PERF'). In addition to the inherited past perfective form, now largely literary, Catalan developed a periphrastic past perfective using an auxiliary that was originally the present of 'go' (*va sentir* 'AUX. PERF.3.SING hear.INF'). In some varieties of Catalan, this construction has developed a subjunctive (*vagi sentir* 'AUX.PERF.SUBJ.3.SING hear.INF'), introducing, uniquely in Romance, a perfective/imperfective aspect distinction in the subjunctive. Considerable use is made of pronominal and adverbial clitics that attach to verb forms in direct and indirect object functions or partitive or adverbial functions, quite often in clusters of two or three, as in (1).

(1) us n'hi envi-en
2.PL.OBJ PART.LOC *send*-3.PL
"they send some to you (PL) there"

Most of the pronominal/adverbial clitics have several contextually conditioned forms; thus, the partitive clitic shows variants *en* ∼ *n'* ∼ *-ne*. Clitic climbing is commonly found with a pronominal complement of a verb that is itself the complement of a (semantic) modal, as in (2). This example also shows the (optional) gender agreement of a perfect participle with a preceding direct object clitic.

(2) no l'he sab-ud-a agafa-r
not DO.3.SING.F. *know-* *catch*-INF
have.1.SING PART-F
"I haven't been able to catch it (FEM)"

Figure 1 Catalan-speaking areas and dialects.

A fair number of items in the basic vocabulary are etymologically distinct from the corresponding terms in neighboring Romance languages, for example, *estimar* 'to love,' *ganivet* 'knife,' *gens* 'not at all,' *massa* 'too,' *pujar* 'to go up,' *tardor* 'autumn,' and *tou* 'soft.'

Dialects

Although there are significant dialect differences in Catalan, the dialects are to a high degree mutually intelligible. They are conventionally divided into two groups, on the basis of differences in phonology as

Table 1 Catalan language demography and competences

Territory	*Population*	*Understand Catalan (%)*	*Speak Catalan (%)*	*Write Catalan (%)*
Andorra	66 000	97	91	(No data)
North Catalonia	363 000	59	41	10
Catalonia	6 215 000	95	75	50
Aragon fringe	50 000	95	90	(No data)
Valencia	4 145 000	85	48	23
Balearics	822 000	90	68	26
Alghero/*L'Alguer*	38 000	53	46	(No data)
Total	11 699 000	89	64	37

well as some significant features of verb morphology; there are some interesting lexical differences, too. The eastern dialect group (see **Figure 1**) includes North Catalan or *rossellonès* (in France), central Catalan (in the eastern part of Catalonia), Balearic, and *alguerès* (in Alghero/L'Alguer). The western group consists of Northwestern Catalan (western and southern Catalonia and eastern Aragon) and Valencian. The main diagnostic heterogloss distinguishing the two major dialect groups involves vowel reduction in unstressed syllables: In the eastern dialects /a/ is pronounced [ə] in unstressed syllables and, with some exceptions, /e/ and /ɛ/ are also reduced to [ə], whereas /o/ and /ɔ/ are reduced to [u].

History

Catalan is a variety of Latin that developed originally on a small territory on either side of the eastern Pyrenees. Expansion of this territory, the Marca Hispanica of the Carolingian empire, is associated with a process of developing political independence, beginning with the separation (A.D. 988) of the county of Barcelona from the trunk of the Carolingian domain. Eventual fusion with the crown of Aragon (1162) gave new momentum to this projection. In 1151, a treaty between the kings of Aragon and Castile had carved up the future conquest of territories then under Arab control, so that Valencia would fall to the crown of Aragon while lands further west would be attached to Castile. The kingdom of Valencia was captured in the 1230s and was populated by speakers from various parts of Catalonia and Aragon, although a numerous subordinate population of Arabic-speaking *moriscos*, as they were called, remained until their expulsion in 1609. The Balearic Islands were conquered between 1229 and 1287 and were resettled by speakers largely from eastern Catalonia. Sicily was also captured for the house of Barcelona (1282), as was Sardinia (1323–1327); Catalan was widely used as an official language in Sicily until the 15th century and in Sardinia until the 17th century. In Sardinia, only the port of Alghero was subject to Catalan resettlement, and it has remained Catalan-speaking to the present day. The original expansion southward of Catalan following the reconquest extended as far as Murcia and Cartagena, although the kingdom of Murcia became Spanish-speaking during the 15th century.

The chancellery of the kingdom of Aragon was trilingual, using Latin, Catalan, and Aragonese as the occasion required. A substantial body of Catalan literature in various prose and verse genres was produced before decline set in in the 16th century. In 15th-century Valencia the court was already bilingual, and after the merger of the Aragonese and Castilian crowns in 1479 Spanish (Castilian) gradually increased in prestige throughout the Catalan territories, with the urban and literate classes becoming bilingual. From the 16th century, Catalan came increasingly under Spanish influence in vocabulary, syntax, pronunciation, and orthography as a result of the social and cultural prestige of Castile. It was not until the 19th century that a substantial Catalan literary and cultural revival took place, which continues to the present. Standardization of the modern language was achieved in the early 20th century.

Since the Second World War, most of the Catalan-speaking territories have experienced a substantial immigration of non-Catalan speakers. In France, these have been *pieds noirs* resettled from Algeria and retired people from various parts of France. In Catalonia and Valencia, the population almost doubled between 1950 and 1975 as people from less-developed southern Spain sought employment in the manufacturing and service industries. Majorca and Ibiza (Eivissa) have attracted a workforce from many parts of Spain, feeding the tourist industry. Many immigrants have wished to acquire Catalan, or at least have wished their children to do so, as an aid to integration, but until the late 1970s there were few opportunities to realize this. These large Spanish-speaking communities have added to the institutional

and cultural pressures in favor of the use of Spanish in the Catalan territories.

In 1659, Philip IV of Spain ceded the northern part of Catalonia (essentially the modern département of Pyrénées-Orientales) to the French crown. From that point, North Catalonia became subject to the linguistic unification policies of the French state. French became the official language in 1700 and has had a marked influence on the vocabulary of North Catalan and, in recent times, on its phonology as well. Minorca was under British rule during most of the 18th century, and there is a handful of Minorcan Anglicisms in the vocabulary dating from that period. The dialect of Alghero is, not surprisingly, heavily influenced by Sardinian and even more so by Italian in all components of the language.

Present Sociolinguistic Situation

The status, situation, and prospects of the Catalan language are significantly different in each of the territories in which it is spoken, although each of those in Spain shares, in some way, the consequences of Catalan's having been for centuries an oppressed minority language. The cultural decline and loss of prestige affecting Catalan from the 16th century onward has already been mentioned. The defeat of the Catalans in the war of the Spanish Succession (1714) initiated a series of measures, extending throughout the 18th and 19th centuries, that imposed the use of Spanish in public life, for example, in accounts, in preaching, in the theater, in the criminal courts, in education, in legal documents, in the civil registers, and on the telephone. In the 20th century, these measures were mostly repeated and supplemented by the imposition of Spanish in catechism, by the prohibition of the teaching of Catalan, and by sanctions against people refusing to use Spanish. The Second Republic (1931–1939) to a large extent removed these restrictions, but Franco's victory in the Spanish Civil War was followed in 1940 by a total ban on the public use of Catalan. Despite a gradual relaxation allowing some publication of books and magazines, Catalan remained excluded from nearly all public institutions until Spain's adoption of a democratic constitution in 1978.

In the early 1980s, Catalonia, Valencia, and the Balearics obtained their statutes of autonomy, involving co-official status for Spanish and Catalan. All of these statutes promote language normalization, the goal of which is universal bilingualism without diglossia. In Catalonia, the expressed aim of the Generalitat (the autonomous government) goes further than this: It seeks to make the local language the normal medium of public life, with Spanish having a secondary role as an auxiliary language or a home language for its native speakers. In Catalonia, the teaching of Catalan is obligatory in all schools, and primary and secondary education through the medium of Catalan now reaches at least 60% of the population. In Valencia and the Balearics, the de facto policy has been to promote effective knowledge of Catalan through education and to enhance its status while largely preserving a diglossic relationship between Spanish and Catalan. In Valencia, significant political forces reject the name Catalan for the local language and insist on the term Valencian. Although the Balearic Islands Council passed a linguistic normalization law in 1986, progress has been inconsistent, although Catalan is widely available in the education system which includes some Catalan-medium education.

In Andorra, Catalan has always been the sole official language. In 1993, Andorra adopted a new constitution, and the government has been pursuing an active Andorranization policy, involving Catalan-medium education. The status of Catalan in North Catalonia is parallel to that of the other traditional minority languages in France. Language shift was all but universal after the Second World War, so that most native speakers are (as of 2004) over 60 years old. Catalan has at best an occasional, decorative role in public life. In primary schools, some 30% study Catalan (as a foreign language) and, in secondary schools, some 15%.

The current trend is for intergenerational language shift from Catalan in French Catalonia, in Alghero, in southern Valencia around Alicante (Alacant), and possibly in Palma (Majorca). Elsewhere, Catalan is holding its own, with some evidence of intergenerational shift toward Catalan in Catalonia.

Categorial Grammars: Deductive Approaches

G Morrill, Polytechnic University of Catalonia, Barcelona, Spain

© 2006 Elsevier Ltd. All rights reserved.

Introduction

According to Frege, it is certain possibly complex expressions, and not in general the words, which are the primary bearers of meaning. Thus, while phrase structure grammar classifies words and phrases by atomic categories or types, what Bar-Hillel (1964) dubbed 'categorial grammar' is characterized by the classification of words and phrases into atomic and complex fractional types according to their completeness or incompleteness as expressions (Husserl, 1913; Ajdukiewicz, 1935; Bar-Hillel, 1953). Lambek (1958) gave a calculus in this spirit for which was provided a Gentzen-style sequent system. Deductive approaches to categorial grammar were thus born.

In the next section we present an introduction to categorial grammar. In the section 'Deductive Systems' we review categorical calculus, sequent calculus, natural deduction, and proof nets. The technical appendix provides a contemporary definition of categorial formalism.

Categorial Grammar

In Categorial Grammar (*see also* **Combinatory Categorial Grammar**) the categories or types by which linguistic expressions are classified are defined recursively on the basis of a small set of atomic types by means of two operators, / (over) and \ (under). Atomic types (for example, S for declarative sentence, N for referring nominal and CN for count noun) are types, and if A and B are types, so are the functor types B/A and $A\backslash B$. Expressions of type B/A are those which concatenate with argument As on the right to form Bs and expressions of type $A\backslash B$ are those which concatenate with argument As on the left to form Bs. (Some authors write $B\backslash A$ for $A\backslash B$; we keep to the original notation by which cancellation is under adjacency.) Thus, for example, whereas phrase structure grammar might have a rule N → DefArt CN showing that a definite article combines with a count noun to form a referring nominal, categorial grammar may express the same information by assigning a definite article the functor type N/CN, showing that it combines with a count noun on the right to form a referring nominal.

Let us write α: A to indicate that the expression α is of type A. Then a categorial lexicon might include the following type assignments:

(1) **cat**: CN
Mary: N
likes: (N\S)/N
sleeps: N\S
that: (CN\CN)/(S/N)
the: N/CN

What type assignments follow from what? It is easy to see that the following are valid, where concatenation is indicated by +:

(2)
$$\frac{\beta: B/A \qquad \alpha: A}{\beta+\alpha: B}\,E/ \qquad\qquad \frac{\alpha: A \qquad \beta: A\backslash B}{\alpha+\beta: B}\,E\backslash$$

Furthermore, where a is a variable and coindexed overline indicates the withdrawal of a type assignment statement, the following are valid:

(3)
$$\begin{array}{l} \text{------}i \\ a: A \\ \vdots \\ \beta+a: B \\ \text{------}I/^{i} \\ \beta: B/A \end{array} \qquad\qquad \begin{array}{l} \text{------}i \\ a: A \\ \vdots \\ a+\beta: B \\ \text{------}I\backslash^{i} \\ \beta: A\backslash B \end{array}$$

In the rules E stands for elimination, because the operator is eliminated reading from premises to conclusion, and I stands for introduction, because the operator is introduced reading from premises to conclusion. There are the following derivations of the sentence 'the cat sleeps' and the relative clause 'that Mary likes.'

(4)
$$\frac{\dfrac{\textbf{the}: N/CN \qquad \textbf{cat}: CN}{\textbf{the+cat}: N}\,E/ \qquad \textbf{sleeps}: N\backslash S}{\textbf{the+cat+sleeps}: S}\,E\backslash$$

Categorial Grammars: Deductive Approaches

G Morrill, Polytechnic University of Catalonia, Barcelona, Spain

© 2006 Elsevier Ltd. All rights reserved.

Introduction

According to Frege, it is certain possibly complex expressions, and not in general the words, which are the primary bearers of meaning. Thus, while phrase structure grammar classifies words and phrases by atomic categories or types, what Bar-Hillel (1964) dubbed 'categorial grammar' is characterized by the classification of words and phrases into atomic and complex fractional types according to their completeness or incompleteness as expressions (Husserl, 1913; Ajdukiewicz, 1935; Bar-Hillel, 1953). Lambek (1958) gave a calculus in this spirit for which was provided a Gentzen-style sequent system. Deductive approaches to categorial grammar were thus born.

In the next section we present an introduction to categorial grammar. In the section 'Deductive Systems' we review categorical calculus, sequent calculus, natural deduction, and proof nets. The technical appendix provides a contemporary definition of categorial formalism.

Categorial Grammar

In Categorial Grammar (*see also* **Combinatory Categorial Grammar**) the categories or types by which linguistic expressions are classified are defined recursively on the basis of a small set of atomic types by means of two operators, / (over) and \ (under). Atomic types (for example, S for declarative sentence, N for referring nominal and CN for count noun) are types, and if A and B are types, so are the functor types B/A and $A\backslash B$. Expressions of type B/A are those which concatenate with argument As on the right to form Bs and expressions of type $A\backslash B$ are those which concatenate with argument As on the left to form Bs. (Some authors write $B\backslash A$ for $A\backslash B$; we keep to the original notation by which cancellation is under adjacency.) Thus, for example, whereas phrase structure grammar might have a rule N → DefArt CN showing that a definite article combines with a count noun to form a referring nominal, categorial grammar may express the same information by assigning a definite article the functor type N/CN, showing that it combines with a count noun on the right to form a referring nominal.

Let us write α: A to indicate that the expression α is of type A. Then a categorial lexicon might include the following type assignments:

(1) **cat**: CN
Mary: N
likes: (N\S)/N
sleeps: N\S
that: (CN\CN)/(S/N)
the: N/CN

What type assignments follow from what? It is easy to see that the following are valid, where concatenation is indicated by +:

(2)
$$\frac{\beta: B/A \qquad \alpha: A}{\beta+\alpha: B}\,E/ \qquad\qquad \frac{\alpha: A \qquad \beta: A\backslash B}{\alpha+\beta: B}\,E\backslash$$

Furthermore, where a is a variable and coindexed overline indicates the withdrawal of a type assignment statement, the following are valid:

(3)
$$\begin{array}{l} \overline{}\,i \\ a: A \\ \vdots \\ \beta+a: B \\ \overline{}\,I/^{i} \\ \beta: B/A \end{array} \qquad\qquad \begin{array}{l} \overline{}\,i \\ a: A \\ \vdots \\ a+\beta: B \\ \overline{}\,I\backslash^{i} \\ \beta: A\backslash B \end{array}$$

In the rules E stands for elimination, because the operator is eliminated reading from premises to conclusion, and I stands for introduction, because the operator is introduced reading from premises to conclusion. There are the following derivations of the sentence 'the cat sleeps' and the relative clause 'that Mary likes.'

(4)
$$\frac{\dfrac{\textbf{the}: N/CN \qquad \textbf{cat}: CN}{\textbf{the+cat}: N}\,E/ \qquad \textbf{sleeps}: N\backslash S}{\textbf{the+cat+sleeps}: S}\,E\backslash$$

(5)

```
                                                  ------i
                                likes: (N\S)/N     a: A
                                ----------------------------E/
                  Mary: N            likes+a: N\S
                  ----------------------------------------E\
                          Mary+likes+a: S
                          ------------------I/i
that: (CN\CN)/(S/N)       Mary+likes: S/N
-------------------------------------------------E/
        that+Mary+likes: CN\CN
```

These will be our running examples in the presentation of deductive systems in the next section.

By way of motivation of categorial grammar, consider right node raising and left node raising coordination:

(6a) John likes and Mary dislikes London.
(6b) John showed Mary Paris and Suzy Berlin.

The conjuncts are nonconstituents on a phrase structure view of grammar; however, in categorial grammar the conjuncts can be analyzed as units so that the node raising can be treated as coordination of like-type constituents:

(7a)

```
                                          ------i
                          likes: (N\S)/N   a: N
                          ------------------------------E/
John: N                       likes+a: N\S
-------------------------------------------------E\
              John+likes+a: S
              ------------------I/i
              John+likes: S/N
```

(7b)

```
------------------i
a: ((N\S)/N)/N          Mary: N
--------------------------------------E/
        a+Mary: (N\S)/N            Paris: N
        ---------------------------------------------E/
                a+Mary+Paris: N\S
        ---------------------------------------------I/i
        Mary+Paris: (((N\S)/N)/N)\(N\S)
```

Deductive Systems

In addition to the *division* operators \ and / there is a *product* operator • such that $A \bullet B$ signifies the concatenation of an A and a B. The interpretation of the categorical operators is summarized:

(8) $[[A \bullet B]] = \{s_1 + s_2 |\ s_1 \in [[A]] \text{ and } s_2 \in [[B]]\}$
$[[A \backslash C]] = \{s |\ \text{for all } s' \in [[A]],\ s' + s \in [[C]]\}$
$[[C/B]] = \{s |\ \text{for all } s' \in [[B]],\ s + s' \in [[C]]\}$

The purpose of deductive systems is to provide sound and complete calculi for this interpretation (Buszkowski, 1986; Pentus, 1994). We consider in turn categorial calculus, sequent calculus, natural deduction, and proof nets.

Categorical Calculus

An arrow $A \rightarrow B$ comprises a source syntactic type A and a target syntactic type B. An arrow is *valid* if and only if in every interpretation, $[[A]]$ is a subset of $[[B]]$. There is the following calculus of valid arrows (Lambek, 1958):

(9)

a. id: $A \rightarrow A$

b. $\dfrac{A \rightarrow B \quad B \rightarrow C}{A \rightarrow C}$ Trans

c. α: $(A \bullet B) \bullet C \rightarrow A \bullet (B \bullet C)$

d. α^{-1}: $A \bullet (B \bullet C) \rightarrow (A \bullet B) \bullet C$

e. $\dfrac{A \bullet B \rightarrow C}{A \rightarrow C/B}\ \beta$

f. $\dfrac{A \bullet B \rightarrow C}{B \rightarrow A \backslash C}\ \gamma$

g. $\dfrac{A \rightarrow C/B}{A \bullet B \rightarrow C}\ \beta^{-1}$

h. $\dfrac{B \rightarrow A \backslash C}{A \bullet B \rightarrow C}\ \gamma^{-1}$

For example, the following shows that the types for 'the cat sleeps' in order yield a sentence:

(10)

```
                                  -------------id
                                  N\S →  N\S
                                  -------------γ⁻¹
----------------------id          N•(N\S) → S
N/CN → N/CN                       ---------------β
----------------------β⁻¹         N → S/(N\S)
(N/CN)•CN → N
-------------------------------------------------------Trans
          (N/CN)•CN → S/(N\S)
          -------------------------------β⁻¹
          ((N/CN)•CN)•(N\S) → S
```

Where R abbreviates CN\CN and TV abbreviates (N\S)/N, the following shows that 'that Mary likes' yields an R:

(11)

```
                                  -------------id
                                  TV → TV
                                  ---------------β⁻¹
                                  TV•N → N\S
-----------------------------α    -------------γ⁻¹          -----------------------------id
(N•TV)•N → N•(TV•N)               N•(TV•N) → S               R/(S/N) → R/(S/N)
-------------------------------------------------------------Trans
                                  (N•TV)•N → S               -----------------------------β⁻¹
                                  --------------------β      R/(S/N))•(S/N) → R
                                  N•TV → S/N                 -----------------------------γ
                                  -------------------------------------------------------Trans
                                          N•TV → (R/(S/N))\R
                                          ---------------------------γ⁻¹
                                          (R/(S/N))•(N•TV) → R
```

The rules of the categorical calculus are elegant but, as we see, the proofs are not very economical. Furthermore, given an arrow to be proved there is no obvious strategy to search for a proof because in the rule Trans of (9b) the type B is an unknown reading from conclusion to premises. This situation is improved in the sequent calculus.

Sequent Calculus

A *sequent* $\Gamma \Rightarrow A$ comprises a nonempty sequence of *antecedent* types Γ and a *succedent* type A. A sequent

$A_0, \ldots, A_n \Rightarrow A$ is *valid* if and only if in every interpretation, if $s_0 \in [[A_0]], \ldots, s_n \in [[A_n]]$ then $s_0 + \ldots + s_n \in [[A]]$. There is the following calculus of valid sequents (Lambek, 1958):

(12) a. $A \Rightarrow A$ b. $\dfrac{\Gamma \Rightarrow A \quad \Delta_1, A, \Delta_2 \Rightarrow C}{\Delta_1, \Gamma, \Delta_2 \Rightarrow C}$ Cut

(13) a. $\dfrac{\Gamma_1 \Rightarrow A \quad \Gamma_2 \Rightarrow B}{\Gamma_1, \Gamma_2 \Rightarrow A \bullet B}$ •R b. $\dfrac{\Delta_1, A, B, \Delta_2 \Rightarrow C}{\Delta_1, A \bullet B, \Delta_2 \Rightarrow C}$ •L

(14) a. $\dfrac{\Gamma, A \Rightarrow C}{\Gamma \Rightarrow C/A}$ /R b. $\dfrac{\Gamma \Rightarrow A \quad \Delta_1, C, \Delta_2 \Rightarrow D}{\Delta_1, C/A, \Gamma, \Delta_2 \Rightarrow D}$ /L

c. $\dfrac{A, \Gamma \Rightarrow C}{\Gamma \Rightarrow A/C}$ \R b. $\dfrac{\Gamma \Rightarrow A \quad \Delta_1, C, \Delta_2 \Rightarrow D}{\Delta_1, \Gamma, A\backslash C, \Delta_2 \Rightarrow D}$ \L

These divide into the identity rules (12) and the logical rules (13) and (14). For each operator there is a left (L) logical rule in which the operator appears in the antecedent of the conclusion and a right (R) logical rule in which the operator appears in the succedent of the conclusion.

With the exception of Cut, which introduces the unknown type A reading from conclusion to premises, every rule contains one less operator in the premises than in the conclusion. Now the calculus enjoys Cut elimination, that is to say that every provable sequent can be proved without the use of Cut (Lambek, 1958). Hence, the calculus provides a decision procedure, backward-chaining from the sequent to be proved in the finite Cut-free search space. For example:

(15)
$$\dfrac{CN \Rightarrow CN \qquad \dfrac{N \Rightarrow N \qquad S \Rightarrow S}{N, N\backslash S \Rightarrow S}\backslash L}{N/CN, CN, N\backslash S \Rightarrow S}\,/L$$

(16)
$$\dfrac{N \Rightarrow N \qquad \dfrac{\dfrac{\dfrac{N \Rightarrow N \qquad S \Rightarrow S}{N, N\backslash S \Rightarrow S}\backslash L}{N, (N\backslash S)/N, N \Rightarrow S}\,/L}{N, (N\backslash S)/N \Rightarrow S/N}\,/R \qquad R \Rightarrow R}{R/(S/N), N, (N\backslash S)/N, N \Rightarrow R}\,/L$$

However, the Cut-free search space still contains proofs which differ in inessential orderings of rules. For example, the following is equivalent to (15):

(17)
$$\dfrac{\dfrac{CN \Rightarrow CN \qquad N \Rightarrow N}{N/CN, CN \Rightarrow N}\,/L \qquad S \Rightarrow S}{N/CN, CN, N\backslash S \Rightarrow S}\,\backslash L$$

Natural Deduction

In natural deduction (Barry *et al.*, 1991), proofs are ordered trees with hypothesis types at leaves and a conclusion type at the root, with coindexation indicating the closing of hypotheses under hypothetical reasoning. Proofs are combined and extended at the roots starting from single types. A proof with left-to-right unclosed leaves $A_0, \ldots, A_n$ asserts that in every interpretation, if $s_0 \in [[A_0]], \ldots, s_n \in [[A_n]]$ then $s_0 + \ldots + s_n$ belongs to the root type.

(18) (a)
$$\dfrac{A \qquad A\backslash C}{C}\,\backslash E$$
(b)
$$\dfrac{C/B \qquad B}{C}\,/E$$
(c)
$$\dfrac{\begin{array}{c} -i \\ A \\ \vdots \\ C \end{array}}{A\backslash C}\,\backslash I^i$$
(d)
$$\dfrac{\begin{array}{c} -i \\ B \\ \vdots \\ C \end{array}}{C/B}\,/I^i$$

(19) (a)
$$\dfrac{A \qquad B}{A \bullet B}\,\bullet I$$
(b)
$$\dfrac{A \bullet B \qquad \begin{array}{c} -i \\ A \\ \vdots \\ -i \\ B \\ \vdots \\ D \end{array}}{D}\,\bullet E^i$$

As with the calculus of the 'Categorial Grammar' section, which is a labeled form of natural deduction, for each operator there is a rule of elimination (E) such that the operator is eliminated reading from premise to conclusion and a rule of introduction (I) such that the operator is introduced reading from premise to conclusion. In \I, A must be the leftmost hitherto unclosed hypothesis and cannot be the last such; in /I, B must be the rightmost hitherto unclosed hypothesis and cannot be the last such. In •E, A and B must be the only unclosed hypotheses in the indicated subderivation.

For example:

(20)
$$\dfrac{\dfrac{N/CN \qquad CN}{N}\,/E \qquad N\backslash S}{S}\,\backslash E$$

(21)
$$\dfrac{R/(S/N) \qquad \dfrac{\dfrac{(N\backslash S)/N \qquad \begin{array}{c} -i \\ N \end{array}}{N}\,/E \qquad N\backslash S}{S}\,\backslash E}{S/N}\,/I^i$$
$$R \quad /E$$

Natural deduction provides quite an economic proof syntax because it does not iterate the contexts of sequent calculus inferences. However, it does not provide an obvious proof search procedure because on the one hand, working from leaves to root, it is not clear which hypotheses to make and later close, and on the other hand, working from root to leaves, /E and \E introduce an unknown. In the next section we present proof nets, which combine the representational and computational advantages of sequent calculus and natural deduction.

Proof Nets

When we inspect the sequent calculus we see that it is predictable which sequent rule will apply to an operator in a proof of a sequent. To the main operator * in an antecedent type will apply the rule *L, to the main operator * in a succedent type will apply the rule *R, and to a subordinate operator * will apply *L or *R according to the propagation of subtypes in the unfolding of a proof. This means we can anticipate the antecedent or succedent position of a type in a proof.

Let there be two *polarities*: input ($^\bullet$) and output ($^\circ$), corresponding respectively to antecedent (L) and succedent (R) position. A *polar type* A^p is a type together with a polarity p. A *polar type tree* is the result of unfolding a polar type up to its atomic leaves according to the following *logical links*:

(22) (a) $A^\circ \quad C^\bullet$ ----------ii, $A\backslash C^\bullet$ (b) $C^\circ \quad A^\bullet$ ----------i, $A\backslash C^\circ$

(c) $C^\bullet \quad B^\circ$ ----------ii, $C/B^\bullet$ (d) $B^\bullet \quad C^\circ$ ----------i, C/B°

(23) (a) $A^\bullet \quad B^\bullet$ ----------i, $A\bullet B^\bullet$ (b) $B^\circ \quad A^\circ$ ----------ii, $A\bullet B^\circ$

In each link, the premises above the line are the immediate subtypes of the conclusion below the line, marked with polarity according to the propagation to antecedent or succedent position. The links (22a–d) and (23a, b) correspond respectively to \L, \R, /L, /R, •L, and •R, showing just the active types without the iterated contexts. They are marked i or ii according as the rule is unary (the premises belong to the same subproof) or binary (the premises belong to different subproofs). Note that in the output unfoldings the left-to-right order of the subtypes is switched. The intuition behind this is that output polarity hides an implicit negation, and in a noncommutative system the negation/reverse of A first and then B second is the negation/reverse of B first and the negation/reverse of A second.

A *proof frame* is a list of polar type trees comprising an output type followed by at least one input type. A proof structure is the result of connecting in a proof frame every leaf with one other with the same atomic type and complementary polarity. These connections are called *axiom links*. A proof structure is a *proof net* if and only if:

(24a) (Acyclicity) Every cycle crosses both edges of some i-link.

(24b) (Planarity) The axiom linking is planar in the ordering of the leaves induced by the list ordering of the frame, i.e., the axiom linking can be drawn in the half-plane without crossing lines.

(24c) (No subtending) No axiom link connects the left and right descendent leaves of an output division node.

(For acyclicity see Danos and Regnier, 1989; for planarity see Roorda, 1991; for no subtending see de Groote and Retoré, 2003.) A proof net over a proof frame A°, $A_0^\bullet$, …, $A_n^\bullet$ asserts that in every interpretation, if $s_0 \in [[A_0]], \ldots, s_n \in [[A_n]]$ then $s_0 + \ldots + s_n \in [[A]]$. For example:

(25)

(26)

Notice that, the cycle in (26) does indeed cross both edges of a i-link so that it complies with acyclicity.

Introducing now the semantic dimension, a proof net analysis contains implicitly the semantic reading of a proof (de Groote and Retoré, 1996). The semantic form is recovered following a deterministic *semantic trip* through the net. The semantic trip starts upwards at the unique output root and proceeds according to the instructions in (27)–(28), generating the successive characters of the semantic form as indicated. The trip bounces at input roots inserting

the associated lexical semantics. It ends downwards back at the origin having crossed each edge twice, once in each direction.

(27) (a) (b)

(c) (d)

(28) (a) (b)

For example, the result of performing the semantic trip on (25) is (29) and the result of performing the semantic trip on (26) is (30a), which is equivalent to (30b).

(29) (*sleep* (ι *cat*))

(30a) ($\lambda x \lambda y \lambda z$((& ($y$ z)) (x z)) λx((*like* x) m))
(30b) $\lambda y \lambda z$((& (y z)) ((*like* z) m))

Conclusion

We have illustrated deductive approaches to the Lambek calculus, the nucleus of categorial grammar. We have seen a variety of calculi leading up to proof nets, which for their parsimony and economy can claim to be **the** syntactic structures of deductive categorial grammar. Recent work has concentrated on generalizations of the basic calculus, extending its linguistic coverage while trying to preserve its attractive logical properties (Morrill, 1994; Carpenter, 1997; Moortgat, 1997). Perhaps the most challenging contemporary aspect is the development of corresponding theories of proof nets (see e.g., Moot and Puite, 2002; Fadda, 2004; Fadda and Morrill, 2005).

Technical Appendix

We are interested in modeling the two dimensions of language: form and meaning. Categorial grammar classifies expressions simultaneously with respect to these two dimensions. We refer to the first as *prosodics*, signifying word order abstracted from mode of articulation, e.g., verbalization or signing, but potentially including intonational contours or their analogue. We refer to the second as *semantics*, signifying logical semantics abstracted from illocution, but potentially including focus or other discourse semantic notions. Syntax is seen as the bridge between these two dimensions.

In the first section we present prosodic representation and interpretation and in the second section semantic representation and interpretation. In the third section we present categorial syntactic types and their bidimensional interpretation.

Prosodics

A *prosodic structure* is a semigroup, i.e., an algebra $(L, +)$ of arity (2) such that $+$ is associative:

(31) $s_1+(s_2+s_3)=(s_1+s_2)+s_3$

Let there be a set **B** of prosodic constants. Then the set **C** of *prosodic forms* is defined by:

(32) $\mathbf{C} ::= \mathbf{B} \mid \mathbf{C}+\mathbf{C}$

That is, the prosodic forms are the terms of a prosodic algebra. A *prosodic interpretation* comprises a prosodic structure $(L, +)$ and a prosodic valuation mapping from **B** into L. The prosodic value $[\alpha]_w \in L$ of a prosodic form α with respect to a prosodic interpretation with *prosodic valuation* w is defined by:

(33) $[\mathbf{a}]_w = w(\mathbf{a})$ for $\mathbf{a} \in \mathbf{B}$
$[\alpha+\beta]_w = [\alpha]_w + [\beta]_w$

Two prosodic forms α and β are *equivalent*, $\alpha \cong \beta$, if and only if $[\alpha]_w = [\beta]_w$ in every prosodic interpretation. Since prosodic structures are associative we have:

(34) $\alpha+(\beta+\gamma) \cong (\alpha+\beta)+\gamma$

Hence, we may omit parentheses in prosodic forms.

Semantics

The functional exponentiation of a set X to a set Y, $X \uparrow Y$ is the set of all functions mapping from Y into X. The cartesian product of a set X with a set Y, $X \times Y$, is the set of all ordered pairs with first element in X and second element in Y. The set **T** of semantic types is defined by:

(35) $\mathbf{T} ::= \mathrm{e} \mid \mathrm{t} \mid \mathbf{T} \rightarrow \mathbf{T} \mid \mathbf{T} \,\&\, \mathbf{T}$

A semantic structure is a **T**-indexed family of sets $\{D_\tau\}_{\tau_e \mathbf{T}}$ such that D_e is a nonempty set of entities, D_t is the set $\{\emptyset, \{\emptyset\}\}$ of truth values, and

(36) $D_{\tau 1 \rightarrow \tau 2} = D_{\tau 2} \uparrow D_{\tau 1}$
$D_{\tau 1 \& \tau 2} = D_{\tau 1} \times D_{\tau 2}$

Let there be a set $\mathbf{V}_\tau$ of semantic variables for each semantic type τ and a set $\mathbf{C}_\tau$ of semantic constants for each semantic type τ, including the logical semantic constants:

(37) $\vee, \&, \rightarrow \in \mathbf{C}_{t\rightarrow(t\rightarrow t)}$
$-\in \mathbf{C}_{t\rightarrow t}$
$\forall, \exists \in \mathbf{C}_{(e\rightarrow t)\rightarrow t}$
$\iota \in \mathbf{C}_{(e\rightarrow t)\rightarrow e}$

The sets Φ_τ of semantic terms for each semantic type τ are defined by:

(38) $\Phi_\tau ::= \mathbf{V}_\tau \mid \mathbf{C}_\tau \mid (\Phi_{\tau'\rightarrow\tau}\Phi_{\tau'}) \mid \pi_1\Phi_{\tau\&\tau'} \mid \pi_2\Phi_{\tau'\&\tau}$
$\Phi_{\tau'\rightarrow\tau} ::= \lambda \mathbf{V}_{\tau'}\Phi_\tau$
$\Phi_{\tau\&\tau'} ::= (\Phi_\tau, \Phi_{\tau'})$

An occurrence of a semantic variable x in a semantic term is *bound* if and only if it falls within a subterm of the form $\lambda x\phi$; otherwise it is *free*. The result $\phi\{\psi/x\}$ of substituting semantic variable x (of semantic type τ) by semantic term ψ (of semantic type τ) in semantic term ϕ is the result of replacing by ψ every free occurrence of x in ϕ; the substitution is free if and only if no semantic variable becomes bound in the process of replacement. *A semantic form* is a semantic term with no free variables.

A *semantic interpretation* comprises a semantic structure $\{D_\tau\}_{\tau\in \mathbf{T}}$, a *semantic assignment* g mapping from each $\mathbf{V}_\tau$ into D_τ, and a *semantic valuation f* mapping from each $\mathbf{C}_\tau$ into D_τ such that:

(39) $f(\vee)(m) = m' \mid \rightarrow m \cup m'$
$f(\&)(m) = m' \mid \rightarrow m \cap m'$
$f(\rightarrow)(m) = m' \mid \rightarrow (\{\emptyset\} \backslash m) \cup m'$
$f(-)(m) = \{\emptyset\} \backslash m$
$f(\forall)(m) =$ Intersection of $m(m')$ for all $m' \in D_e$
$f(\exists)(m) =$ Union of $m(m')$ for all $m' \in D_e$
$f(\iota)(\{m\}) = m$

The *semantic value* $[\phi]_f^g \in D_\tau$ of a semantic term $\phi \in \Phi_\tau$ with respect to a semantic interpretation with semantic assignment g and semantic valuation f is defined by:

(40) $[x]_f{}^g = g(x)$ for $x \in \mathbf{V}_\tau$
$[c]_f{}^g = f(x)$ for $c \in \mathbf{C}^\tau$
$[(\phi\ \psi)]_f{}^g = [\phi]_f{}^g([\psi]_f{}^g)$ functional application
$[\pi_1\phi]_f{}^g = \mathbf{fst}([\phi]_f{}^g)$ first projection
$[\pi_2\phi]_f{}^g = \mathbf{snd}([\phi]_f{}^g)$ second projection
$[\lambda x_\tau\phi]_f{}^g = D_\tau \ni m \mid \rightarrow [\phi]_{f^{(g-\{<x,\ g(x)>\}\cup\{<x,\ m>\}}}$ functional abstraction
$[(\phi, \psi)]_f{}^g = \langle [\phi]_f{}^g, [\psi]_f{}^g \rangle$ pair formation

Note that, the semantic value of a semantic form is invariant with respect to semantic assignment.

Two semantic forms ϕ and ψ are *equivalent*, $\phi \cong \psi$, if and only if $[\phi]_f^g = [\psi]_f^g$ in every semantic interpretation. We have:

(41) $\lambda x\phi \cong \lambda y(\phi\{y/x\})$ α-conversion
provided y is not free in ϕ and $\phi\{y/x\}$ is free
$(\lambda x\phi\ \psi) \cong \phi\{\psi/x\}$ β-conversion
provided $\phi\{\psi/x\}$ is free
$\pi_1(\phi, \psi) \cong \phi$
$\pi_2(\phi, \psi) \cong \psi$
$\lambda x(\phi\ x) \cong \phi$ η-conversion
provided x is not free in ϕ
$(\pi_2\phi, \pi\phi) \cong \phi$

Syntax

The set **F** of syntactic types is defined on the basis of a set **A** of atomic *syntactic types* as follows:

(42) $\mathbf{F} ::= \mathbf{A} \mid \mathbf{F}\bullet\mathbf{F} \mid \mathbf{F}\backslash\mathbf{F} \mid \mathbf{F}/\mathbf{F}$

Let there be a basic type map t mapping from **A** into **T**. This induces the type map T from **F** into **T** such that:

(43) $T(P) = t(P)$ for $P \in \mathbf{A}$
$T(A\bullet B) = T(A)\&T(B)$
$T(A\backslash C) = T(A)\rightarrow T(C)$
$T(C/B) = T(B)\rightarrow T(C)$

A *syntactic interpretation* comprises a prosodic structure $(L, +)$, a semantic structure $\{D_\tau\}_{\tau_e\mathbf{T}}$, and a syntactic valuation F mapping each $P \in \mathbf{A}$ into a subset of $L\times D_{t(P)}$. Then the *syntactic value* $[\,[A]\,]_F$, a subset of $L\times D_{T(A)}$, for each syntactic type A is given by:

(44) $[[P]]_F = F(P)$ for $P \in \mathbf{A}$
$[[A\bullet B]]_F = \{(s_1+s_2, \langle m_1, m_2\rangle) \mid (s_1, m_1)\in[[A]]_F$ and $(s_2, m_2)\in[[B]]_F\}$
$[[A\backslash C]]_F = \{(s, m) \mid$ for all $(s', m')\in[[A]]_F$, $(s'+s, m(m'))\in[[C]]_F\}$
$[[C\backslash B]]_F = \{(s, m) \mid$ for all $(s', m')\in[[B]]_F$, $(s+s', m(m'))\in[[C]]_F\}$

A semiotic interpretation comprises a prosodic interpretation, a semantic interpretation, and a syntactic interpretation, with the same prosodic and semantic structures. A *type assignment statement* $\alpha-\phi$: A comprises a syntactic type A, a semantic form ϕ of type T(A) and a prosodic form α. A *semiotic interpretation satisfies a type assignment statement* $\alpha-\phi$: A if and only if $\langle[\alpha], [\phi]\rangle\in[[A]]$. A semiotic interpretation *satisfies a set Σ of type assignment statements* if and only if it satisfies every type assignment statement $\sigma\in\Sigma$. A set σ of type assignment statements *models* a type assignment statement σ, $\Sigma\mid=\sigma$, if and only if every semiotic interpretation that satisfies Σ satisfies σ. A lexicon comprises a set of type assignment statements. The *language model* $L(\Sigma)$ defined by a *lexicon* Σ is the set of all type assignment statements that Σ models:

(45) $L(\Sigma) = \{\sigma \mid \Sigma\mid=\sigma\}$

This is like the declarative semantics of logic programs wherein the meaning of a program is the set

of all ground atoms which it entails, or a logical theory which is the set of all consequences of an axiomatization.

For example, the language model defined by the lexicon (46) includes the type assignment statements in (47):

(46) **cat**–*cat*: CN
likes–*like*: (N\S)/N
Mary–*m*: N.
sleeps–*sleep*: N\S
that–$\lambda x \lambda y \lambda z((\& \ (y \ z)) \ (x \ z))$: (CN\CN)/(S/N)
that–ι: N/CN

(47a) **the** + **cat** + **sleeps**–(*sleep* (ι *cat*)): S
(47b) **that** + **Mary** + **likes**–$\lambda y \lambda z((\& \ (y \ z))$ $((like \ z) \ m))$: CN\CN

Categorical Perception in Animals

J Fischer, German Primate Center, Goettingen, Germany

© 2006 Elsevier Ltd. All rights reserved.

The label 'Categorical Perception' (CP) is commonly used to describe the observation that continuous variation in a sensory stimulus is recoded into discrete categories. The classic example is the distinction of voiced and voiceless plosive consonants, such as /da/ and /ta/. These phonemes are mainly but not exclusively distinguished by the time lag between the plosive burst and the onset of voicing, i.e., the so-called 'voice onset time' (VOT). Although VOT may vary continuously between negative values – the voicing begins before the plosive burst – to positive values – the voice sets in after the plosive sound – listeners typically sort these phonemes into one category or another. Such effects have become known as Categorical Perception, although CP may involve not only perceptual categorization, but also categorization of mental representations, and decision-making processes.

Over time, the operational definition of CP has changed from a restrictive view to a more general one, and this has led to some dispute over which findings constitute examples of CP. A conservative definition of CP requires the fulfillment of four criteria: (1) distinct labeling of stimulus categories; (2) failure to discriminate within categories; (3) a

of all ground atoms which it entails, or a logical theory which is the set of all consequences of an axiomatization.

For example, the language model defined by the lexicon (46) includes the type assignment statements in (47):

(46) **cat**–*cat*: CN
likes–*like*: (N\S)/N
Mary–*m*: N.
sleeps–*sleep*: N\S
that–$\lambda x \lambda y \lambda z((\& \ (y \ z)) \ (x \ z))$: (CN\CN)/(S/N)
that–ι: N/CN

(47a) **the** + **cat** + **sleeps**–(*sleep* (ι *cat*)): S
(47b) **that** + **Mary** + **likes**–$\lambda y \lambda z((\& \ (y \ z))$ $((like \ z) \ m))$: CN\CN

Categorical Perception in Animals

The label 'Categorical Perception' (CP) is commonly used to describe the observation that continuous variation in a sensory stimulus is recoded into discrete categories. The classic example is the distinction of voiced and voiceless plosive consonants, such as /da/ and /ta/. These phonemes are mainly but not exclusively distinguished by the time lag between the plosive burst and the onset of voicing, i.e., the so-called 'voice onset time' (VOT). Although VOT may vary continuously between negative values – the voicing begins before the plosive burst – to positive values – the voice sets in after the plosive sound – listeners typically sort these phonemes into one category or another. Such effects have become known as Categorical Perception, although CP may involve not only perceptual categorization, but also categorization of mental representations, and decision-making processes.

Over time, the operational definition of CP has changed from a restrictive view to a more general one, and this has led to some dispute over which findings constitute examples of CP. A conservative definition of CP requires the fulfillment of four criteria: (1) distinct labeling of stimulus categories; (2) failure to discriminate within categories; (3) a

Figure 1 Idealized labeling and discrimination functions. (Top) The graded continuum between the two end-points 0 and 10 is partitioned into two categories, A and B. The labeling function is nonlinear. (Bottom) Discrimination function for discrimination of stimuli that fall within a category (e.g., 2 and 3) and across categories (e.g., 5 and 6). The same physical variation may be difficult to distinguish when it falls within a category and easy to distinguish when it straddles the category boundary.

Figure 2 Mean percentage of /d/ responses by chinchilla and human subjects to synthetic speech sounds simulating a continuum ranging from /da/ to /ta/. The animals had been trained on the end-points of the continuum (0 and +80 ms VOT) and then tested with stimuli ranging from +10 to +70 ms. discrimination peak at the category boundary; and (4) a close agreement between labeling and discrimination functions (Studdert-Kennedy *et al.*, 1970; see Figure 1). More loosely, CP has been defined as a compression of within-category and/or a separation of between-category differences (Harnad, 1987). Correspondingly, so-called 'perceptual anchors' or 'prototypes' refer to the compressed region within a category, whereas 'boundary effects' occur when a given variation of a stimulus is reported as the 'same' when it lies within a category and is reported as 'different' when it straddles the boundary between two categories (Kuhl, 1991).

In the auditory domain, CP was initially believed to be restricted to the perception of speech sounds and considered to be special to speech (Liberman, 1957). This claim sparked interest in the question of whether animals would exhibit CP of human speech tokens (Kuhl, 1987). In an influential study, Kuhl and Miller (1975) trained chinchillas (*Chinchilla chinchilla*) to discriminate between different human speech tokens. Subjects were trained to distinguish the end-points of the voiced–voiceless continuum between /da/ and /ta/. VOT in these experiments ranged between 0 and 80 ms. In the test trials, animals placed the phonetic boundary at approximately 40 ms (Figure 2) and they also extended their generalization to other consonants differing with regard to VOT (Kuhl and Miller, 1978). Similarly, Morse and Snowdon (1975) demonstrated CP of speech tokens in rhesus monkeys (*Macaca mulatta*). The finding that animals perceived the phonetic boundaries in similar places as English-speaking people initially led to the hypothesis that the observed boundaries may be innate and linked to the mammalian auditory system. However, category boundaries have been shown to be flexible and variable across different languages (Repp and Liberman, 1987). More importantly, a number of animal studies indicated that they may exhibit CP of their own sounds. These findings support the view that categorical boundaries are not innate, but are established through experience.

Several studies employing operant training procedures revealed that nonhuman primates show CP of certain features of their own species' vocalizations (e.g., May *et al.*, 1989). Moreover, a number of studies investigated animals' **natural** responses to graded variations of their own sounds. Female mice reliably responded with retrieval behavior to variations of ultrasonic pup vocalizations that fell within the natural range of the frequency bandwidth, but there was a distinct drop in the propensity to respond to calls whose bandwidth exceeded the category boundary (Ehret and Haack, 1981). Snowdon and Pola (1978) showed that the pygmy marmoset (*Cebuella pygmaea*), a New World monkey, responded in a categorical fashion to the playback of synthetic

Figure 3 Proportion of stimulus presentations that were followed by a pygmy marmoset emitting a closed mouth trill (CMT) within 5 s of the playback of a closed mouth trill, in relation to trill duration. NULL represents the response when no auditory stimulus was presented. Figure 4 Looking time after playback of a series of Barbary macaque shrill barks given to two different disturbances, human observers and dogs. Graphs depict habituation in response to repeated presentation of calls given in response to observers. In the test, either a call given in response to a dog (A) or a novel call given in response to the observer (B) was played. Test stimuli differed from habituation stimuli by similar acoustic amounts, measured in terms of scores derived from a multivariate acoustic analysis. Unpublished material from Fischer (1996).

modifications of single acoustic parameters in their trills (Figure 3).

A further set of studies adopted a specific playback technique, the 'habituation–dishabituation' paradigm (also 'habituation–recovery'; Fischer *et al.*, 2001) previously used in human infant research (Fantz, 1964; Eimas *et al.*, 1971). With this technique, a series of stimuli is presented until the subject ceases to respond. Subsequently, a putatively distinct stimulus is presented. A recovery in response suggests that this stimulus is placed in a different category than those used for habituation, whereas a failure to respond to this test stimulus suggests that it is placed in the same category as those used for habituation. Using this method, Nelson and Marler (1989) studied swamp sparrow (*Melospiza georgiana*) responses to variation in note duration, a feature characteristic for different populations of this species. In these experiments, animals showed renewed territorial responses only when the note duration was switched to a length of the other category, whereas they failed to do so when the same absolute variation fell within a given category. Crickets (*Teleogryllus oceanicus*) exhibit categorical perception of the frequency of tones, depending on whether they fall in the species-specific range or whether they simulate the presence of bats, one of their main predators (Wyttenbach *et al.*, 1996). Fischer (1998) also adopted the habitation–dishabituation paradigm and demonstrated that Barbary macaques (*Macaca sylvanus*) responded in a categorical fashion to continuous variation between two subtypes of alarm calls (Figure 4). These calls varied with regard to a suite of variables. Experience with the population-typical variants of calls appeared to influence the categorization of sounds, supporting the view that experience with the stimuli can influence the location of category boundaries. Interestingly, baboons showed continuous responses to the graded variation between two subtypes of their loud calls (Fischer *et al.*, 2001).

Both methodological approaches to the study of CP in animals – operant conditioning and observation of natural responses – have been criticized for methodological shortcomings: Studies that employed operant conditioning may have established categories through the training, and therefore the observed categorization may simply be an outcome of generalization of the training stimuli. On the other hand, those studies that relied on natural responses could not demonstrate that subjects were **unable** to distinguish between categories (Snowdon, 1979). Accordingly,

Nelson and Marler (1990) concluded that studies involving operant conditioning were aimed at identifying the 'just noticeable difference' (*jnd*), whereas those relying on the animals' natural responses identified the 'just meaningful difference' (*jmd*), and it has been suggested that the term 'categorical responses' be used for the latter and the term 'categorical perception' be reserved for the former.

Irrespective of the actual label used, however, it seems warranted to conclude that nonlinear responses to continuous variation in sound features are common among species from a variety of taxa, including insects, rodents, birds, and nonhuman primates. This finding supports the view that CP in the broad sense is an expression of categorical effects in the perception and representation of biologically meaningful stimulus variation.
